Trial shipments of ore from the Bullion mine of the Cataract group, near Basin, are reported showing favorable results, and contracts for further development work will be let. It is said a concentrator will be built to work the second-class ores of the Gray Eagle mine. A car of ore from the Silversmith netted \$3300. Regular shipments are being made from the Hiawatha.

LEWIS AND CLARKE COUNTY.

The Inter-Mountain says Martin & Canol of Helena are working several properties near Helena. From the group in Hell Gate canyon, which they have been working for three years, they have shipped in the last four months \$10,000 of ore which runs 20% copper. A concentrator is being built at the mines to work the second-class ore, which runs 10% copper, of which there are several thousands tons on the dump. It is expected to be in operation by June 10. The ore shoot averages 18 feet in width with 5 feet of shipping ore. Martin & Canol are also working on the Missouri & Montana Co. group (formerly the Sure Thing mine), adjoining the Ontario in Ontario district. It has been developed by a 700-foot tunnel run on the lead and the ore stoped to the surface, the greatest depth attained being 90 feet. A steam plant has been put up and a double-compartment shaft is being sunk, which is 80 feet below the tunnel. At 100 feet a crosscut will be run to the vein 20 feet and drifted both ways. The ore runs \$30 a ton and as soon as the roads are in condition shipping will begin, as

there is \$15,000 worth of ore broken in the old workings.

Placer miners of Alder gulch are preparing for a busy season, says the Madisonian. L. A. Fenner has begun operations on his ground. The Fenner washer has been repaired. Mr. Fenner and his sons are stripping ground.

J. Garrison has begun work on the Duncan, Garrison & Fehring ground at Adobetown.—The Consolidated Fluming Co. have begun operations with a few men, but will increase the number if the water starts.—J. Wilson is mining at the mouth of Hungry hollow.

H. White & Co. are leasing the Elling diggings above Pine Grove.—There is more snow on Mount Baldy this spring than for many years back. Under ordinary weather conditions, the flow of water will continue longer this year than usual.

The dredgers at the mouth of Alder do not depend on the water conditions for a successful season's work. Two of them have been running nearly a month, and the other, No. 2, will begin about May 15.

MADISON COUNTY.

The Gordon dredger has begun work for the season on the Conrey placers near Virginia City, and the second dredger will be placed in operation by May 15. The Chicago M. & D. Co. has started its dredgers in the Alder gulch placers.

The Granite Mountain M. Co., which owns fourteen patented claims in Summit district, near Virginia City, after an idleness of ten years, has resumed development work. A contract has been let to sink 200 feet on the J. T. C. mine, adjoining the Kearsarge. Much other work is contemplated in the district this season.

Thirty-five men are developing the Galena mine, near Pony, and a good tonnage of ore is being shipped.—The Red Bluff M. Co. has overcome the water question and are producing sufficient ore to keep its mill in operation.—At the Clipper, in same district, forty men are at work taking out ore of shipping grade.

MISSOULA COUNTY.

Missoula reports say the mines of the Bitter Root C. M. Co., at Saltese, are being examined by E. P. Gilman of London, Eng., for a Scotch company.

POWELL COUNTY.

Canol & Martin are resuming work on the Snow Shoe mine in Snow Shoe gulch, near Elliston, and expect to begin shipments this month. They will also ship from the Alice mine in Basin gulch, same district.

A. B. Clark and E. H. McDonald of Butte, M. S. Bradley and E. R. Woodlee of Chicago, Ill., are locally reported considering building a concentrating plant at Emery. Besides ore on the Emery Co. dump that could thus be profitably treated, there are several prospects yielding ore not high enough in grade for shipment, but could be treated by a concentrating plant.

SILVER BOW COUNTY.

Butte reports say the construction in Butte of a zinc smelter to treat the ores of that and adjoining camps that carry values in that metal is proposed, W. A. Clark and others being interested. Superintendent M. Buckley says Clark's Travonia mine would yield 500 tons per day of zinc ore. It is claimed that a number of mines that run heavily in zinc could be profitably worked, as they also carry by-products of gold, silver and lead.

At Rocker the Anaconda Co. has in operation a mine timber framing plant, which consists of a sawmill and other machinery especially designed for framing timbers for their mines there. The timber is unloaded from the cars at the plant and out and dressed to comply with the directions received from the mine in which it is to be used, the company thus saving the expense of hauling the useless portions of the timber up the Anaconda hill and then hauling down the waste. At Rocker the waste is burned in the boiler room furnaces. There are twelve men employed, with H. Crangle as foreman.

NEVADA.

ELKO COUNTY.

California men have bought the Enright group of mines, 100 miles north of Elko, and will develop the property.

ESMERALDA COUNTY.

In the Atwood district, 30 miles north of Luning, the principal work is being done by the Sierra Vista G. M. Co., composed of Tonopah men, with T. L. Oddie president. The company owns eight claims, says the Tonopah Miner. A shaft has been sunk 60 feet on a ledge of oxidized material which shows values in free gold, with a trace of silver. The extension of this group is owned by D. S. Cohn et al., who, in addition to free-milling gold, report having a vein showing values in copper and silver.

LINCOLN COUNTY.

V. A. Macdonald, vice-president of the

Providence E. & D. Co., has bonded the Juniper and Chiquita groups of mines in Newberry district, near Searchlight, and operations have begun.

NYE COUNTY.

The Teete River Placer M. Co. has incorporated at Tonopah to pipe water 16 miles for mining purposes.

High-grade ore is reported struck in the Ohio Tonopah mine at Tonopah, the strike being made at a depth of 735 feet in the shaft.

Manager M. J. Sheridan of the Rescue M. Co., at Tonopah, says the hoisting plant, consisting of a 45 H. P. steam engine and a 70 H. P. boiler, is in operation, and the two-compartment shaft is down 200 feet. The bottom of the shaft is in porphyry, showing assays of \$2 in gold.

The Pequot M. Co. will begin operations on their claims on Lone mountain, near Tonopah, by the 15th inst. On one of the claims a shaft 80 feet deep has been sunk and a 3-foot vein cut that carries \$60 per ton in gold and silver.

Sinking was resumed in the Montana-Tonopah last week and the main shaft is down 550 feet. Crosscutting and drifting continues at the 500 level. All the available recesses of the mine are filled with sacked ore and shipments will be made to the smelters at Salt Lake City, Utah. The shaft is being wired and arrangements made to put in an electric drill. The drill will be used in the crosscut and drifts.

At the Ray Extension mine, at Tonopah, a 22 H. P. hoist is being set up, and development work will resume next week. The shaft is down 100 feet in a contact between lime and quartzite.

At the Belmont, at Tonopah, the drift at the point of the strike made last week is in ledge matter a distance of 20 feet and the face is in ore running \$100 per ton, says the Miner.

A 60 H. P. steam hoist has been put in at the Golden Anchor mine, near Tonopah.

STOREY COUNTY.

An examination of the Forman shaft at Gold Hill from the surface shows that the damage to the timbering was not serious, only a few sets below the collar having been charred by the fire that destroyed the hoisting works. An inspection from the Suro tunnel south lateral branch showed the shaft in sound condition from that depth, no obstruction being visible from the tunnel floor to the surface. The castings of the hoist and pump plants are being broken up with powder to admit of removing the brass and copper bearings.

WASHOE COUNTY.

At the Silver Hill mine, near Reno, 270 tons of ore milled returned gold valued at \$4528 54. J. Kyle is superintendent.

NEW MEXICO.

GUADALUPE COUNTY.

The Missouri Oil & Asphaltum Co. are drilling for oil near Santa Rosa, with J. H. Chamberlain as superintendent.

SOCORRO COUNTY.

Operations will be resumed on the Graphic group of mines, near Magdalena, by C. T. Brown of Socorro and A. B. Flitch, who has had a lease on the Graphic mines for several years. A mill of at least fifty tons daily capacity will be built.

OREGON.

BAKER COUNTY.

(Special Correspondence).—E. W. Mueller, general manager of the Oregon S. & R. Co. of Sumpter, has leased the Baker City Sampling Works, and they will be operated by the Smelting Co. This places the Smelting Co. on a through line of transportation, and gives it the advantage of a depot and warehouse at the terminus of the Sumpter Valley Railroad, which reaches its property here. It also affords means of caring for consignments in less than carload lots, and affecting a settlement with the owner of the ores shipped to the smelter before they reach the destination. The plant is to be enlarged. The smelter is completed and will blow in as soon as the siding from the Sumpter Valley Railroad is completed.

R. J. Sorensen, president of the Highland Gold Mines Co., reports a rich ore shoot 3 feet wide, found 30 feet from the point where the Bannockburn crosscut opened the vein. In the drift on the shoot a medium-grade milling ore was passed through. This was darker than the high-grade stuff and showed more iron. The shoot is 3 feet wide, and as the work goes ahead is spreading across the drift. The 3 feet averages \$30 per ton.

Sumpter, Or., May 5.

A. Burch of Spokane, Wash., having a bond on the Independence mine, near the Magnolia, near Sumpter, has men at work and a contract for 400 feet of tunnel has been let.

E. S. Toppling, having a bond on the Forty-nine Jimmie, in Greenhorn district,

near Sumpter, says beaver pumps are being put in to handle the water, which was gaining on them.

A. J. Trimble, secretary of the Annalulu mine, in Cracker Creek district, near Sumpter, says operations will be started by June 1. The Annalulu group is on the Cracker Creek vein system, adjoining the Golconda.

The Auburn placers, 16 miles from Sumpter, on the Baker City road, owned and operated by the Auburn Deep M. Co., were started up last week. Men are at work putting in foundations for pumps, shaft house and hoist. The company has a shaft down 95 feet and is sinking for bedrock. It is thought the shaft may have to go down 200 feet.

The Golden Wizard Co., near Sumpter, will put in a 1000-gallon station pump on the 300-foot level, says Superintendent McPhee, and development work is being done, exploring the ore bodies and getting the mine ready for the mill, which it is expected will be built in the fall.

A. P. Jones, president and manager of the Lucky Boy G. M. Co., near Sumpter, has started operations. The Lucky Boy group is $\frac{1}{2}$ mile south of the Bonanza. Bonanza district, and includes five full claims, with plenty of timber near by.

A. G. Hanauer of Spokane, Wash., and Eastern associates have bought the Victor group, in Cracker Creek district, and development work is being done, with A. Geiser as superintendent. The Victor group represents five full claims. A tunnel will be run on the Cracker Oregon extension for 800 feet to tap the vein, and a shaft is being sunk. At a depth of 100 feet the ledge will be crosscut and the ore bodies explored. A compressor plant will be put in.

DOUGLAS COUNTY.

Manager F. Stull of the Red Bean mine, 16 miles from Glendale, says they are taking out free milling ore which runs \$20 per ton in gold.

JACKSON COUNTY.

The Eureka quartz mine, on Steamboat creek, one of the larger tributaries of the upper Applegate river, near Jacksonville, is being worked by G. S. & J. M. Bristol, A. Wakefield, W. H. Mowatt, J. L. Fenton and A. Ahlstrom of Ashland, owners. The vein is showing a width of 18 inches and assays \$100.

JOSEPHINE COUNTY.

J. G. Hayden is working his quartz mine on Galice creek, near Placer, and handling the ore in an arrastra, water power being used. The vein has an average width of 20 inches and runs \$20 per ton. The ore carries some sulphurets.

Superintendent C. D. Crane has seven men at work at the Lucky Queen mine, Jump-off-Joe district, near Merlin, being operated under a bond held by W. F. Harrington of Ashland. A tunnel has been run to connect with a winze of the old workings. Another tunnel is being run which will tap the ledge at a depth of 70 feet.

SOUTH DAKOTA.

CUSTER COUNTY.

It is reported negotiations are pending for the transfer of the Grand Junction mines near Custer.—The Black Hills Porcelain Clay & Marble Co. shipped another carload of mica to the Eastern market last week. Work is to be started this month on the lithographic stone and marble.—Many of the quartz miners have abandoned their lode mining and are working the placer diggings in several districts in this county, which can only be worked during the freshest season, owing to the absence of water at other times.

Ore carrying a high percentage of tungsten is reported found by W. H. Walling and T. Bowns in this county. The ore also carries some gold.

LAWRENCE COUNTY.

The mines of the Wasp No. 1 M. Co. of Yellow creek, south of Lead City, have been sold to Manager W. R. Dickinson of an Eastern company for \$40,000. Also, a bond is to be taken on the Wasp No. 2, the McShane group and several others, which in all will cover the principal part of the Yellow Creek district, the deal involving a total of \$850,000.

The Custer Peak M. Co., near Roubaix, have men at work at several points on their ground, the principal work being development in the Custer Peak shaft on the Wilson Merritt lode. A ledge of free milling and concentrating ore is being opened up, running \$3 per ton in gold.

The St. John's mine in Custer Peak district, near Roubaix, is being developed by J. Cusick & Co. under bond. They have a large body of free milling gold ore and intend to build a mill.

MEADE COUNTY.

C. H. Miller has a claim 3 miles northwest of Sturgis which contains a ledge with values in cobalt, says the Black Hills Mining Review. There are 140 acres, across which the ledge runs, but some of

the best matter seems to be on the Government reservation for Ft. Meade. The ore runs $3\frac{1}{2}\%$ cobalt, \$2.40 in gold and 60 cents in nickel per ton.

TENNESSEE.

KNOX COUNTY.

D. Baldwin of Cleveland, O., has bought 2000 acres of zinc lands and taken options on a number of other tracts in the zinc belt, near Knoxville. He says he has made arrangements for the erection of a smelter, work to begin this month. Associated with him are Connecticut men, H. C. Evans and W. Adams of Chattanooga, Tenn.

TEXAS.

EL PASO COUNTY.

The Federal smelter at El Paso is arranging to make additional improvements in the plant, work on which will begin by June 1. The capacity was doubled the past winter. The proposed addition, says President Jaycocks, will include a converting furnace, which will equip the plant for turning out copper pigs. The company has bought and leased several mines—some in Mexico. The company has 400 men at work at the smelter.

UTAH.

BEAVER COUNTY.

G. L. Brown, secretary of the Beaver G. & C. Co. of Salt Lake City, has been given an option on the Beacon mine in South Star district, near Milford, for \$35,000. Developments of the past three months include running a tunnel to intersect an incline in which they cut through 20 feet of copper sulphides, carrying $12\frac{1}{2}\%$ copper. In sinking a winze on this body of ore the foot wall was cut through and it proved to be but a casing of lime, beneath which is a body of lead carbonates, carrying 30% lead, says the Milford Times. Development work will continue in the winze and tunnel.

JUAB COUNTY.

The Uncle Sam Con. mine in Tintic district, near Eureka, will have a 50-ton concentrating plant, say President Dern and Manager Chipman. It is proposed to locate the mill at the mine. The mine has a body of low-grade ore which cannot be shipped at a profit.

A total of 137 carloads of ore were shipped from Tintic last week, the heaviest shippers being the Centennial-Eureka, Grand Central, Dragon Iron and Gemini mines. The United Sunbeam was added to the list. This makes a total of 643 cars shipped during April.

The shipment of a 33-ton lot of ore by the Little Chief contained 40% lead, 33 ounces silver and \$3 in gold.

The shaft on the Dagmar-Northwest mine is to be sunk to the 500 level and two shifts are at work, says Superintendent G. Adams.

The work of pumping out the South Swansea mine at Silver City is progressing satisfactorily. The water line is 80 feet below the 700 level.

SALT LAKE COUNTY.

The Sampson group of mines near Bingham, under bond to the Bingham Con. Co., is to increase its output to 100 tons daily.—It is understood the Highland Boy mine at Bingham will this month increase its shipments to 600 tons daily.

SUMMIT COUNTY.

The Daly-Judge mill at Park City is shut down pending the setting up of additional machinery which is expected to increase its capacity to 400 tons daily. The new machinery consists of a number of jigs and table concentrators, and a set of slime tanks. Development in the mine will go on as usual and the ore will be shipped to the American Smelting Co.'s plant in the valley.

TOOELE COUNTY.

Secretary Ellingwood says on account of the large flow of water in the Honerine tunnel at Stockton, headway is being made at the rate of only 3 feet per day, instead of 10 feet as formerly. The flow of water has as yet had no very noticeable effect at the Honerine mine, though the Bullion has been entirely drained and work in the mine resumed. At the Black Diamond, also, the water is lowering and development there can be taken up again. The drain tunnel will continue ahead.

The compressor plant at the Honerine tunnel, near Stockton, is in operation.

WASHINGTON.

OKANOGAN COUNTY.

In the Nespelem district, in the south half of the Colville reservation, J. P. Turner of Spokane says mining activity is increasing. The Apache mine shipped fifteen tons of ore last week, netting the owners \$10,000 in silver and gold. The Hilo, Double Header, Little Chief and a number of others are working. These mines are on the mountain above the Nes-

pelem river, near Nespelem, and near them are high falls, which furnish water power.

STEVENS COUNTY.

The supply of coke at the Northport smelter has been supplemented during the week, with the result that the furnaces are in operation. The plant has received a small quantity of Fernie coke, which has been in transit for some time, but no considerable supply from East Kootenay is yet in sight, so far as the Northport works are concerned, although the plants on the Canadian side are well supplied.

WYOMING.

LARAMIE COUNTY.

President J. A. Keblor of the Colorado Fuel & Iron Co. of Denver, Colo., says the company is preparing to build a \$300,000 railroad, a \$35,000 steel head-frame for the automatic handling of ore, an ore crusher and will open up their beds of iron ore near Sunrise. The steel head-frame is similar to those used in the iron regions of Michigan. A shaft will be sunk to reach the lower levels in the mines. The frame consists of an automatic loading arrangement which hoists the ore above the plant at the top of the shaft. The ore then passes down by gravity through the crusher and is loaded into cars automatically. The railroad, which will be 7 miles long, will run from Hartville to the Chicago mines, which are also to be opened and developed. Altogether it is expected the company will spend \$500,000 in developing that section to supply the increased demand for their plant at Pueblo, Colo.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The newly formed Provincial Mining Association, through its executive, have proposed certain amendments to the Placer Mining Act. The character of these amendments is rather to contract than to expand the provisions of the Mining Act. As a tax must be levied somewhere, and as it is proposed to remove the 2% tax from the mines, the prospector seems to be the individual that must in every case make up the shortage. The "one claim, one year" provision prevails in the proposed amendment. Every creek and placer claim is to be taxed 50 cents per acre. This tax must be paid before May 31 in each year. Five hundred dollars is the minimum of assessment work and \$2000 the maximum with \$5 per acre. Certain reservations for rights of way and drainage are made. On the whole, the proposed amendments are against the individual prospector and are in favor of companies and consolidation.

Victoria, B. C., May 4.

(Special Correspondence).—Mineral production up to 1900: The statistics show gold placers, \$62,584,443; gold, lode \$2,812,860; silver, \$13,649,809; lead, \$7,619,956; copper, \$1,362,583; coal and coke, \$49,140,917; building stone and structure materials, \$1,950,000; other material, \$34,640. Total for the province in all years, \$152,155,208. If to the above total of \$152,155,208, the production for 1901 and 1902 be added, the entire total will be found to approximate \$190,000,000 for British Columbia alone.

Victoria, May 4.

W. P. Pool has bonded the Homestake, Idaho and Detroit claims for \$100,000. They are near the Oyster-Criterlon and Eva mines, near Lardeau.

The Marble Bay mine at Texada, owned by the Tacoma Steel Co., is closed down for three weeks, while a more powerful hoisting plant is being put in. Meanwhile shipments from the dump, owned by J. J. Palmer, will continue.

K. Neitzel and O. J. Johnson of the St. Eugene Mountain mines, Ltd., near Fort Steele, are stripping the ledge on the Mountain Goat claim of the group and report favorable prospects.

It is announced that the Dominion Government will increase the bounty on lead ores.

The Fern mine, near Nelson, has again entered the shipping list, says Manager Rammelmeyer, and he intends to start up the mill this week.

The Wilcox mine at Ymir has resumed after a shut down of a few weeks, as supplies could not be gotten in over the accumulation of soft snow, which blocked the wagon road. The road is now passable for pack train.

The foundations were started last week for a slimes treatment plant at the smelter at Trail, says the Trail News. Silver slimes, similar to those produced in copper refining, are turned out in connection with the electrolytic refining of lead, and these were formerly shipped to the United States for treatment. They contain gold and silver, combined with arsenic, antimony and other impurities occurring in the lead bullion. When in operation, this

plant will turn out silver, gold, copper sulphate and either metallic antimony or antimonial lead.

One provision of the new Act for the amendment of the Coal Mines Regulation Act, introduced in the Provincial Parliament, which has passed its third reading, is as follows:

"Rule 34. No Chinaman or person unable to speak English shall be appointed to or shall occupy any position of trust or responsibility in or about a mine subject to this Act, whereby through his ignorance, carelessness or negligence, he might endanger the life or limb of any person employed in or about the mine, viz., as banksman, onsetter, signalman, brakesman, pointsman, furnaceman, engineer, or be employed below ground or at the windlass of a sinking pit."

CANADA.

ALBERTA.

A. E. Spriggs, associated with H. L. Frank, owner of the coal mines at Frank, wires the Butte, Mont., Inter Mountain that the rockslide destroyed a few cottages and some outside machinery at the mine entrance, the damage being overestimated. The fatalities number seventy, consisting of four miners, nineteen top laborers, twenty railroad laborers and twenty-seven women and children, who were in cottages. Everybody in the mine escaped uninjured and the mine workings are intact. Operations at the mine will be resumed as soon as the railroad gets in equipment.

KLONDIKE.

Dawson reports say that the Arizona Creek district—comprising Arizona, Hobo and Drapeau creeks—is coming to the front as a producer of placer gold. The territorial engineer brought out the information that pans as high as \$1 have been taken out, the average being 40 cents to the bucket. Arizona creek is 120 miles up the Klondike river from Dawson.

MEXICO.

CHIHUAHUA.

J. I. Long, manager of the Hidalgo M. Co., at Parral, denies the report that the Guggenheims had renewed negotiations for that company's mines, railroad and other interests in the Parral district. The Hidalgo Co. owns seventeen mines in the district, nine of which are in operation. In several of them the water is hard to handle. There are shipped from these mines 6000 tons per month.

Manager E. J. DeWitt is down 140 feet on the San Augustine mine, near Parral, and says he will sink to the 150-foot level, when he will crosscut, and drift on the vein. The ores average \$40 per ton in gold.

Increased activity is reported in Avonces Valles section, 18 miles south of Parral and 3 miles from Cuebas station, on the Mexican Central's extension to Rosario. The Maria mine is shipping regularly. The Mecatona M. Co. will start up next week on the Mecatona mine. J. P. Cruger is working the Los Remedios mine. The Santa Elena M. Co. has a group of three mines and has started work.

The Kansas City, Mexico & Orient R. R. Co., owning mines at Terrazas and Victorino camps, are doing development work.

Boyce & Burnham of Boston, Mass., have bought the Kruger mines at Cusihuirichic.

The Buenos Aires M. Co., W. C. Rollins manager, have completed a Huntington mill at Cusihuirichic, with pan-amalgamation equipment and settling tanks, which is expected to be in operation next week.

C. W. Clark of California has bought the Rosario mine at Guadalupe y Calvo, says F. L. Sizer, consulting engineer. The ore is low grade gold and silver, and the price paid is reported at \$500,000.

DURANGO.

The smelter at the iron mountain, El Cerro del Mercado, at Durango, is producing 22,000 pounds of iron daily.

The Penoles M. Co., near Mapimi, has three copper furnaces in steady operation.

The United Bufo M. Co. has been organized at Durango, and has leased the Armendia and La America mines on the east slope of the Mapimi mountains, and will put in development machinery and reduction works. A road is being built to the mine.

J. R. Lockhart, F. L. Norris and J. F. Frickler of Texas have bought a number of mines at Huahuapan, district of San Dimas, and have organized a company to operate them. It is claimed that one of the mines produces 500 ounces of silver and 3% lead per ton.

GUANAJUATO.

In the Juanita mine of the United States & Mexico M. & D. Co. at San Anton de las Minas, they are sinking a 500-foot vertical working shaft and are down 300

feet. The main pumping station will be on the 350-foot level.

GUERRERO.

Manager J. A. Carroll of the Mitchell Copper Co., operating at La Dicha, says the company propose to run a line of steamers between Acapulco and San Francisco to transport their output. They have 500 men at work around their mines. Hoisting and other machinery will be put in this summer.

NUEVO LEON.

The Monterey Iron & Steel Foundry Co. will build a railroad from Nuevo Laredo to their mines in the San Enrique coal fields near the Rio Grande river.

OAXACA.

The Taviohe M. & M. Co., near Ocotlan, report their mill nearly finished and expect to have it in operation by May 20. It is a concentration and amalgamation plant of 100 tons daily capacity. The ores carry gold and silver values.

SONORA.

The United States Graphite Co. of Saginaw, Mich., Z. T. Rawson, superintendent, has men at work on the Lapiz graphite mine near Minas Prietas. The ore is hauled to the railroad at Torres in wagons, and shipped to the United States for the manufacture of lubricants.

ZACATECAS.

The Nueva Quebradilla M. Co. of Zacatecas has a tunnel 580 meters long in which machine drills are used. These mines had been abandoned twenty-six years.

PERU.

M. J. Lidstone, constructing engineer of the Chiquistambo G. M., Ltd., says they have built a 40 stamp mill to be operated by water power. The ore values are principally in gold. A cyanide plant will be put up later on. The company's mines are 9 miles from Cerro de Pasco, in Junin department.

Books Received.

"The Improvement of Rivers," by B. F. Thomas and D. A. Watt, noted engineers. Under this title has been published a handsome volume of 356 + XIV quarto pages, with 92 full-page illustrations and folding plates. It is a treatise on the methods employed for improving streams for open navigation and for navigation by means of locks and dams. It is the first book on the subject published in the English language, and will prove of great interest and value to engineers everywhere. It deals with the construction of dams, locks, etc., in rivers and canals, of dredging and other methods of excavating, concrete construction, specifications, etc. In fact, the book is complete, and presents the practical experience of a large number of engineers who have undertaken and successfully carried to completion some of the world's greatest work of the character indicated. Cloth, \$6 net; postage 47 cents additional. John Wiley & Sons, New York; Chapman & Hall, London.

"Ancient and Modern Engineering and the Isthmian Canal" is the title of a volume of 473 pages, by W. H. Burr, C. E. It is profusely illustrated and is one of the most complete and thoroughly interesting treatises on the subject of engineering that has been published. The illustrations are half-tones from photographs of the subjects. It describes in detail all that is known of the ancient water systems of Chaldaea and Egypt; the pyramids, obelisks and temples; irrigation on the Nile; the noted ancient arches, etc.; noted structures in which cement and similar material were largely used, as the Appian Way, old Roman walls and arches, aqueducts, etc. A chapter is devoted to bridges, ancient and modern. Water works for cities is also given the space its importance deserves, together with the engineering features of works of this description. The Isthmian canal also receives marked attention, and the book throughout is most instructive and interesting. Price \$3.50 net, postage 27 cents additional. John Wiley & Sons, New York and London; Cunningham, Curtis & Welch, San Francisco, Cal.

Catalogues Received.

"The Excavation of Rock by Machinery" is the title of a pamphlet issued by the Sullivan Machinery Co. It describes their rock drills and paraphernalia, air compressors, receivers, etc., and gives much valuable information on this class of machinery. Office 135 Adams street, Chicago, Ill.

PERSONAL.

J. CULLEN of Butte, Mont., is in San Francisco, Cal.

DANA HARMON, of San Francisco, Cal., is in Utah examining mines.

A. B. DAVIS, of Seattle, Wash., is examining mines near Chloride, Ariz.

Z. KENDALL of Tonopah, Nev., is in San Francisco, Cal., on mining business.

DEW. CLARY of Stockton, Cal., is in San Francisco, Cal., on mining business.

J. S. MURRAY, interested in mines in Shasta county, Cal., is in San Francisco, Cal.

W. S. JORDAN, a mining man of Selma, Fresno county, Cal., is in San Francisco, Cal.

J. L. GRIMES is superintendent of the Barton mine, near Auburn, Placer county, Cal.

K. M. JACKSON, interested in mines in Nevada, is in San Francisco, Cal., on business.

C. M. MYRICK, a mining engineer of San Francisco, Cal., is visiting at Honolulu, H. I.

T. SPELLACY, interested in oil properties near Bakersfield, Cal., is in San Francisco, Cal.

W. B. CURRY AND A. J. KEYS returned last week to Beason, Illinois, from Prescott, Ariz.

M. S. BRADLEY AND E. R. WOODLE of Chicago, Ill., are in Butte, Mont., on mining business.

A. GARR is superintendent of the Bluejay mine (formerly Black Bird), near Winnemucca, Nev.

E. F. FRENDENTHAL, manager Manhattan mines, near Pioche, Nev., is in Salt Lake City, Utah.

J. POUNDSTONE is in San Francisco, Cal., on mining business from Grimes, Colusa county, Cal.

C. WALLER has returned to San Francisco, Cal., from an examination of mines in El Dorado county.

M. P. GILBERT of Tucson, Ariz., is examining a gold-copper property in western Gila county, Ariz.

PRESIDENT J. A. KEBLER of the Colorado Fuel & Iron Co. of Denver, Colo., is in Wyoming on business.

R. E. BORD, interested in mines near Shellville, Sonoma county, Cal., is in San Francisco, Cal., on business.

J. S. GOODWIN, interested in mines at You Bet, Nevada county, Cal., is in San Francisco, Cal., on business.

H. A. SUTTLE has returned to Peoria, Ill., from the mines of the Burlington G. M. Co., near Prescott, Ariz.

J. A. FLEMING, president Black Warrior C. Co. at Black Warrior, Gila county, Ariz., is in Philadelphia, Pa.

W. M. BROWN is mine engineer of the Bismarck-Nugget Gulch Con. M. Co., operating near Sheridan, Mont.

MANAGER G. H. ROBINSON of the Tintic M. & D. Co., Eureka, Utah, is in Butte, Mont., from Salt Lake City, Utah.

F. STULL, manager of the Red Bean mine, near Glendale, Douglas Co., Ore., is at Chloride, Ariz., examining mines.

M. E. JONES of Salt Lake City, Utah, is examining mining properties near Chloride, Kingman and Yuma, Ariz.

M. L. REQUA, president of the Pacific Steel & Wire Co., has returned to San Francisco, Cal., from Los Angeles, Cal.

C. BROWN is superintendent of the Crowned King mine, in the Bradshaw mountains, southeast of Prescott, Ariz.

J. HOOPER of Denver, Colo., has gone to Magdalena, Sonora, Mexico, to take charge of a gold proposition near there.

J. D. COPLIN, general manager Pacific M. & Metals Co., is in Kansas City, Mo., from Tucson, Ariz., on company business.

G. W. WOOD, president of the Flagstaff M. Co., of Ellsworth, is at their mines near Austin, Nev., from New York City.

PRESIDENT LEWIS AND MANAGER FARISH of the Majestic Copper Co. are in Denver, Colo., from Salt Lake City, Utah.

E. P. GILMAN of London, England, and A. Urquhart of Scotland are examining mines at Saltese, Missoula county, Mont.

P. W. FLEMING returned to Tucson, Ariz., last week from an examination of mines in Quijotea district, Pima county, Ariz.

G. R. DUNN of Binghamton, N. Y., interested in the Victor and Sterling mines near Prescott, Ariz., is visiting at the mines.

PRESIDENT DARLING of the Valenzuela M. Co., returned last week to Quartzsite, Ariz., from a trip to Los Angeles, Cal.

L. M. TEALE of Denver, Colo., is superintendent Treasure Hill M. Co. operating at Stockton Hill, near Cerbat, Mohave county, Ariz.

L. H. CARVER, E. M., has been appointed consulting engineer for the American Surface Electrical Railroad Co. of San Francisco, Cal.

J. A. CARROLL, manager of the Mitchell Copper Co., operating at La Dicha, Guerrero, Mexico, is in Chicago, Ill., on mining business.

SUPERINTENDENT R. T. PIERCE of the Crystal Lake G. M. Co. at Lupdy, Mono county, Cal., is in San Francisco, Cal., on business.

At the annual meeting of the Holthoff Machinery Co. of Cudahy, Wis., H. C. Holthoff was elected president and Isaac D. Adler vice-president.

H. D. SMITH, engineer for the Tomboy Gold Mines, Ltd., at Telluride, Colo., has returned to Denver, Colo., from a business trip to San Francisco, Cal.

MANAGER R. M. FOREE the Arizona-Colorado Copper Belt & G. M. & M. Co., operating at Globe, Ariz., is in Denver, Colo., on company business.

W. L. COBB AND W. Q. WRIGHT of San Francisco, Cal., are making an examination of mining property near Fort Jones, Siskiyou county, Cal.

A. D. WARNER of St. Paul, Minn., president of the St. Paul Oil Co., operating at Sunset, Kern Co., Cal., has returned from their oil properties.

A. G. HANAUER of Spokane, Wash., manager of the Victor mine in Cracker Creek district, near Sumpter, Or., is in New York on company business.

F. BLACKWELL of Calumet, Mich., is superintendent of the Northwestern Development Co. gold mines near Lardeau, B. C., vice H. Z. Brock, resigned.

MANAGER J. E. KERR of the Wisconsin and Paxton Oil Companies, operating at Half Moon Bay, San Mateo Co., Cal., is in the East on company business.

H. F. BEST of Savannah, Mo., president and manager Treasure Hill M. Co., operating at Stockton Hill, near Cerbat, Mohave county, Ariz., is at their mines.

J. A. FULLER AND C. D. HANCHETT of Hancock, Mich., have returned from an examination of the mines of the Arizona-Hancock C. Co., near Globe, Ariz.

WM. McFAUL, representing the Rand Drill Co. and the Davis Calyx Drill Co. of New York City, has established an office in the Rialto Building, San Francisco, Cal.

A. J. TRIMBLE, secretary and treasurer the Annalulu mine in Cracker Creek district, near Sumpter, Or., returned last week from a business trip to Chicago, Ill.

D. E. BIGELOW is manager of the Lake View Consols, Ltd., mines at Boulder, West Australia, vice W. A. Pritchard, who is with Bewick, Moreing & Co., Kalgoorlie.

H. A. CLAPP, of Denver, Colo., manager of the Sonora M. Co. of Sonora, Mex., returned to Denver, Colo., last week from an extended trip through Mexico.

R. WALKER, for several years superintendent of the Gold Hill mine, near Grass Valley, Cal., is underground superintendent of the North Star M. Co. in the same district.

SUPERINTENDENT E. E. PARTZ of the Goldwin mine, near Carters, Tuolumne county, Cal., left San Francisco, Cal., for Central America this week on mining business.

R. BLEI, of New York, interested in copper properties near Valdez, Alaska, returned this week from Valdez, and has gone to Cornwall, England, on mining business.

E. F. STAPLES of Baverstock & Staples, assayers of Los Angeles, Cal., has gone to Sonora, Mexico, to close a sale of property in which they are interested, to an English company.

J. L. GLUYAS, for a number of years foreman of the North Star mine near Grass Valley, Cal., is foreman of the Gold Tunnel M. Co., operating near Nevada City, Cal.

T. HOOPER, superintendent Victoria mine, near Mass City, Ontonagon county, Mich., has returned from a trip to Globe, Ariz., in connection with the Arizona-Hancock C. Co.

J. J. MARTIN, manager of a group of mines at Remedios, Colombia, South America, is visiting Grass Valley, Cal., and will go to Colorado before returning to South America.

W. S. GAGE, consulting engineer for G. Mitchell & Co. of Cornwall, England, returned last week to Tacoma, Wash., from Valdez, Alaska, on mining business, and has gone to England.

R. D. GEORGE, Ph.D., Professor of Geology and Petrology, University of Iowa, has been appointed to and accepted

a similar position with the University of Colorado, at Boulder, Colo.

A. B. KNIGHT, formerly professor of civil engineering in the Montana School of Mines, is consulting engineer of the Bismarck-Nugget-Gulch Con. M. Co., operating near Sheridan, Mont.

J. KNOX of Houghton, Mich., former assistant superintendent of the Trimountain mine, is superintendent of the Eva group, owned by the Calumet & British Columbia G. M. Co., near Lardeau, B. C.

R. J. DAVISON, of Bath, New York, president of the Oregon Mines Exploration Co., operating the Snow Creek mine, near Sumpter, Or., and C. M. Brown, of Denver, Colo., are in Sumpter, Or.

WALLACE MACGREGOR, E. M., of Berkeley, Cal., has returned to his home from Costa Rica, C. A., where he has been for some months erecting milling plants on the mines of Abangarez Gold Fields, Ltd., of New York.

HENRY B. KAEDING, E. M., of San Francisco, is in Shasta Co., Cal., examining the property of the May Blossom Copper Smelting Co., together with other mines in the vicinity of Redding, for intending purchasers.

V. A. THORNE of Salt Lake City, Utah, manager of the Daily group of claims in Gambrinus district, near Boise, Idaho, will leave next week for England to confer with the owners of the property in regard to further developments.

M. J. LIDSTONE, constructing engineer, has returned to San Francisco, Cal., from the mines of the Chiquistambo G. M. Co., Ltd., near Cerro de Pasco, Peru, where he has been building a 40-stamp mill for the Union Iron Works of San Francisco, Cal.

W. E. DEFTY, who was injured by falling down a winze in the Las Planchas de Plata mine several weeks ago, is in the field again. He has gone to the Arizpe and Altar districts in Sonora, Mexico, and will go from there to the State of Michoacan.

JAMES McEVOY, consulting geologist Crow's Nest Pass Coal Co. of British Columbia, and for a number of years on the staff of the Dominion Geological Survey, was in Victoria, B. C., May 1. On receipt of news of the Frank disaster, he proceeded to Frank and from there went to Toronto, the headquarters of his company.

Commercial Paragraphs.

THE Allis-Chalmers Co., Chicago, Ill., announce that after May 1, 1903, the general offices of the company will be located in the New York Life Building, fourteenth floor, corner of La Salle and Monroe Sts.

THE Brown Corliss Engine Co. of Corliss, Wis., report receiving an order from the Pfister & Vogel-Leather Co. of Milwaukee, Wis., for a 28x48-inch heavy duty Corliss engine, also an order from F. R. Payne of Williams, Iowa, for a 12x30-inch Corliss engine.

JOHN A. YEATMAN & Co. of San Francisco, Cal., hydraulic engineers and contractors, report shipping last week for the Northern Light M. Co. at Gollivan Bay, Alaska, a complete hydraulic equipment, including an Adams hydraulic lift, pipes, gates, flanges, raffles, ore cars and track.

J. H. ADAMS, San Francisco, Cal., inventor of the Adams hydraulic lift, reports shipping the past week five hydraulic lifts by Schooner Lettitia for Ophir creek, Council City district, near Nome, Alaska; also one for the N. A. T. & T. Co., Nome, and one for the same company to Miller creek, Forty Mile district, Yukon Territory.

THE Webster, Camp & Lane Co. of Akron, O., has consolidated its interests with those of the Welman-Seaver-Morgan Engineering Co. of Cleveland, O., and the two establishments will hereafter be conducted under the name of the Welman-Seaver-Morgan Co. The plans of the new organization, while continuing the manufacture of all lines heretofore carried on by the consolidated companies, embrace the extension of the various departments and the taking over of new and large engineering projects.

THE Gutta Percha Rubber Co. of New York have removed their Pacific coast offices and sales department to larger and more commodious quarters at 26-28 Fremont St., San Francisco, Cal., made necessary by the expansion of their business during the past year. The additional space thus obtained has allowed of a more systematic and convenient arrangement of the stock, which consists of belting, packing, tubing, hose and suction hose, dredger sleeves for pontoons, concentrator

belts, etc. There are fifty tons of belts of all sizes on the main floor, and in the basement are racks for carrying tubing and suction hose up to 12 inches in diameter in 50-foot lengths. A. C. Bates is manager.

OWING to the necessity of obtaining more room, Robert W. Hunt & Co. have moved their New York office to No. 66 Broadway. Messrs. J. J. Cone and J. C. Hallsted of the firm sailed for Europe on the 2nd inst., the former returning abroad after a few weeks visit home. Mr. Hallsted has gone to give personal supervision to the inspection of the structural material for two large London hotels, which has been awarded his firm. These contracts, with several others for buildings to be erected in England and South Africa, as well as the bridge material for this continent, has compelled the firm to organize a foreign structural and bridge department, in addition to the one in charge of rails, splice bars, billets, etc.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING APRIL 28, 1903.

726,302.—MOWERS—T. O. Bailey, Nellie, Cal.
726,493.—CEMENT AND GRAVEL SEPARATOR—J. Behm, S. F.
726,635.—WELL TUBE PERFORATOR—J. J. Brinkman, Bakersfield, Cal.
726,639.—JAR CLOSURE—W. E. Brown, Los Angeles, Cal.
726,402.—BOTTLE—Laura A. Calhoun, Los Angeles, Cal.
726,641.—CLOTHES DRIER—G. Church, Milton, Or.
726,255.—DRILL BIT—Clark & Currier, S. F.
726,634.—ENGINE GOVERNOR—P. V. Cornils, Seattle, Wash.
726,512.—RAILWAY SIGNAL—E. M. Cutting, Oakland, Cal.
726,659.—GATE—A. C. Hunt, Napa, Ariz.
726,657.—ILLUMINATING TILE—P. H. Jackson, S. F.
726,639.—CUSPIDOR CARRIER—J. P. Johnson, Sonoma, Cal.
726,716.—BRUSH—D. F. Maher, Watsonville, Cal.
726,741.—LOCK—J. M. Owen, Ukiah, Cal.
726,834.—BOLTER—R. M. G. Phillips, Los Angeles, Cal.
726,756.—FRUIT GRADER—C. Rayburn, Visalia, Cal.
726,827.—WASHING MACHINE—G. H. Rhodes, Healdsburg, Cal.
726,853.—ROTARY ENGINE—P. C. Sainsevain, San Jose, Cal.
726,700.—GRAVE PROTECTOR—F. Skienke, S. F.
726,867.—RAILWAY GATE SIGNAL—Stevens & Terhorg, Modesto, Cal.
726,781.—KEY RING—N. B. Stone, Outlook, Wash.
726,732.—WIRE—N. B. Stone, Outlook, Wash.
726,807.—SEALING JARS—W. Walter, Shelton, Wash.
726,597.—TICKET PUNCH—H. C. Watson, Oakland, Cal.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CEMENT AND GRAVEL SEPARATOR—No. 726,493. April 28, 1903. J. Behm, San Francisco, Cal. The object of this invention is to separate the gold-bearing cement from the gravel or rock by attrition and at the same time reduce the material to such a degree of fineness that it can at once be put through the usual processes for saving gold which is mixed with sand or tailings. It is adapted to carry on the work on a large scale and in an economical manner. Mr. Behm, the inventor of the above ingenious device, is a practical mill builder and had charge of the foundation, concrete and frame construction of the 100-stamp mill now nearly completed at Hodson, Cal., for the Royal Con. G. M. Co.

RAILWAY SIGNALING DEVICE.—No. 726,512. April 28, 1903. E. M. Cutting, Oakland, Cal. One-half assigned to W. W. Slater, San Francisco, Cal., and H. C. Barnes, Oakland, Cal. This invention relates to improvements in signals for use upon railways and for like purposes and means for operating such signals. It comprises a railway signal consisting of two stationary and differentially colored semidisks having a substantially continuous periphery, a central circular opening, one-half of which is formed in each disk, glasses fixed in each half having a color corresponding in significance with the segment in which it is fixed, and blinds with means by which they are movable in unison to conceal and expose the other glass and a light fixed behind the glasses.

ILLUMINATING TILES.—No. 726,537. April 28, 1903. P. H. Jackson, San Francisco, Cal. This invention relates to illuminating floor, roof or sidewalk tiles, such as are made of glass or transparent material; and it consists in the novel form of such tiles, whereby the light is reflected, refracted and diffused within the space beneath the surface and the light is set. The invention is particularly designed to so direct the light passing through each tile that it will be thrown beyond the lower edge of the tile preceding it in the direction in which the light is to be transmitted.

CUSPIDOR COLLECTOR AND CARRIER.—No. 726,539. April 28, 1903. J. P. Johnson, Sonoma, Cal. This invention relates to a device for carrying cuspidors or vessels of any description where it is desirable to carry a number at once. It consists of a frame of suitably sized material to receive the articles to be carried, a slidable yoke guided and movable with relation to the vertical portion of the frame, and jointed links or equivalent devices which are adapted to fold inward by gravitation, so as to form supports for the articles to be carried. These links are raised into a straight line by lifting the yoke, and when the yoke is released they fold inward, so as to engage the bottom or other part of the device to be carried and hold it in place.

TICKET PUNCH ATTACHMENT.—No. 726,597. April 28, 1903. H. O. Watson, Oakland, Cal. This

invention consists in the combination in a ticket or like punch of fulcrumed handles, a punch-carrying lever pivoted between said handles, a curved single leaf spring having one end fixed to one of the handles and the opposite end contiguous to the rear end of the punch lever, channels made in the adjacent surfaces of the lever and spring, and a ball resting and revolvable in said channels.

Latest Market Reports.

SAN FRANCISCO, May 8, 1903.

METALS.

SILVER.—Per oz., Troy: London, 25d (standard ounce, 925 fine); New York, per silver 54½c, refined (1000 fine): San Francisco, 54½c; Mexican dollars, 42 @ 42½c San Francisco, 41½c New York.

Since last week's quotations, silver has made a further advance of ½ cent per ounce. The mints will require a large amount of silver monthly, and this will not only have the effect of sustaining the present price, but will probably advance it still higher.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50 @ 14.75; Electrolytic, 1 to 3 casks, \$14.50 @ 14.75; Casting, 1 to 3 casks, \$14.50 @ 14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £61 7s 6d spot per ton.

The copper market shows little material change from last week's quotations. An authority says the copper outlook for 1903-4 is good, as the large electric installations demand such a large amount of the metal that the demand and price will be maintained at or near present market figures.

LEAD.—New York, \$4.37½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £12 1s 3d per long ton—2.75c per lb.

SPELTER.—New York, \$5.75; St. Louis, \$4.60; London, £21 15s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 100-lb lots, 10c; 300 to 500 lbs., 11c; 100-lb lots, 13 @ 15c.

TIN.—New York, pig, \$29.90 @ 30.10; San Francisco, ton lots, 31½c; 500 lbs., 32c; 200 lbs., 32½c; less, 33c; bar tin, \$35 @ 37½c. London, £136 spot.

PLATINUM.—San Francisco, crude, \$18.00 @ 19.00; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.50 @ 46.00; large lots: London, £8 15s; San Francisco, local, \$45.00 @ 46.00 of 70½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 31c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17.15c.

NICKEL.—New York, 50 @ 60c @ 7c; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.35; gray forge, \$20.50; San Francisco, bar, 3c @ 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00 @ 22.00; extra sizes higher;

redwood, \$22.00 @ 23.00; lath, 4 feet, \$4.25 @ 4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @ 32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.25; Cut, \$3.35; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. O. H. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1½ 60%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2½ 35%, carload lots, 9½c; less than one ton, 11½c. No. 2½ 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c @ set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2.50 @ 2.75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

OILS.—Linseed, boiled, hbl., 56c; cs., 61c; raw, hbl., 54c; cs., 59c; Lucol oil, hbl., 50c; cs., 55c; raw, hbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 22½c; Astral, 22½c; Star, 22½c; Extra Star, 25½c; Eocene, 24c; Elaine, 27½c; Water White, in bulk, 16c; Mineral Seal, iron hbls., 18½c; wooden hbls., 21c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, hulk, 17c; do., cs., 23½c; 86° Gasoline, hulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, E. W. S., hbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, hbl., 75c; cs., 80c; Sperm, crude, 50 @ 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 50 @ 55c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brynho, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98½-99%, johhing, 25 @ 26c @ lb.; carloads, 23 @ 24c; in tins, 35c; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 24 @ 25c @ lb.; caustic soda, in drums, 3 @ 4c @ lb.; Cal. s. soda, hbls., \$1.25 @ 1.50 @ 100 lbs.; sks., \$1.05; chloride of potash, 12 @ 13c; nitrate of potash, hbls., 10c; caustic potash, 10c in 40-lb tins; horax concentrated, 7 @ 8c @ lb.; roll sulphur, 4 @ 6c; powdered sulphur, 2 @ 3c; flour sulphur, French, 2 @ 3c; alum, \$2.00 @ 2.25; California refined, 2 @ 2½c; sulphide of iron, 9c @ lb.; copper sulphate, 5 @ 7c; chloride of lime, spot, \$2.50 @ 2.75; sulphuric acid, in carboys, 66½ B, 2½c @ lb.; nitric acid, in carboys, 8c @ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, ¾c per lb. above kegs price; in 1 and 5 lb. tin cans, 100 lbs. per case, ¾c per lb. above kegs price. Dry Lead.—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @ 9c per lb.

BONE ASH.—Extra No. 1, 5 @ 6c per lb. No. 1, 4 @ 5c.

BORAX.—Concentrated, 7 @ 9c per lb. powdered, 9 @ 12c; fused, 25 @ 30c.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5 @ 7c.

MANGANESE.—Pure, 7 @ 10c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

BISMUTH.—Sulphate, per lb., \$1.60.

SODIUM.—Metal, 7 @ 10c.

MERCURY.—Bichloride, 7 @ 9c.

PHOSPHORUS.—(American) per lb., 75c.

SILVER.—Chloride, 7 @ 9c @ \$1.00; nitrate, 55c.

URANIUM.—Oxide, 7 @ 10c.

ZINC.—Metallic, chemically pure, 7 @ 10c; dust, 7 @ 10c; sulphate, 7 @ 10c.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

Searchlight District, Nevada.

One of the mining districts of the Great Basin region to attract attention the past few years is Searchlight, in the southeast corner of the State of Nevada. The district is near the Colorado river and also near the California State line. It is in the line of the mineral belt extending northwesterly through western Arizona from Stockton Hill, Mineral Park, Chloride and Gold Roads. This mineral belt is wide and comprises mines of gold, silver, copper, lead and iron. It has already produced millions of dollars in precious metals and is destined to produce many millions more. The Gold Roads camp is near the Colorado river, on the Arizona side. One of the accompanying illustrations is that of the Gold Roads camp

Good Hope Mine, Searchlight, Nevada

in depth. At Gold Roads the veins are fissures filled with quartz and spar, with gold values.

At Searchlight the Quartette, Searchlight, Rambler and Good Hope are among the important properties. The formation in which the veins occur is porphyry. The hills are low and rolling. The local mineral belt is about one-half mile wide. The Quartette Co. built its first mill on the Colorado river, 15 miles distant, and then built a narrow gauge railroad, 17 miles in length, connecting mine and mill. Since that date water has been developed at the mine and a second mill built at the mine.

Three of the accompanying illustrations are of head-frames on the respective mines of the camp. That at the Good Hope is not unusual and its duplicate may be seen almost anywhere, but the frames on the Rambler and Search-

and mine. The Gold Roads mines were discovered but a few years ago and have attracted attention by reason of their extent and value. This section of Arizona, though in a desert, miles from available running water, has nevertheless produced ores of such a grade that each of the several camps has been enabled to establish itself without the aid of outside capital, some of the ores being of shipping grade. The more extensive and deeper development of the mines has resulted in the building of concentrating and other mills in these districts, and the placing of the industry on a more substantial basis. Most of the mines in depth have found water in their lower levels, and this has simplified the economic problem somewhat. Although some of these districts in northwestern Arizona have been known and worked for years, the frequent report of new strikes shows that the full extent and value of the mineral belt has not been fully determined as yet. The veins occur in old crystalline rocks, some of them metamorphic, others igneous, and the variety of ore covers almost everything in the way of sulphides, the principal ores being pyrite, galena,

Gold Roads Mine, Mojave County, Arizona.

zinc blende and chalcopryrite. Ruby silver and native silver are common in the ores of Stockton Hill, Cerbat and Mineral Park. The ores at the surface at Chloride are, as the name indicates, chloride of silver, sulphides coming in

light mines are unique and of a type rarely, if ever, seen elsewhere. The hoisting engine raises the bucket from the shaft, the rope passing over the sheave wheel which runs on an inclined track. When the bucket reaches the sheave the engineer continues to hoist slowly and the bucket is carried up the inclined plane, as shown in the illustrations. The method of dumping is shown in the picture of the Searchlight frame. Beneath the bucket is a short chain or rope with a block of wood attached. The rope slips into a notch cut in a heavy plank secured to the frame. The block beneath prevents the bucket from going beyond the length of short rope. The engineer slacks and the bucket is dumped into the bin as shown, when it is again hoisted and allowed to run back with the sheave to a point over the shaft, from which it descends into the mine. The engineer does all the top work—that is, runs the engine, trams two cars to dump or ore bin, and does the blacksmith work as well. The above described device is doubtless satisfactory, but does not seem to be the most simple that may be devised to accomplish the same result.

It pays (in a variety of ways) to contribute articles of technical merit to the MINING AND SCIENTIFIC PRESS. Some months ago the owners of a big metallurgical establishment wanted a competent manager and wrote this office for the present address of a man who had furnished detailed illustrated account of a similar work in which he had been successfully engaged. Recently a South American mining company secured a manager in a similar way. Beyond and above such cases, which might be numerous cited, it may be said that the best things in this life are not paid for in money, and there is a high appreciation of this in the numberless cases where mining or metallurgical skill is recounted by its possessors in these columns to the common good and real enrichment of their fellow workers everywhere who read. That such things are greatly appreciated and are of permanent value, is exemplified by the fact that it is a daily occurrence in this office to receive personally or by mail inquiry as to the details of some problem in mining, or metallurgy, or engineering, that was described or illustrated herein, with a view to present application to the work in hand.

THE value of the excellent work done by the United States Geological Survey in the Cripple Creek, Colo., district in 1893-94 was fully appreciated by the mining men of that district, and the recent steps taken to secure the necessary funds to bring the work of the Survey up to date, shows this to be so. Since the original survey a vast amount of development has been done, and it has been generally conceded that a re-survey was not only desirable, but would be likely to prove of great value. The survey was about half completed when the funds available for it were exhausted. To meet this shortage those interested have contributed liberally, and the survey will be complete. It is thought that a resurvey will be of great value, as the extensive development of the mines will permit clearer insight into the geology of the district.

Leadville and Its History.

Among the noted mining camps of the world is Leadville, Colo., situated on the west slope of the Mosquito range, at an altitude of over 10,000 feet above the sea. The rush of 1859 to Pike's Peak resulted in bringing into Colorado a horde of hardy and venturesome spirits, who quickly spread through the mountains of the eastern range of the Rocky mountains. Thousands were doomed to disappointment, but many were rewarded by the discovery of gold and other valuable minerals, and yet in that mad rush much that was valuable was overlooked and laid for years neglected. This was to have been expected, of course, for about all that was known of mining in 1859 was the experience gained in the mines of California. Gold was discovered on Tarryall creek, at the head of South Park, in 1859, and early in the spring of 1860 a few prospectors penetrated further and discovered gold on California gulch, a tributary of the Arkansas river, and a town quickly sprang into existence and was known as Oro City. It is said in the height of its prosperity that there were 10,000 people in the town, but this is probably exaggerated. Within a year or two the placers were practically exhausted, producing, it is variously estimated, from \$3,000,000 to \$10,000,000. The placer miners had much difficulty with a heavy gray sand that filled the riffles of their sluices and caused the gold to wash over and run out into the tail race. For a long time the nature of the mineral was unsuspected, but it eventually became known that the troublesome gray sand was lead carbonate. This discovery was made in 1874, but prior to this a search for the source of the placer gold resulted in the discovery and location of the Printer Boy, Twenty-five and some other mines in the porphyry belt. Since then and in recent years many other mines of similar character have been developed and are to-day large producers. Among these are the Ibez and Resurrection groups. The lead-silver ores were really not discovered until 1874, and in 1875 numerous locations were made on Iron hill. In 1876 the first lot of carbonate ore was shipped to a St. Louis, Mo., smelter, but active prospecting did not begin over the district until 1877, when many locations were made. This was nearly twenty years after the original discovery of gold in California gulch. A new town grew up and was called Agassiz. It consisted of log cabins along California gulch on the site of the old town of Oro. The population numbered 200. The only communication with the outside world was by wagons and stages. Three years later, in 1880, the place had grown to 15,000 inhabitants, with a large floating population, and was supplied with all the necessities and many of the luxuries of modern metropolitan cities. Large smelting works were in full blast, and the annual output was about \$15,000,000, which later grew to \$18,000,000.

Later the fall in the price of silver and of lead, the deepening of the mines and resulting heavy volumes of water, and the change from carbonate to sulphide ores of complex type, resulted in reducing the output materially, but Leadville has always been a progressive camp, and the economies introduced and practiced there have been followed all over the world. The metallurgists of Leadville introduced many innovations in smelting, overthrowing old, time-honored ideas, and proving that old methods were not always the best methods: that the high percentage of lead employed in smelting was not essential to success. The furnaces were changed in shape and size, until the old-fashioned stacks looked like experimental plants by the side of the giant cupolas built for the reduction of Leadville's ores. The successful development of Leadville's mineral resources did much to give to Colorado the prestige that State enjoys as a mineral region. There are mines all over the State, but Leadville showed what was possible in a rugged, mountainous region two miles above the sea. The energy of her miners defied and surmounted all obstacles, and set the pace for the world.

The history of Leadville district, extending over a period of forty-three years, is peculiar, and illustrates in the most interesting manner the growth of knowledge of mining and metallurgical practice, and its evolution from methods sufficient in their day, but now obsolete and looked upon as crude and out of date, is instructive as well as interesting. Indeed,

the methods of 1859 could not endure in this age of active competition. A large part of the values of Leadville's production is in base metals—lead, zinc and copper, with gold and silver in much less amount.

Should the gold of California gulch be first discovered to day, within two years Leadville would have gone through much of her entire past history. The carbonate ores would have been discovered within a few days and railroads, smelters and all that now goes to make up its modern equipment would have been accomplished. Cripple Creek, a comparatively modern discovery, is evidence of this. The discovery of any new district possessing such vast latent mineral resources as the districts of Leadville and Cripple Creek will, with the aid which present knowledge gives, quickly reach the zenith of its prosperity.

The monthly output of Leadville is about 75,000 tons of ore, and that this can be maintained for a long period seems probable. Its future depends almost wholly upon the development and treatment of its large bodies of low-grade sulphide ores, of which there is stated to be many millions of tons available. The zinc in the sulphide zone has had a retarding effect on the industry until lately, but the introduction of the electro-magnetic separator means much for this district, as by its use two clean products are now possible, the zinc ores on one side and the lead-iron ores on the other, both products containing gold and silver.

The principal drawback to the greater development of Leadville's resources is water in the deep mines, and the unfortunate phase of that is that unless concerted effort is constantly made to handle the water problem further extensive development must be comparatively slow. Still, the mines have thus far shown their ability to handle the water encountered, and the decreasing cost of power which may be anticipated will be a factor of no small importance in the economy of Leadville's further development.

Make Haste Slowly.

Mining companies are organized for profit, which is a legitimate and a much-to-be-desired result of mining operations, but haste to pay dividends is sometimes retro-active, and works more harm than good. When a mine is acquired, by purchase or otherwise, if it is not already equipped it must be provided with the necessary machinery, buildings, etc. Then, if the mine is in sufficiently advanced condition to afford a continuous supply of payable ore, dividends may be considered, but the unfortunate experience of many companies which have prematurely declared dividends—that is, disbursed the first available profits in dividends, making no provision for a possible change in existing conditions—has shown the wisdom of withholding a sum sufficient to rebuild the surface plant or to tide over any temporary and unforeseen interruption in the progress of mining and reduction of the ores. The wisest companies create a sinking fund, employing a stated percentage of profits, or setting aside a monthly sum for the purpose. Deterioration is one of the things that must be given consideration, and possible extension or change in the character of the plant are even more important considerations. Stockholders are always willing to accept dividends, and in the majority of instances it is their wish that dividends be forthcoming soon and often, but there are few stockholders who cheerfully submit to an assessment even when they realize that the money is to be used in extending the plant to the ultimate advantage of the stockholders themselves. Many a competent superintendent is embarrassed and handicapped by the demands of the directors and stockholders of his company for dividends. In one instance, an important and absolutely necessary improvement—the sinking of a new shaft—was delayed and the project was finally abandoned after having been started for the reason that the company demanded that certain profits be distributed in dividends, and later when the mine ceased paying because of the great expense of operating through the crooked old shafts, the stockholders refused or were unable to "put up" the money necessary to sink the new shaft, and the mine was closed down and remains closed, but this is only one instance of many of the same kind.

CONCENTRATES.

NORMAL CYANIC ACID is unknown in the free state, but there are ethers of it, as, for example, methyl cyanate.

DACITE is a quartz-andesite, with the quartz occurring either in sharply outlined crystals, or more or less rounded or corroded, with inlets of the ground mass.

THERE is no local market for large quantities of mica on the Pacific coast. Buyers of mica are A. Schoonmacker, E. Munsell and Union Mica Co. of New York City.

WHEN ter-chloride of gold is immersed in caustic ammonia it forms a compound which explodes when struck. It is a dangerous and extremely unstable substance.

THE steel wires in flat cables usually will outlast several "sewings" of the soft iron wire used in their construction, the latter wearing much more rapidly than the vertical wires.

RETORTING quicksilver will extract the grease. It were better to retort the last tenth of the fouled quicksilver separately from the first nine-tenths. The heavy portion, or residuum, will be with the last tenth.

IN the "nail assay" of sulphides, a convenient way of introducing the iron is in the form of cut tacks—8 to 12 of No. 8's, according to the character of the sulphides—scattered on top of the charge in the crucible after mixing.

WITH increasing altitude the boiling point of water becomes lower, until at great altitude the hand may be immersed in boiling water without injury or discomfort. Altitude is often estimated by use of "boiling point" thermometers.

HEAVY stamps should be provided with proportionally heavy mortars, and require more power than light ones. The heavy stamps will crush relatively more rock than light ones, but the limit in weight to which gravity stamps have been carried is about 1200 pounds, when newly shod.

ANTIMONY is found in the native state in several localities in California. It occurs in a number of minerals, the most common being stibnite, Sb_2S_3 , which is the principal source of the antimony of commerce. It is a brittle mineral, and pulverizes easily. It melts at 425°F . and vaporizes at a red heat.

It has been stated that the appearance of native mercury in quicksilver mines may usually be considered an indication that the bottom of the ore shoot or deposit is being reached. That this is absolutely a fact has not been fully demonstrated, though indications point to the probability of the statement being true.

SO FAR as "Concentrates" knows there is no one at present treating antimony ore on the Pacific coast. The fact that the antimony ore specified carries good value in gold would not make it a valuable smelting proposition, as in the extraction process much of the gold is not ordinarily susceptible of being saved.

ALL stamp batteries should be so arranged as to be operated singly, that is, independent of adjoining batteries. This may be accomplished by providing separate cam shaft and pulley for each mortar with its complement of stamps, or by a series of clutches on the several pulleys leading from the mill line shaft to the cam shafts.

AS these "Concentrates" are answers to questions, the questions themselves being omitted, and the reply boiled down in briefest space, it is desired that such inquiries be stated as clearly and accurately as possible, so that the reply may be of value not only to the inquirer, but to many other readers who may wish the same precise information.

ANGLESITE is sulphate of lead. It is not an abundant mineral, but occurs with other lead minerals as a secondary product of the alteration of galena. Masses of anglesite, when not pure, often show the remains of the cubic structure of the original crystals of galena and sometimes, at the nucleus, solid crystals of unaltered galena may be seen.

A CERTAIN type of vein is observed sometimes in granite which at the surface is well defined and often rich in gold, but which pinches out in shallow depth. These are often called "gash" veins. That such veins do not open out below with improved values is not demonstrated in most cases, as with the first pinch all exploration in depth is usually stopped.

METHANE is the simplest compound of carbon and hydrogen known, and is, next to hydrogen, the lightest gas known. It is formed in marshes, whence the name "marsh gas"—by the slow decomposition of organic matter under water. Bubbles of this gas will rise to the surface of the water, if the mud beneath be stirred with

a stick or otherwise, and will ignite. It is the "fire damp" of the mines and is also contained in the mixture of gases flowing from gas wells. It is colorless and odorless and but slightly soluble in water.

ROPE TRANSMISSION may be made effective for considerable distances. At the Silver King Co., Ltd., in Calico district, Cal., a pump was run by rope transmission half a mile distant from the engine. By the employment of properly adjusted sheaves, power may be transmitted around obstructions, such as buildings, mountain spurs, etc., which chance to be in the direct alignment of the plant.

THE present mining law of the United States requires that the end lines of a mining location shall be parallel, but it does not admit of their being other than continuously straight lines extending from the line on one side of the claim to that on the other. It is not necessary that the end lines should be at right angles to the side lines. Any variation from those conditions will result in the loss of the extralateral right.

GLASS is made of silica in connection with no less than two metallic oxides, generally potassium or sodium and calcium or lead oxides. By the kind of metallic oxides employed in its manufacture the glass is known as lead glass, lime glass, soda glass, etc. Various other minerals are used to give the glass the desired color. Manganese oxide gives an amethystine or purple color, iron gives shades of green or brown, arsenic produces white glass, etc.

THE collection of minerals belonging to the Field Museum, Chicago, numbers 125,000 specimens; many of these were gifts from World's Fair exhibits. The original collection was gotten together by Professor Ward, and during the Fair was exhibited in the gallery of the Mines Building. It is said that Prof. Ward received \$100,000 for the collection. The Museum receives gifts of specimens, it having many friends. Dr. O'Farrington is in charge.

IN buying running ropes it should be remembered that wear of ropes increases with speed, and where greater capacity is demanded it is advisable to increase the load rather than the speed. Hoisting ropes should not have a factor for safety of less than seven. That is, the strain which it should be called upon to withstand should at no time, even when old and worn, exceed one-seventh of its ultimate strength. Particularly is this applicable to ropes employed in hoisting men.

WHEN tellurium occurs in gold ores it usually complicates their treatment. If in small quantities with sulphurets the tellurides may be considered as a part of the sulphides, and require no particular care in the way of separate treatment, but if the greater part of the value be in the telluride the best method is to closely sort the richest ores and concentrate the low-grade ores with great care, preferably by double concentration. This results in giving a high-grade product which may be shipped to smelters.

AMALGAM obtained from batteries and mill plates, when cleaned and tightly squeezed, will usually retort about one-third of its weight in gold. This varies greatly, however, with the state of division of the gold. When the gold in the rock is very fine the amalgam retorts as low as 20%, or even less. The quantity of water that may be employed in milling gold ore varies within a considerable range. It is usually between 800 and 1000 gallons per ton. It is usually advisable to employ as little water as possible and do good work.

THE greatest mineral collection in the United States is that owned by the City of New York, and installed in the American Museum of Natural History of New York City. This collection has within the past year been entirely renovated and a new wing to the Museum given over to its use. The collection contains upwards of 300,000 specimens. The mounting and display is an admirable piece of work. The City of New York appropriates many thousands of dollars each year for the purchase of new specimens in the furtherance of the collection.

GYPSUM, the sulphate of calcium, which occurs native in extensive beds in many parts of the world, is used in many arts, manufactures and otherwise. It is manufactured into plaster of Paris; is used native as land plaster. It is also a good non-conductor of heat—useful in safe manufacture, and in lagging boilers, steam pipes, etc. Calcium sulphate forms often in the precipitating vats of chlorination works, as the result of adding iron sulphate to the gold solution for the purpose of precipitating the gold, the sulphur present uniting with the lime to form the calcium sulphate, which is found crystallized around the sides of the vats in a thick ring of white acicular crystals.

THE practice of leaving a pillar of ore around a shaft where the shaft is sunk in an ore body, is the outcome of disaster where this provision has not been given consideration. The size of the pillar should be determined by the extent of the ore body. If it be merely a vein, not exceeding the width of the shaft, a block of ore 10 or 15 feet on either side is sufficient, but if the ore body be large it may be necessary to have the shaft surrounded by a pillar 100 feet square, or even larger. The larger the ore body and the more extensive the excavations,

the larger should be the pillar. In view of this fact the advisability of sinking shafts in the country rock is made apparent. Due attention to this will often save much expense and trouble later when the stopes become large. If contemporaneous filling be practical, a smaller block of ore about the shaft is permissible than where timber only is used to support the excavations of the mine.

ROCKS are mineral aggregates, and may be simple, when formed of a single mineral, as calcite, or composite as diorite, made up of several minerals, as hornblende and plagioclase. The names of rocks should suggest their composition and usually do, as quartz-mica diorite, indicating that the rock is composed of hornblende and plagioclase, with mica and quartz as accessories. Granite is composed of quartz, potash feldspar and mica, as essential constituents, but it also usually contains numerous other accessory and unnecessary minerals. Accessory minerals are usually of local occurrence, and the fact that they are found in rock of a certain locality does not indicate that the same minerals will be found in the same rock mass at a short distance away.

DIABASE is a rock often found associated with gold-bearing veins. It is of common occurrence in California, and has been found in the Comstock region at Virginia City, Nev., and elsewhere. It is not always easy to distinguish diabase from other greenstones, however, without analysis or examination of a thin section by means of the petrographical microscope. It is coarse to fine grained and is usually a compact compound of (plagioclase) lime-soda feldspar, augite, and generally viridite (a green substance not easily resolvable into a definite mineral, but probably the result of alteration of augite), specks of iron ore (magnetite) and, as accessory, biotite mica, rhombic pyroxene and olivine, occasionally quartz. Two of the rock specimens from Tinton, South Dakota, are diabase, one fine grained, the other coarse, the latter with olivine. The third specimen of dark-gray rock with white specks is either syenite or diorite, the feldspars being too curious to determine their original character.

HYPOSULPHITE OF SODA is used in leaching chloride silver ores, or those which have been chloridized. The silver is then precipitated by the use of a solution of sodium sulphides. Ores containing chloride of silver may be tested for the presence of silver by this process on a small scale in a test tube in the following manner: Pulverize the ore, place in the test tube sufficient of the pulp to fill about one-third of the tube, then pour on a solution of sodium hyposulphite and shake vigorously. Allow to stand until clear, and then add a few drops of calcium sulphide, made by boiling lime in sulphuric acid. If silver be present it will be precipitated as a sulphide in black feathery flakes. Manganese, lead and copper all are soluble to some extent in the hyposulphite solution, and these, if present, are also precipitated by the calcium sulphide, but each has a characteristic appearance and can be determined by the expert in this method of prospecting for silver in ores.

IN geology a "fold" is a term employed to denote a bending of the strata. There are several kinds of folds. The anticlinal fold is one where the strata are uplifted in dome shape or in a long, ridge-like form, the rock sloping away from the crest toward the sides. A synclinal fold is that where a basin or trough-like depression is formed by the bending of the strata. A monocline is one where the strata is flexed upward from a horizontal or approximately horizontal position, and then assumes a flat position again beyond. Some broad anticlines are flat-topped, thus forming practically two monoclines, one on either side. An overturned fold is one in which the rocks have been so folded that the crest of the fold has been bent over, resting upon some portion of the fold beneath. Folding is due to lateral pressure. When this pressure is so excessive as to fracture the rocks a fault results. Faults seem to be as often the result of contraction as of compression. A normal fault is one in which the hanging wall rocks have slipped downward relatively to the foot wall side.

THE lead minerals are the most varied and beautiful of all mineral species. There are upward of a hundred now known; about every known color can be observed in these. There are but few lead minerals of commercial value, but from a specimen standpoint the beautiful lead minerals are held in high esteem and great value. Those most eagerly sought are native lead, cerussite, anglesite, clausthalite, jamesonite, boulangerite, mendipite, leadhillite, lanarkite, caladonite, crocoite, etolizite, wulfenite, pyromorphite, mimetite, endlitche, vanadinite, desclozite, nadorite, phosgenite and matlockite. The United States produces the finest specimens of wulfenites, endlitche, vanadinites and desclozites, as well as pyromorphite. Arizona, New Mexico and Pennsylvania produce by far the best of these minerals, the Pennsylvania pyromorphite being in several colors—green, brown and yellow—beautifully crystallized. England produces such rare species as matlockite, mendipite, lanarkite, caladonite, mimetites and phosgenites. Germany turns out some lovely pyromorphites, jamesonites and boulangerites, while Siberia and Africa are the only known producers of crocoite, the most beautiful ore of lead. Australia produces by far the finest specimens of the lead carbonates, cerussite and anglesite. A mendipite specimen crystallized costs up to several hundred dollars. This also applies to specimens of crocoite, caladonite and lanarkite.

Mineral Resources of Southeastern Alaska.

Written for the MINING AND SCIENTIFIC PRESS by
WM. M. BREWER.

During the past winter the writer spent several weeks in the Ketchikan mining district in southeastern Alaska, and while, of course, one cannot learn as much about the geology and prospective mineral resources during the winter months as he can during the summer, yet the writer is of the opinion that he gathered sufficient interesting information relative to the mineral resources of the district to warrant the present article.

The past mining history of southeastern Alaska dates back to the discovery and early development of the Treadwell mine on Douglas island about 1880, but no attention was paid to other than free-milling gold ores in the neighborhood of the Treadwell mine until after the Klondike excitement commenced in 1897. Then it was that rumors relative to the immense mineral deposits on Prince of Wales island first commenced to receive attention, and during 1899 and 1900 the reports of discoveries made created a stampede to the town of Ketchikan, which is the distributing center for the district embracing the mainland coast and islands north of the international boundary, and lying between that and the mouth of the Stikine river.

The extent of the territory comprising this district is enormous, especially when considered from the standpoint of the length of the coast line. One can hardly realize unless they actually travel along the coast of the mainland and islands in a small boat how great the length of coast line is. This has been caused by the numerous bays, inlets, coves and canals, the deep channels of which have been cut partly through erosion due to glaciation, and partly because of the volcanic action which has thrown up mountains and caused depression which to-day form the many bays and inlets.

If the prospector or mining engineer visiting this district has not already familiarized himself with the geology and mineral resources of the mainland and islands along the coast of British Columbia, he will be at a loss to determine the whys and wherefores of many interesting features to which his attention will be drawn. But a few seasons devoted to working in the province south of the boundary line will have enabled him to determine many material facts relative to the geological structure and occurrence of the ore bodies which otherwise might seriously puzzle him.

The similarity of much of the geology, and especially that which has influenced the formation of the ore bodies which exists between this northerly district and Vancouver island, is most striking. In the southerly district one finds immense ore bodies usually composed of magnetite, with impregnations of chalcopyrite, sometimes as large masses and at other times as crystals disseminated through the magnetite with variable degrees of regularity. These ore bodies usually occur either at the contact of limestone and basic igneous rocks, or else fill fissures in the latter rocks which have apparently been caused by contraction during cooling process. In the northerly district the writer found practically the same condition and were it possible to follow the line of strike of the country rock from Vancouver island to Prince of Wales island, it suggests itself to the writer that it is possible a mineral zone would be discovered maintaining in a fair degree, continuity the entire distance; but as such a course is impossible, the features possessing similarity can be merely referred to as suggestions from which precedents can be taken and comparisons made by the workers in both districts.

In addition to these occurrences of bodies of magnetite and chalcopyrite, one will find that bodies of bornite occur in both districts at the contact of limestone and igneous rock, and that closely associated with the ore bodies in both districts are epidote, garnet, hornblende, pyrrhotite and white iron.

These two characters of ore bodies occur, so far as the writer's observations have gone, in parallel zones, which zones are usually separated from each other by variable widths of country rock which in many places, where it has been examined by the writer, is not mineral bearing. As an illustration of this characteristic one finds in the eastern portion of Prince of Wales island, especially on Kassan peninsula, immense outcroppings of magnetite with chalcopyrite impregnations occurring in igneous country rock, designated by Mr. Brooks of the U. S. Geological Survey as greenstone; while on the western portion of the island, around Copper mountain, are found occurrences of copper carbonates and bornite as contact deposits between limestone and igneous rocks. The same conditions can be found on Vancouver island on the western side, where, in the mountain range which extends parallel to the coast line and crosses many of the rivers which empty into the heads of some of the longest inlets, large deposits of magnetite carrying chalcopyrite, occur; and in a parallel zone, a few miles to the westward, contact

deposits of bornite between limestone and igneous rocks have been discovered.

Another similarity with regard to the mineral resources of these two districts is the fact that, in both, veins of gold-bearing quartz occur, usually in schistose rocks in the near neighborhood to intrusive dikes of granite.

The development in the Ketchikan district has been, up to the present time, too limited in extent to warrant the expression of any decided opinion as to the prospective value of most of the discoveries so far made.

By far the most numerous discoveries so far located belong to the class of magnetite deposits carrying chalcopyrite, with marcasite, epidote and garnet closely associated.

The localities where the most extensive prospecting and development work have been done are as follows: On Prince of Wales island, on the Kassan peninsula, on the eastern side of the island; near Karta and Hollis bays at the head of Kassan inlet, at Port Johnson, also on the eastern side of the island, but a considerable distance south of the Kassan peninsula; Niblack Anchorage, also on the east side of Prince of Wales island; on Copper mountain, on the western side of the island; at Thorn Arm, on the western side of Revillagigedo island; also about 1½ mile from Ketchikan, on the Revillagigedo island.

The occurrences of mineral on Kassan peninsula on which the most extensive development work has been done are magnetite, or pyrrhotite, carrying variable values in gold, silver and copper. These values sometimes run as high as 15% or 16% copper, \$2 or \$3 in gold and two or three ounces in silver, but if an average of the entire ore bodies is taken, then these values run very much lower. Indeed, this class of ore bodies must be characterized as large bodies of low-grade ore. Sometimes they are found to reach a width of 50 or 60 feet, and to occur in lenses of 200 or 300 feet in length. While there is a mineralized zone apparently extending along Kassan peninsula from southeast to northwest, and among the local prospectors the term "leads" is often used to describe these occurrences of ore, this term is really a misnomer, because the structure of all the ore bodies so far discovered along this zone is lenticular, and the mineralization, so far as gold, silver and copper values are concerned, is very bumpy. The most extensive development work performed on the peninsula is on the following locations: The Mount Andrew, Mamie, Copper Queen, Poorman and Copper King.

It is a serious question as to what proportion of the ore so far discovered will pay to ship, and equally as serious a question as to whether the prospects have sufficient prospective value, notwithstanding the apparent extent of the ore bodies to warrant the erection of a local smelter when the cost of coke is considered. All fuel for such a plant would have to be brought in from Vancouver island or the State of Washington, unless the coal beds reported as occurring on Queen Charlotte island are developed and proved to contain coking fuel.

To the westward from this zone carrying copper ores there occurs a zone carrying gold-bearing quartz. This is represented by the discoveries made near the shore of Hollis bay and in the vicinity of Port Johnson. The former locality has been considerably prospected, but most of the work done has been concentrated on two groups, the Cracker Jack and Golden Fleece. The most important discovery made in the latter locality is the Valparaiso. From all of these locations sample shipments of limited quantities of high-grade gold-bearing quartz have been made to coast smelters.

Near Karta bay, at the extreme head of Kassan inlet, copper ore has been discovered and prospected to a considerable extent. Judging from the samples brought from that locality the ore would appear to be of a much better average grade than the copper ore on Kassan peninsula, but while the discoveries on the peninsula are convenient to deep water, those near Karta bay are much further removed.

On the western side of Prince of Wales island work of development has been confined principally to Copper mountain and vicinity. The predominating character of the ore is copper carbonates and bornite, but gold-bearing quartz had also been found on this same side of the island, carrying high values.

On Revillagigedo island, near the head of Thorn Arm, and also in the vicinity of Ketchikan, gold-bearing quartz has been discovered occurring in a chloritic schist, and at the Sea Level mine on Thorn Arm a 30-stamp mill was in operation during the winter. This belt of schistose rock is apparently very persistent along its line of strike, which is from southeasterly to northwesterly, but, judging from the conversation of the oldest prospectors, has received but comparatively little attention except in the vicinities noted.

The future of the Ketchikan mining district depends entirely on the grades of the ores discovered, metallurgical methods necessary to reduce these ores, cost for treatment of the same, and last, but not least, the influx of capital from the outside.

THE use of metal tamping bars in mines is extremely dangerous and should be prohibited by superintendents. Colorado has a State law making it a misdemeanor to employ a metal bar of any kind in tamping holes.

Cyaniding Tailings in Sierra Co., Cal.

Written for the MINING AND SCIENTIFIC PRESS by H. R. CASE.

During the summer of 1902 I leased the cyanide plant at the tailings deposit of the Young America quartz mine, near Sierra City, Sierra county, Cal. The plant built in 1896 was operated about five months and closed down for lack of water power, remaining idle until last season. The property is at such an altitude that the season is very short, and, being 50 miles from a railway, can only be operated to advantage during the summer months. The tailings from the 40-stamp mill, since destroyed by fire, were conducted ½ mile by flume and deposited in a small deep pond at the foot of Sardine lake. The leaching plant is on the side hill opposite the tailings deposit and consists of a 200-ton sand-storage tank of 2x12 inch plank; four twelve-ton steel solution tanks; four redwood leaching tanks, 25 feet in diameter, and of eighty-five tons capacity, fitted with one side discharge gate and filter bottoms of 1x2-inch slats, covered with cocoa matting and ten-ounce duck; two sixteen-ton gold tanks of white pine and four ten-ton steel sump tanks.

It was necessary to rebuild the leaching tanks, for, when first erected, each stave was toenailed to the tank bottom, so that it was quite impossible to draw the staves together with the hoops. It was a queer example of how not to build circular tanks. When rebuilt the tanks were quite tight, but now and then a leak would break out of some old nailhole which made constant care necessary.

The power for solution pump, sand pump and vacuum was derived from a limited water supply, 250 feet up the hill from the mill, brought from an abandoned tunnel after the snow disappeared, 2 miles back in the mountains and delivered to the mill through 12 and 8-inch pipe from the penstock.

The water in the pond was pumped by a 6-inch centrifugal pump operated by a 5x5½-inch Westinghouse steam engine. Six hours pumping each day kept the water down so as to provide a 6 to 8-foot bank of sand which was washed down by a jet from a ¾ inch garden hose to the intake of the suction line of 4 inch threaded pipe connecting with a 4-inch hydraulic elevator using 1 inch nozzle. Two of these elevators were in use, one lifting the sand about 24 feet to an intermediate tank divided by partitions, so that the sharp leachable sand fed automatically to a second elevator, while the slimes, which only assayed 60 to 75 cents, passed off with the surplus water. The second elevator delivered the sand to the 200 ton storage tank, from which it was sluiced when wanted to the leaching tanks, one man emptying and filling a tank in six to eight hours. The 4-inch sand pumps, working twenty-two hours a day, just about furnished the sand required for six tanks each week. As soon as the tanks drained so the sand could be hauled off, thirty tons of two to two and one-half pounds cyanide solution were run in, each ton containing one pound of fresh cyanide, after which only sump solution, titrating one and one-half pounds down to sevenths pound cyanide per ton was used.

After running on twenty tons of strong solution the gold made its first appearance, the effluent assaying 15 to 20 cents per ton. From this the values increased rapidly up to \$1.50 to \$2.50 per ton, depending on the quality of sand being treated. After receiving sixty to seventy tons the solutions gradually decreased in value until 120 to 140 tons had been applied, at which time they assayed 20 to 30 cents. Twenty tons of wash water were then added and the tank sluiced out. The time of treatment, including filling, was four and five days, so that with the four leaching tanks we filled six tanks each week.

Precipitation was effected in forty-eight sheet-iron boxes, each holding ¾ cubic foot of zinc shavings, placed in series of six. Very little gold passed the third box, and the solution after zinc seldom assayed over 5 cents per ton. As the sump solution tanks were of ten tons capacity all solutions were run in ten-ton lots and a drip sample representing the work of each shift before and after zinc, saved from each ten-ton lot, was assayed every morning; this indicating very closely the previous day's saving on the zinc and the condition of the solution regarding precipitation. I also assayed a sample of the solution coming from each tank at 7 A. M. and a sample of the sand before and after treatment for each tank. By this work conditions never went very far wrong and I knew just what we were doing each day, the final figures for the season proving the general accuracy of the daily work, for the solution and sand assays, and the bullion receipts checked within a fraction of 1%. We cleaned up every two weeks, treating the slimes at the mill and shipping the bullion, 900 fine in gold and silver, to Selby Smelting & Lead Co., San Francisco, Cal.

The average assay of the sand for the season was \$1.50, though during the month of September the average was only \$1.13. The net extraction for the season, 76.3%, could have been increased somewhat by longer treatment, but considering the short season, the grade of tailings and the capacity of the plant the time employed yielded a larger net profit

than a longer treatment and greater extraction could possibly have done.

The costs per ton for the season's run of 9700 tons are as follows, wages paid laborers averaging \$50 per month and board:

Cyanide costing 25¢ per pound, delivered.....	\$13.72
Caustic soda.....	60
Zinc shavings, at 16¢ per pound, delivered.....	4.70
Labor, wages.....	20.70
Labor, board.....	6.83
Water for power.....	1.03
Oil and waste.....	40
Assay supplies.....	2.00
Charcoal.....	1.50
Sulphuric acid.....	90
Express and smelter charge.....	1.04
Repairs.....	1.44
General expense.....	1.05
Total.....	\$55.91

Separation of Gold From Copper.*

Written by F. R. CARPENTER, M.A., Ph.D.

The metallurgical product obtained in pyritic smelting is ordinarily a low-grade copper matte. In the revival of this ancient process of smelting the old methods of refining and separating the gold and silver from the matte have received but little attention, owing to the fact that it could be readily sold to the lead smelters. As long as competition existed between them this left nothing to be desired, and even now, when every matte smelter is, in a small way, a competitor of the American Smelting & Refining Co., commonly called the "trust," very good terms can be made; but as the trust is not an eleemosynary institution, it does not do this refining as an act of charity. Besides, one is always haunted by the fear that they may some time refuse to do it at all.

In the old days of European practice refining the matte was always done at the works where it was made. It was usually accomplished by a process known as lead soaking, and if the matte carried copper this was supplemented by lixivation. Both processes were truly ancient, but when combined, as at Kongsherg, Norway, they were very effective, and held their own until displaced very recently by electrolysis. I wish to remark that the matte obtained in pyritic smelting differs in no way from that obtained in the reverberatory process, except, perhaps, in the per cent of copper, and not always in this, as at Zalathna and at Deadwood. It is also worthy of remark that when pyritic smelting was generally employed at Freiberg, some three hundred years ago, the reverberatory furnace was generally preferred to the blast furnace as in every way more economical, but at Mansfield, Saxony, which process I modified for use at Deadwood, the blast furnace has always been preferred. In Wales, in Butte, Mont., and in other places, the reverberatory still holds its own, but the product is everywhere the same, viz., a matte with varying percentages of copper, gold and silver.

In the present state of metallurgical knowledge the best way of treating this matte would be to concentrate it to black copper and employ electrolytic methods. But pyritic smelters are not usually of sufficient magnitude to justify an electrolytic plant, and the difficulties in the way of sampling and selling the black copper are very great.

In connection with my son—Arthur Howe-Carpenter—I have made many experiments, often at considerable cost, trying to devise some method whereby the matte might be refined at the plant where it is made, some account of which may be of interest to the society.

At Mansfield amalgamation of the matte gave way to the Augustin process, and this in turn to the Zier-vogel method—a beautiful process, but one requiring much skill, and not providing for the extraction of gold—a matter of no import at Mansfield, as the ores are exclusively silver-copper. When the process was introduced into America it became necessary to supplement it with some means of saving the gold, but how this was accomplished, beyond the fact that the gold is first concentrated into copper bottoms, we are not informed.

I began my work at this point. I do not know the name of the genius who first refined copper by means of the copper bottom process, but it is ancient, and was long employed in Wales in the process for making "best selected copper." It was, also, very early known that these bottoms carried down, with the other impurities of the matte, practically the whole of the gold, and a process for treating the gold contained in these bottoms was well known and employed for its recovery as early as 1780. In the copper bottom process it will be remembered that the matte is enriched by washing and resmelting until it carries about 60% to 65% of copper. This enriched matte is subjected to a roasting whereby a reaction takes place between the oxide and the sulphide, and a certain per cent of metallic copper is set free, carrying down with it many of the impurities existing in the matte, and among them almost all of the gold. This selecting process has been most fully examined and set forth by Allan Gibb, to whose work reference

may be had for details. Now, when one remembers how the first bottom is obtained, which should equal 14.2% only of the copper of the original matte, all he needs to do is to cast this copper hack into matte, and repeat this selecting process upon a smaller scale, or until a bottom of sufficient size is obtained to be refined by any of the ordinary methods. This is the process described by Jars in 1780, and which was employed—but doubtless with some modifications—by certain Welsh smelters until comparatively recent times.

We first sought to modify this process, and later to apply it to the winning of the silver also. My first idea was to take these bottoms and cupel them directly with lead. This worked very satisfactorily, but gave a by-product to be refined. We next tried cupelling the copper direct, as though it were ordinary lead bullion instead of copper. At first this goes on very slowly, but when the bath becomes saturated with cuprous oxide it goes on very rapidly. It differs in no way in principle from the cupellation of lead. We next tried the scorification of copper with silica, and, lastly, we roasted the copper, which, if in thin sheets or if granulated, may be done somewhat slowly, depending, of course, upon the thinness of the sheets or granulations, and this we smelted with silica until the quantity of metallic copper was sufficiently reduced for refining the gold. This gave the best results of all. None of them provided for the recovery of the silver, which did not remain with the gold, but was lost in the residues. In the class of work in which I have been engaged a large percentage of copper in the charge is not desirable. The cleanest slags made in Deadwood were made in reverberatory furnaces, and the matte carried only from 3% to 5% copper. I, of course, made a very large percentage of matte of very low gold and silver contents. This matte was added direct to the blast furnaces and there concentrated. But even in blast furnace work it is desirable, where gold and silver production is the primary object of smelting, that the matte shall not exceed 10% in copper. Now, one may roast this matte and smelt it with siliceous ores until it reaches any desired degree of concentration. We may bring it to the point employed in the copper bottom process, but while 15% of reduced copper will free the regulus from gold, the whole of the silver can not be so recovered, no matter what per cent of copper is so reduced. I may remark that silver reaches its maximum concentration in bottoms, according to Allan Gibb, when 19% of copper is so separated, but as 42.5% of the silver may be so recovered, the remaining 81% of the regulus may be sold to the copper refiners, as the difficulty of sampling is greatly lessened by this treatment, and we have recovered the bulk of our values in the 19% bottoms, which we may treat ourselves.

Instead of stopping at the point required by the copper bottom process, we may concentrate the whole of the matte to black copper, which will carry all the gold and silver of the original matte, save that which has been lost in the slags while concentrating it. These rich slags are added, of course, to the ore charge and their values thus recovered. If we now proceed to treat this black copper exactly as we treated the copper bottoms we shall indeed recover the gold, but the silver will mainly go into the residues, as before, but they now carry the whole of the silver, with little or no gold, and are either silicate of copper or copper oxide. In either case the reduction of a small percentage of metallic copper, unlike the bottoms in the Jars process, will carry down the silver. I am not aware that this has heretofore been published. It is, also, fair to state that this has not been done on a working scale, but laboratory tests promise success.

If the copper bottom process is employed, it may be done as follows, although other methods are known: Say ten tons of 65% matte is placed upon the hearth of a small reverberatory furnace. The doors are left open and the charge fired for six to eight hours, or until a semi-pasty stage is reached. The doors are then closed and the charge melted down. The reaction between the oxide and sulphide, as in the "direct process," sets free a certain percentage of copper, which Allan Gibb determined to be 14.2% for best results. The whole charge is now tapped into moulds, and beneath the slag blocks nearest the furnaces will be found sheets of impure copper—or copper "bottoms"—whence the name. We have now concentrated the bulk of the gold into a ton and a half of material for further treatment, which may be returned to the same furnace, roasted in all respects as the original ten tons, again smelted down, the copper oxide slagged off and the copper tapped into sheets or granulated for further treatment upon a copper test or other furnace, where it is again roasted and slagged with silica until sufficiently reduced in quantity to refine the gold with litharge, niter or other flux.

STRIKES continue to disturb industrial conditions throughout the United States. At present the seat of these troubles is principally in the East, the Western mines, for most part, being in operation, strikes either having been settled or averted temporarily. Some of the strikes are in "sympathy," but it is safe to say that the "sympathetic strikes" in few instances have the sympathy of the public, and this is an important factor in a strike.

The Making of an Oil Well Bit.

An oil well hit, in the first place, is not a cutting tool but a hattering tool, or hattering and pulverizing tool, although it is necessary to have, to a certain extent, a cutting edge on the hit. This cutting edge is built with a very short bevel on the center of the hit, the outside being kept fairly sharp and acting as a rimmer to keep the hole to certain dimensions, says a writer in Sparks From the Anvil.

The most important part in the beginning to make an oil well hit, is to have the right kind of steel of the right carbon—combined with other good qualities known to the steel maker—so that the hit when in service will not hatter, yet will be so tough as not to break under ordinary usage.

In making hits as they are commonly made now, and have been for a number of years, the first thing to do is to make the shank or pin end of the hit. This is done in various ways, some makers using axles, cutting them up and building what is known as a fagot, using as many pieces as may be necessary and welding them together into a har, which is drawn into the shape of the top end of the hit.

This is then cut off the har, or, in some instances, left on the har, the end being split; but previous to this process the steel is heated, drawn, and scarfed under a hammer in such a way that it can be locked into the end of the shank; it is then welded by taking a welding heat in the fire and drawing it down under the hammer.

This part of the process—the welding—is one of the most important of all in the making of a hit, and it should always be done carefully in a fire that has plenty of coke under the hit, so that the cold blast cannot come through. It makes but little difference how rapidly the metal is heated if the fire be large enough, but a great deal depends upon that part of it; a shallow fire is one of the worst things possible in doing this class of work.

The blade is formed and a concave is put in under the hammer with a pair of fullers. These fullers are made in various shapes and in accordance with the dimensions of the bit, or the order of the driller.

Another very important observance in making the hit is to get as much as possible out of each heat by working as much of the blade as can be managed at a single heat, instead of heating up the different parts separately. This method avoids all unnecessary heating and gives an even quality to the steel all through.

It is also necessary to watch very carefully that the fullers are not driven too cold, as this spreads the bit at a time when it is cold and puts too much strain at the center, which has a tendency to pipe the hit or split it.

Of course we all understand that if even the best of steel is hurt it is practically ruined, so it is necessary to be very careful in heating in order that there may be no burning or scorching of edges.

After the blade is formed and the end cut off to the proper shape to be easily dressed, the hit is turned around and the shank is finished; the square is drawn to proper shape and size; the pin is drawn down and the collar is finished to the size needed to go in the lathe; after being turned up it is ready for use in the well.

The latest and most modern hits, those that are most satisfactory in present day usage, are hits made of one piece of steel. In making a hit of this kind, the most important and necessary part of the process is to keep the fire at an even heat while working, being careful not to overheat in any way and not to hammer too cold.

The hit is drawn to any size and dimensions that may be required, the smallest hits drilling holes from 2½ to 3 inches diameter and the largest drilling a hole 36 inches diameter, or even larger in some instances. In the very largest hits it is necessary to make a few modifications, but hits can be made of practically almost any dimensions and still be entirely effective.

An important requirement in solid steel hits of the present day is that the pins shall not cup in use; some are very strong and stand an immense amount of hard usage before breaking. Another requirement equally important is that a thread which is provided for making a joint between the hit and the auger stem box shall be strong and stiff and not easily stretched.

After the hits are turned and finished it is then necessary to dress them to the proper size for the holes that are to be drilled, allowing a little clearance so that the body of the tool will not rub the edges of the well.

After the final heat it is set in a shallow tub of water which covers only the very end of the hit, where it is hardened as hard as possible and then drawn to the degree of hardness suitable for the work required or the kind of rock that may have been encountered.

When working in hard rock more care must, of course, be given in dressing a hit than where the rock is softer. How necessary it is that every point should be guarded in making a well hit will be appreciated when it is realized that these hits often operate in wells that are nearly half a mile deep,

*Proceedings of the Colorado Scientific Society.

while it is a fact that one well not many miles from Pittsburgh, Pa., was drilled to the depth of 6000 feet, or 720 feet more than a mile, the tool used in drilling being of ordinary size.

Radium.

The newest element discovered—radium—continues to interest all who follow scientific investigation. "The more it is studied, however, the more remarkable it becomes from every point of view," says the Iron Age, "and the results of recent experiments with it are so startling and threaten to undermine so many of what have come to be regarded as the basic truths of physics that even those for whom radium has no immediate or practical interest should be advised of its surprising phenomena. At the moment pitch-blende is the storm center of scientific controversy and the focal point of scientific interest. In it may lie a new source of power which will revolutionize not only mechanics, but possibly physics and chemistry as well.

"Up to quite recently radium was regarded much as calcium chloride had been in the days when luminous paint was a curiosity. It was known to possess the power of radiating light, but was supposed to possess this quality by reason of the fact that it had absorbed light from the sun's rays. The extremely interesting discovery of Sir William Crookes that the ions, or atomic emanations, from radium could be rendered visible changes the point of view from which this extraordinary mineral must be regarded. Professor Lippmann, of the Sorbonne, whose standing in France is equivalent to that of Lord Kelvin or Lord Rayleigh in England, seems to have established the fact that radium has the power of continually generating heat without drawing upon any external source of energy. If this be true, every one with the least or most superficial knowledge of physics will see at a glance that this phenomenon gives us a new science and compels a revision of our accepted ideas on many subjects. As has frequently happened before, Crookes' discovery of the heat generating properties of radium, while it comes like a revelation, is merely the recognition of properties inherent in many kinds of matter, and previously suspected, if not accurately described. The difference appears to be that radium possesses these properties in higher degree than any other substance at present known. Some, with a taste for excursions into the by-paths of scientific literature, will perhaps recall the generalizations of Seguin in explanation of a phenomenon which had puzzled the physicists.

"It was noticed many years ago that a coin or a print, if shut up in a box in proximity to, though it may not be in contact with, a sheet of blank paper, was found in time to have impressed its own image upon the blank sheet by a process of photography chiefly, if not exclusively, operated in the absence of solar light. These pictures were at first regarded as profound mysteries, explainable only by assuming that superhuman agencies had produced them. Seguin suggested the explanation that the bodies capable of producing this phenomenon did so by giving off a stream of impalpable particles projected from themselves with high velocity, and that these particles were capable of producing an impression upon what they bombarded. His hypothesis was received with hilarity by the physicists, to whom the idea of such a radiation of matter, even in infinite attenuation, going on forever without any sensible loss of weight or bulk in the mass drawn upon, was inconceivable. For that matter, it is inconceivable still, but it is becoming evident that Seguin discovered the only explanation of a series of phenomena which find their highest known development in the behavior of uranium and radium. The matter was practically forgotten until 1896, when Becquerel, in the course of some interesting and important experiments with the salts of uranium, observed that they maintained a constant radiation, that the rays thus given off possessed in common with the X-rays of Rontgen the astonishing power of passing through substances distinctly opaque to solar radiation, and that the rays thus transmitted through plates of metal, for example, were able to make a distinct impression upon a sensitive plate which would be acted upon by the actinic rays of solar light. If a small mass of uranium was inclosed in a light, tight box with a photographic plate, and an opaque object was interposed between them, the form of that object was distinctly reproduced upon the plate as in the shadow pictures of the Rontgen skiagraphs. The novel feature of the radiation from a crystal of any of the uranium salts was that apparently no exciting cause was needed to produce or maintain it. In the case of the Rontgen rays the application of external energy is necessary to excite the vacuum tube and produce the X-radiation. Uranium, however, has this energy within itself. Its radiation appears to go on continuously, and is apparently unaffected by any treatment to which the crystal is subjected, such as heating, electrification or solution in acid.

"If this be true—and all observations thus far made warrant the belief that it is—the axiom of physics that all energy is but the mechanical equiv-

alent of energy previously exerted to produce it, and that all work is but a credit to balance a debit previously recorded, would seem to need revision. The later experiments of Becquerel, and of M. and Mme. Curie, with uranium and the last addition to the group of elements found in association with it, radium, give us phenomena which in their relation to other phenomena so universal as to warrant the formulation of laws which have thus far not only passed unchallenged, but have satisfactorily accounted for pretty much everything dynamical, may very well pass to classification as miraculous. The fact that they are not miracles, but are manifested in obedience to a well-established natural law of invariable operation, has caused the physicists to look at one another and ask if it can be true that modern science has huddled upon a cornerstone which has crumbled under it.

"The assumption that the Becquerel rays, which have been recognized as originating in certain new elements of which radium is the most active of those thus far known, are not streams of material particles forever flowing from their source without diminution or change, but mere vibrations of ether, like the Hertzian rays employed in wireless telegraphy, would have saved a great deal of trouble, but unfortunately this was rendered untenable by the discovery that if such a stream of radiant energy was allowed to fall upon an electrified body it would discharge it precisely as a jet of tangible water would do. And now Crookes has made these rays visible, and Professor Lippmann has established the fact to the satisfaction of the French Academie des Sciences that radium is capable of producing sensible heat ad infinitum, without consuming itself or anything else so far as has been determined.

"Whether these discoveries have any economic value or not is of less immediate concern than the effect they will have on science. A century ago they would have been regarded as establishing the hypothesis of phlogiston as a property of certain kinds of matter, and we should be compelled to regard radium as the most highly phlogisticated of known substances. Probably we can do better, however, than to go back to that particular starting point for a new departure.

"Meanwhile, two questions of great interest will probably occupy the physicists for some time to come. One is, what property of matter permits any form of it to maintain a practically eternal energy in expelling a stream of fragments of its own mass? The other is, what is the form of matter thus projected? It has been assumed with some show of plausibility, as the result of calculations from the imperfect data now available, that the radiation of radium would in about 10,000,000,000 years reduce the mass about one grain in weight for each square inch of surface. Obviously it cannot be projecting the atoms of the Dalton hypothesis. These units of the molecular groupings, however small, would exhaust it at a much more rapid rate than that assumed in the case of radium. The form of matter expelled must be infinite subdivisions of the mathematical unit called the atom; perhaps the primordial matter of the alchemists. The narrow door thus placed invitingly ajar may lead to truths of which the students of the middle ages had a clearer perception than those of modern times, who know more and dream less, and whose imaginations are hampered by the desire to prove all things. It may be we shall be no happier and no better off when we know why radium behaves in a fashion so extraordinary; but the world is full of wise men who cannot rest until they do know, and it may very well happen to them, as it has to others, that in searching for the end of the rainbow they will find a great many things they were not specially looking for which are of immediate and immeasurable utility. That we could not usefully employ radium if we had it in masses is probably due to reasons which have discouraged the search for the universal solvent—we have nothing to keep it in."

Assaying Cyanide Solutions.

TO THE EDITOR:—I have noticed from time to time in your valuable paper different processes for precipitating solution assays in cyanide plant, all of which I have given a trial, but have found none as simple or more reliable than the one we are using at Smuggler-Union mill at Telluride.

FORMULA:—Take 875 c. c. solution or 30 A. T. in beaker, add about 2 grams zinc dust, about what can be lifted on knife blade or small spatula and about 50 c. c. Com. H_2SO_4 . Stir occasionally, allow to set until all action ceases, filter through 24 c. m. filter, burn and assay.

A less tonnage could be run for higher value solution.

The following flux is very satisfactory: Silica added to filter. Potas. carb., 1 pound, 5 ounces; hi-carb. soda, 2 pounds, 12 ounces; borax glass, 1 pound, 5 ounces; flour, 8 to 12 ounces; litharge.

While this method does not check out with the clean-up, still the relation is very constant, having at this mill never been lower than 80% or more than 81% of the gold; lower than 86% or more than 88% of the silver actually recovered in the clean-up.

Telluride, Colo., May 8.

A. H. JONES.

Deposition of Ores in Limestone.

Written by W. P. JENNY, E. M.

A study should be made of the structure of the ore-bearing limestones, with the special object of determining the causes that have made certain strata favorable for ore, while other beds in the same geological formation, having an almost identical chemical composition, and so situated that they are traversed by the same fissures, through which the mineral-depositing waters have been introduced, have remained barren. In many instances the productive and the barren strata are inter-bedded and so situated that the ore-bearing fissures cut through all the beds alike, without any change in this selective deposition of the ores.

Analyses of the ore-producing limestones are needed to determine the amount and character of the carbonaceous substances present, and also the minute traces of other elements, some of which may be found to have had an influence on the formation of the deposits. That such an influence may have been exerted seems probable, when we consider the enormous masses of the highly soluble limestones that have been dissolved or replaced in the creation of ore bodies. It has been shown, for example, that the small percentage of bitumen or other hydrocarbon contained in the rock, and set free by its dissolution, has strongly aided in the deposition of the ore.

Prof. Church, discussing the deposition of ores in limestone, says: "The operation of solutions whose composition we do not know can be judged only by their effects. When metasomatic replacement takes place in limestone, it is generally assumed that lime-carbonate goes into solution, while its place is taken by the ore substances—that is to say, that the action is molecular substitution, and not atomic; but it is conceivable that the change should begin by an interchange of acidic elements; that SiO_2 should drive out CO_2 . Subsequent changes might remove the lime-silicate by another process of substitution, since it is more soluble than silica. In the Tintic mines, of Tintic district, Utah, lime-silicate does not appear to have been formed; the silica directly replacing the lime-carbonate, or the carbonate of lime and magnesia, as the case may be; but the point is that CO_2 would be liberated, and though the original ore solution were free from CO_2 , it would immediately become charged with that agent and exert the well known dissolving power of carbonic acid solutions. In this way a solution which would have but feeble power in other rocks may in limestone set up a chain of reactions that would intensify its effects. Limestone contains the elements for self-destruction, since the breaking-up of one lime carbonate molecule may cause the solution of another; and as this cannot be said of any other rock, we reach a possible explanation of the comparative frequency of ore-bodies in limestone. The dolomites would, of course, present similar reactions." Prof. Church continues, respecting "The selection of a favored stratum for ore-deposition. In some situations the solutions, before reaching the stratum of actual ore-deposition, must have passed several strata, suitable for their action, if they had possessed from the beginning the power of solution which they showed ultimately. Ore-solutions exhibit a selective power which is extraordinary in a water fully supplied with dissolving qualities, but quite explicable in a solution which lacks this power."

Many contributory causes have in all probability co-operated in the deposition of the ore, such as decrease of pressure and reduction in the temperature of the solutions, the mingling of mineral-bearing waters of different chemical composition entering the limestone formation through distinct fissured belts, etc.; but the important factor appears to have been the great solubility of these limestones and dolomites in the waters which brought in the minerals, joined with the chemical activity of the contained hydrocarbons released in the dissolution of the rock.

In the solution of the limestone, the incidental liberation of large volumes of carbonic acid, ever dissolving more and more of the rock, set free a constantly renewed supply of carbonaceous matter, whose function was to remove all free oxygen and reduce the sulphates in the waters to sulphides. At the same time, the calcium and magnesium carbonates, when dissolved, neutralized the acids and destroyed the chemical equilibrium, so that the mineral-saturated waters could no longer hold the metals in solution, after the addition of the elements derived from the limestone. The combined action of the carbon, hydrogen, lime and magnesia contained in the rock was to deoxidize the solutions and bring them to the "critical point," when deposition of the ores rapidly took place.

The ores of primary formation in the Tintic mines have been, in most of the occurrences, deposited from highly heated solutions by the metasomatic replacement of the limestone; only in relatively subordinate amount have the metallic sulphides been

*Trans. Am. Inst. Min. Eng.

formed by crystalline growth in the rock, or by crystallization in the interspaces of the ore bodies.

In the instance of the Uncle Sam mine, in the large body of steel-galena, without quartz, replacing the fractured lime strata, the deposition seems to have been from solutions either free from silica, or more probably of so low a temperature that the chemical reaction in the substitution of quartz for the lime-carbonate could not take place.

In Tintic, the limestones, when unaltered, retain the included carbonaceous matter deposited with the sediments. In the ore bodies, all forms of the hydrocarbons have been destroyed, either in the primary formation of the minerals or in the subsequent oxidation; the deepest mines in the district (1700 and 2100 feet, vertical depth) not having reached ground-water level.

Whatever may have been the role of the volatile hydrocarbons in the original creation of the deposits, no evidence has been found of their ever having been present. Tintic district has been a center of intense volcanic activity, and it seems almost inevitable that, with the presence of notable quantities of bituminous matter in the rocks, volatile hydrocarbons should have been formed.

Many examples might be given of limestones, especially of magnesian limestones, which carry more or less organic matter and constitute the favored geological formations in the selective deposition of the ore.

A Steam Traction Engine.

One of the most notable features of the development of some of the mining regions of the West has been the employment of traction engines as a means of economical transportation. Particularly have these proven useful in the deserts of California and Arizona, where they have been of great service. In

McLaughlin Steam Tractor.

the lumbering regions also where mine timbers are cut and sawed, these machines have displaced animal teams to a great extent because of their high efficiency and economy. They run readily over any road where a team can haul loaded wagons, and make considerable grades with ease, drawing long trains of wagons at a rate of speed equaling that of animals engaged in the same class of work. The accompanying illustration is that of the McLaughlin steam tractor, manufactured by D. W. McLaughlin & Co., at Emeryville, Cal. The engine, the manufacturers say, is simple in construction, combining the maximum of power with the minimum of parts and weight.

Leveling by the United States Geological Survey.

One of the preliminaries in the preparation of topographic maps by the United States Geological Survey is the accurate determination of the elevations above sea level of numerous points in the area to be surveyed. These points are marked by what is technically known as "bench marks," which ordinarily consist of iron posts, $3\frac{1}{2}$ inches in diameter and 4 feet in length, set 3 feet in the ground. Each has a brass cap appropriately lettered, on which the elevation above sea level to the nearest even foot is stamped with steel dies. In the mountainous and rocky areas of the West, in addition to these posts, aluminum tablets lettered like the caps in the posts are set with cement in holes drilled in solid rock.

A law of Congress requires that this work shall be done in all localities under survey, and many thou-

sands of miles of lines have been run and marked in this way.

Level parties in the Rocky mountains are always provided with camp outfits, and consist of the levelman—who is also the chief of the party and must be a skilled man—a rodman, a teamster, and a cook. During the past season's work in the Rocky mountains there were parties of this kind at work in two or more localities in Montana, Wyoming, Utah, Colorado, New Mexico, Arizona, and Texas, in addition to those in the adjacent States.

Silver Mining and Smelting in Mongolia.*

Written by BENJAMIN SMITH LYMAN.

Mr. Woo's succinct description of the mining and smelting of silver-lead in Mongolia, with the roasting and reduction process and cupellation, has much interest as a picture of methods that not only may have been in use, as he suggests, a thousand years ago, long before the existence of mining schools or chemical laboratories, but probably very little, if at all, from the practice of prehistoric times, when King Priam's handsome silver vases, cups and bowls were formed. For it is highly improbable that such large objects were made from comparatively rare native silver, and the metal must have been smelted from ore, and most likely in great part from galena, with cupellation of the lead.

Dr. W. A. P. Martin, in his excellent book on "The Lore of Cathay," points out that Chinese alchemy is over 2000 years old, antedating the European by at least six centuries, and he infers that the Chinese skill in metallurgy and many branches of practical

(last) cake of slag of the preceding operation; $23\frac{1}{2}$ pounds of iron coins, or $19\frac{1}{2}$ pounds of new iron; 58 $\frac{1}{2}$ pounds of charcoal (costing about 1 cent a pound). The operation lasts two hours, and there are three operations in the morning; in the afternoon the hearth is repaired. The product is about 50 pounds of lead to each operation, or 150 pounds a day. The lead, except the poorer part, is cupelled by two women on a hearth of common wood ashes, and the litharge is afterwards reduced again to lead, with a loss of 25% to 30% of lead in the whole process. As already seen, the monthly product of silver ($1\frac{1}{2}$ pound avoirdupois) is about one-half of a tenth of 1% of all the lead. * * * * The smelting operations are extremely interesting, as agreeing closely in many respects with the processes of western countries, though they have apparently been handed down for many generations, and are the result of innumerable experiments made without any knowledge of the chemistry involved."

It now appears probable, from the close agreement with the Mongolian methods, that they must be the result of very ancient experimenting; so that they were introduced into Japan as an already established practice 1100 years or more ago. Pumpelly observed at Yurap, in Yesso, lead smelting by a method closely similar to that of Hosokura, with a furnace charge of like character and amount, but with a chimney above the furnace. The bellows used there and at Hosokura is like that of Mongolia.

The work in the Hosokura mines in 1877 was merely gleaned from former rich workings that had reached to 120 and 128 feet below natural drainage, and that had been finally abandoned in 1872. In one mine the water was raised 120 feet with wooden pumps in three lifts by 540 men working in three eight-hour shifts of 180 each. Pumpelly describes mine bailing in the Chinese province of Chihli, just like the Mongolian, but says that the men bailing were blind men—a characteristically practical idea in that country.

The open cupel bottom at Hosokura was much smaller than Mr. Woo's Mongolian one and was only a foot in diameter, but two of them were used for the 150 pounds of lead produced the preceding day. The ashes were smoothed into a gentle hollow with a paper bag full of ashes flattened into a lenticular shape, with the ends of the paper gathered into a sort of handle on the upper side. At the last touch the very middle of the bottom was slightly pressed with the smoother. Over the cake of lead on the bottom, charcoal in pieces 8 or 12 inches long and 3 inches in diameter were set up in truncated-cone fashion and kindled by some live coals inside. At the end of about three hours the fire was removed and the lead sprinkled with water, cooled and separated from the litharge. One bottom was then reformed and all the now remaining lead placed upon it and treated in the same way for another three hours, and then cooled off as before. Then a smaller bottom, hardly 9 inches across, was formed, but with a depression in the middle $\frac{1}{2}$ inch deep and $1\frac{1}{2}$ inch across; and, under like treatment again, the brightening came in about two hours. The woman in charge quickly cooled the silver by blowing on it through a small bamboo tube; removed the cake of litharge, with the silver still red below, and poured on water. The silver button weighed about $1\frac{1}{2}$ ounce, troy. The second melting, it was said, made less litharge than usual, and, consequently, the third more in a longer time than usual, "because the ashes were bad." They are from any kind of wood, and are bought by weight from the country people, who are apt to mix loam and sand with them to increase the weight.

Mr. Woo's straightforward, clear paper is an earnest of much light that may be expected before long to be thrown upon many obscure oriental and archaeological matters by Chinese trained in western science, and, at the same time, otherwise well fitted and conveniently situated for such fascinating investigations.

The Randsburg Mining District Mapped.

A topographic map of the country adjacent to the Randsburg and Johannesburg mining districts, California, is now in press and will soon be issued by the United States Geological Survey. The area covered by this map is known as the Randsburg quadrangle, and embraces almost equal portions of Kern and San Bernardino counties, and shows part of the location of the Randsburg railroad, which connects Johannesburg with Barstow, San Bernardino county.

The scale of this map is approximately 1 mile to 1 inch. The contour vertical interval of 50 feet shows well the topographic features of the region. All roads, trails, mines and houses are shown with great exactness, and—most important in such an arid country—the positions of all wells, springs, reservoirs, and dry lakes are accurately located. This section is practically a desert, and unless water can be found within reasonable distances and at depths easily reached from the surface, prospectors and miners cannot prosecute their work. The water for Randsburg and Johannesburg is piped from wells about 5 miles northeast of these places. It is of fairly good quality but is insufficient in quantity, and while the water company charges are not there regarded as excessive, the lowest rates would as-

chemistry owes its origin to "those early devotees of the experimental philosophy who passed their lives among the fumes of the alembic." Those alchemists, however, may have more likely derived some of their leading ideas from the mysterious and at that time wholly unexplainable results observed in already very ancient metallurgical processes, in which, for example, certain stones were transmuted, as it were, into metals widely divergent in character from their ores, and even silver and gold were obtained from the most unlikely looking materials. It is, therefore, in any case, not improbable that the Chinese may have preceded western nations in the discovery of metallurgical methods.

At all events, it is now evident that the Japanese acquired these arts from China, the former source of all their higher civilization. My own observation of old fashioned silver smelting at Hosokura, on the main island of Japan, and about 220 miles northerly from Tokio, agrees so well with Mr. Woo's in Mongolia as to show the common origin of the methods, and that they have not probably changed in any important particular since the first opening of the Hosokura mines about 1100 years ago. The precipitation process was used there and was briefly noticed in my report on the second year (1877) of the survey of the oil lands of Japan, published at Tokio, in 1878, as follows:

"The galena is smelted in a small furnace or hearth (now only one), about $1\frac{1}{2}$ foot in diameter, with the addition of iron in the form of old coins. The charge is (in our pounds): 83 $\frac{1}{2}$ pounds of ore and the third

*Trans. Am. Inst. Min. Eng. Discussion of Y. T. Woo's paper.

tonish those who are not familiar with this desert country. Persons occupying houses or tents without water pipes usually pay \$1 a barrel for water.

The whole area represented on this sheet is one of the most forbidding deserts in the United States. The valleys are practically sand beds, the mountains bare masses of rock. The only vegetation in the valleys is scattered, low cactus, with here and there a greasewood or creosote hush about knee-high. The mountains are absolutely devoid of grass or trees.

The mineral wealth, principally gold, constitutes the whole value of the country; but this is sufficient to have built up during the last few years the flourishing mining camps of Randshurg and Johannesburg, with an aggregate population of about 1200.

Ore Treatment at Mt. Lyell.*

NUMBER II.

The method of metallurgical treatment has remained the same as at the start—i. e., direct pyritic smelting, with the use of only a very small percentage of carbonaceous fuel and with a heated blast, and subsequent bessemerizing after Manhes. The type and details of the blast furnaces have required no alteration from the original design. The use of a hot blast for the furnace treatment has been proved by experience to be obligatory and not to be circumvented, as indeed is demonstrated by a careful investigation of the thermo-chemistry of the method. The process, as a whole, is divided into three stages—i. e., two smeltings into matte and the converting of the enriched matte into blister copper.

The quantity of coke used in the blast furnace smelting, when calculated on the ore, is about 5% in current work for the twofold furnacing and 6% on the ore, including all incidental coke for blowing in purposes and similar occasional use, while on all the material fed into the furnaces, less coke itself, the percentage is only 3½ for the double smelting. It can hardly be maintained that so small an addition of coke has any vital bearing on the furnace reactions, from a heat point of view, and it is commonly remarked that the coke simply serves to keep the tuyeres from becoming too hard. It is fed along the long walls of the furnaces with this special object in view. Such low percentages of coke are only possible owing to the application of the oxygen of the atmosphere to the ore mixture under conditions which make the oxygen perform a function somewhat different in its effect from that which it exercises in ordinary blast furnace smelting, where a larger percentage of carbonaceous fuel is necessary. In all three stages of the process the material (ore or matte) is constantly subjected to an oxidizing action, and not a reducing one. The process, therefore, in this respect is the direct inverse of ordinary smelting operations in blast furnaces. A potent factor establishing the feasibility of the furnace smelting is the presence of a heavy percentage of iron and sulphur in the Mount Lyell pyrites, which elements yield a sufficient quantity of heat during their combustion or union with the oxygen of the atmosphere, to allow the solid products of combustion to remain in a superheated molten condition. This peculiarity also distinguishes the bessemerizing operation. In fact, it may be said that the Mount Lyell ore smelting is nothing more than a bessemerizing of ores, or matte therefrom, direct in blast furnaces, but so managed as to be continuous, and not intermittent, as is the bessemerizing operation, and also under perfect control, both as to the composition of slags and mattes and the proper mechanical separation of these two products. The company remains to this day the only instance of this idea being utilized on a large scale as the exclusive method of treatment. The entire length of time occupied by the transition of the copper in the ore from the latter into blister copper—i. e., from the moment the ore enters the first furnace until the blister copper issues from the converters—is only from five to six hours, if the time lost through cooling and transportation between apparatus is disregarded. An essential condition of success is rapidity of treatment, for it is only by this means that the necessary heat is concentrated to the required pitch.

The blast furnaces were blown in successively on the following dates: No. 1, June 25, 1896; No. 2, Oct. 6, 1896; No. 3, June 24, 1897; No. 4, Sept. 13, 1897; No. 5, Sept. 13, 1897; No. 6, May 26, 1898; No. 7, Oct. 3, 1898; No. 8, Oct. 18, 1898; No. 9, Jan. 26, 1899; No. 10, May 8, 1899; No. 11, June 29, 1899.

The blast furnace slags vary between the following limits of composition, the furnace charge for ore smelting and matte concentration differing somewhat from each other. Limestone is used only in the latter operation and not on the ore. The first matte is resmelted by itself, as a rule, i. e., very exceptionally has pyritic ore been used with it:

	Per cent.
Silica	36.66 to 41.70
Iron protoxide	50.67 to 43.14
Calcium oxide	1.20 to 8.16
Barium oxide	1.90 to 0.16
Alumina	7.47 to 5.46
Copper	0.25 to 0.35

The flue dust is ground up and mixed in a steam-driven mud mill with about 4% of common clay and the addition of a little water, and no lime is used for binding. The briquettes are of the size of ordinary bricks, are made by hand in preference to presses and weigh about fourteen pounds each. They are laid on shelves in a large drying room and rough dried by the heat of pots of slags ranged alongside. The quantity of flue dust so handled was 4666 tons for the year. Its average assay was: Copper, 3.5%; silver, 2.5 ounces; gold, 0.07 ounce. It contains about one-third silica, which comes from the dust and sand accompanying the quartz flux. More elaborate means of preparing the flue dust, like fusion in a reverberatory furnace, molding and burning in closed kilns, as well as a briquetting machine of good repute, have been given lengthy trials, but have all been discarded on account of being too expensive, and preference finally given to the present means, which is primitive in character, but more satisfactory in regard to cost and efficiency. The flue dust is partly oxidized, but there are not sufficient sulphates in it to act as binding material for machine briquetting, and the cost of the obligatory lime has decided against the method.

The system of getting rid of the slag by granulation has been in use since the start, but of late years it has become necessary to resort to mechanically raising the accumulating dump of each smelting plant to a higher level, to keep the talus of the dump within bounds. This is effected by centrifugal pumps of a special construction—the outcome of the simplification of prevalent types and adaptation to the special work to be performed. The pumps are at present steam driven, but will shortly be run by electricity. The slag pumps are of small diameter, 10-inch suction by 9-inch discharge, with 18-inch heaters or vanes, and are run at 540 to 600 revolutions per minute. The quantity of slag elevated during the year was 170,000 tons at No. 2 plant and 40,000 tons at No. 1 plant, together with all the water entering the two smelting plants, with the exception of that used for steam generation, sprinkling, etc. The respective lifts are 15 and 11 feet at present.

The new sampling works, which were erected in place of the original mill which was destroyed by fire a couple of years ago, treats the samples of all ores and mineral fluxes, also purchase ores used, and prepares them for the assay office. The proportions taken in transit and delivered to the sampling works are: Every twenty-fifth ropeway bucket of open-cut pyrites, every sixteenth truck underground ore, every eighteenth truck of mineral flux, while the proportion of purchase ores varies from all to one-quarter to one-eighth. The balance of lot goes direct to the furnaces; none of the ores, etc., are specially crushed, but are smelted in the size as broken at the mines.

CONVERTER PLANT. — The converting operations were conducted in conformity with the amount of matte produced by the blast furnaces. The bessemerizing plant is a double one, i. e., consists of two independent equal sized departments, each with facilities for turning out from twenty-five to forty tons of copper a day. The total number of vessels is fourteen (twelve in use), vessel stands, six; and there are two remelting furnaces with a No. 5 rotary blower each, with vertical engine attached; two high-class Allis-Chalmers' horizontal compound condensing blowing engines, 16 inches and 24 inches by 30 inches, with air cylinders 30 inches by 30 inches, delivering 3000 feet of free air at sixty revolutions; a 14-inch by 3½-inch by 10-inch by 10-inch duplex high-pressure pump; an accumulator; and all other necessary paraphernalia for the handling and tilting of the vessels, including hydraulic cars for shifting same, travelling crane, etc., together with the necessary machinery, grinding pans, etc., for the preparation of the vessel linings; also drilling machines for drilling the blister copper for sample. Steam is supplied by four 70 H. P. multipolar boilers. In the motive-power department the average indicated horse power developed for the year was 300, and the amount of wood fuel consumed 13,043 tons. The average blast pressure is eight pounds per square inch at the vessels.

This portion of the reduction works is also unique, for it is the only case of bessemer works for copper in Australasia. The first converter was started on continuous work on Jan. 14, 1897. The style of vessel is that known as the Stalman type, which has proved eminently satisfactory, and slight in repairs, to which latter fact the square shape of the vessels has essentially contributed. The tilting gear is extremely simple and effective, the rack being on the cylinder itself, which travels horizontally on the hollowed piston rod, through which the pressure water enters and leaves.

The clay for the vessel linings is a fine white variety of refractory nature, won in the immediate vicinity of the converter plant, and the silica is supplied by the screened fines or refuse from the quartz crushing plant at the quarries. In these important respects

the company is therefore fortunately situated. The composition of the clay is the following:

	Per Cent.
Silica	62.52
Alumina	23.89
Iron oxide	0.26
Calcium oxide	0.25
Magnesium oxide	0.40
Water and undetermined	12.68
Total	100.00

The number of "blows" which a lining will stand until corroded so thin that the vessel has to be removed is from five to seven.

The production of the bessemerizing plant for the four quarters of the year is given above, under the output of the furnaces in metals. Since the beginning of operations to the end of the company's last half-year (March 31) the total results are as follows: Blister copper, 40,168 tons, of an average assay per ton of—copper, 98.83%; silver, 81.36 ounces; gold, 3,124 ounces; containing—copper, 39,698 tons; silver, 3,268,016 ounces; gold, 125,498 ounces.

Adding on the production for the last quarter, the figures become the following, from the commencement of work to July 1, 1902: Blister copper, 42,060 tons; containing—copper, 41,568 tons; silver, 3,439,149 ounces; gold, 131,053 ounces.

The quantity of converter matte treated by the converters from the beginning to March 31 is 87,229 tons, of an average assay of—copper, 49.48%; silver, 39.34 ounces; gold, 1,480 ounces.

The blister copper is now poured into plates, or cakes, measuring 16x24 inches and 2½ inches thick, the former bars or pigs having been abandoned. Five hundred plates constitute a lot or parcel of fifty tons, the sample of which is kept distinct. Sampling is done by drilling two ½-inch holes through each plate, with power-driven drill presses. The blister copper is all shipped to the United States, via London, and is refined by the Baltimore C. S. & R. Co. in Maryland, on a toll arrangement, the products being turned over to the company. The products, i. e., electrolytic copper, as ingots, wire bars, etc., on the one hand, and fine silver and fine gold on the other, are sold by the company, the two precious metals being disposed of at the United States mints, and the copper in the open market. It is chiefly exported to Europe, its identity being merged in that of the brand, "B. E. R."

(TO BE CONTINUED.)

The American Negro for the Rand.

TO THE EDITOR:—I notice in to-day's issue of your paper a leader on "The American Negro for the Rand." I presume the letter I wrote to the Mining Journal (London, Eng.) was the cause or reason of your leader, as the quotation "two shillings per day and rations" was in the letter. I wish it to be understood that two shillings (i. e., fifty cents, approx.) per day and rations was the minimum wage to be offered—as this is, I believe, the minimum at present paid the natives. Furthermore, if you read the entire letter, you would have seen that I stated that the stockades would have to be replaced by bunk-houses for the single men and cottages for the married ones—it being taken for granted that these quarters were rent free.

Fifty cents a day with board and lodging is quite up to the average earnings of the colored people in the South. Another thing to take into consideration is that the work would be steady. Colored families would be able to do very well, as the girls could go into domestic service in Johannesburg and earn good wages. As I stated in the original letter, the entire success of the experiment would depend on how the first lot of emigrants were treated. The mine owners are beginning to "recommend the adoption of the expedient of Asiatic labor" but "not with a light heart," (see speech by Mr. George Alhur on April 15th at the meeting of the General Mining & Finance Corporation). The feelings of the majority of the workingmen (white) on the Rand were pretty clearly demonstrated at a recent meeting held Johannesburg to discuss the question—the only people present (viz., two) who were in favor of the importation of Chinese had to flee for their lives.

Oroville, Cal., May 9. RALPH L. MONTAGU.

A Word of Warning.

TO THE EDITOR:—Within the last four months, an individual well acquainted with the conditions of chemical laboratories of manufacturing plants, especially iron and steel works, is plundering the chemical laboratories in Virginia, West Virginia and now Ohio, of their platinum ware. We have had over a dozen of such robberies reported within the past four months, and from the way the thief goes about it clearly shows that he must have been a former iron chemist, thoroughly acquainted with the conditions of the chemical laboratories in the district mentioned. From what we now learn, he is now travelling up the Ohio river, getting into Pennsylvania, and a great service can be done by your valuable medium if you make these facts known, to put the chemists of iron, cement and steel, etc., works on their guard against him.

New York, May 9.

*From the report of the Secretary of Mines, Tasmania.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 5, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

FURNACE FOR ROASTING AND SMELTING ORES.—No. 726,861; A. W. Catton, West Seattle, Wash.

A furnace for roasting and smelting ore having hearths and central bullion well, hearths of furnace sloping toward central bullion well and having bridge walls at outer sides, top of furnace being curved above hearth and above flues leading upward from side superheating chambers to deflect and direct flames against ore on hearths, charging hoppers at point where flames are directed from flues to and over hearths, superheating chambers at each side of furnace, superheating flues leading from chambers and forming junction with smoke flue, pivoted gate damper at junction of flues to change draft alternately from one side of furnace to other, and steam nozzle within sleeve-shaped air intake discharging against gate damper and imparting forced draft to furnace.

BLAST FURNACE.—No. 726,893; N. Erzsig, Chicago, Ill.

In blast furnace, combination of smelting chamber having at upper end a feed chute; hell controlling chute; hopper-shaped screen secured within chamber below chute; second bell controlling discharge of material retained in screen; screen being vertically movable in chamber; means for raising and lowering screen; means for operating bells independently of each other and independently of position of screen.

GOLD DREDGER.—No. 726,262; G. F. Barnes, Arcola, Ill.

In gold dredging machine, scow or float, crane having swinging connection therewith, boom supported by crane, suction pump on scow or float, suction tube leading therefrom and having its lower end con-

nected to boom, plate connected to lower end of boom and spaced from inlet of suction tube, means for causing movements of parts.

AGITATOR FOR OIL WELLS.—No. 726,899; A. B. Gahagan, Glade Mills, Pa.

In agitator for oil wells, combination with working barrel, of coupling connected to working harrel and having receiving chamber surrounding same provided with sprayer jets leading therefrom, coupling having valve-controlled passageway therein communicating with receiving chamber, and revoluble means for opening and closing passageway.

CENTRIFUGAL ORE SEPARATOR.—No. 726,948; G. Land, Denver, Colo.

Ore separator, rotating bowl having axially arranged discharge pipe for valuable slimes depending through bottom of bowl and rotating therewith, deflecting hood secured to upper end of discharge pipe, annular deflector encircling hood and slime outlet pipe and terminating above bottom of bowl, and ore inlet pipe above hood and in line with outlet pipe.

CALCINING FURNACE.—No. 726,915; C. T. Hennig, London, England.

Furnace of class described, combination of one or more interiorly horizontally flattened stationary chambers provided with internal conveying means with a vertical stationary empty chamber of considerable length and having an opening for admission of heated gases near lower end so that materials falling through may be exposed to action of heated gases rising through it, and having opening for discharge of materials at lower end below admission opening, flattened chamber or chambers being placed above

final chamber, all of the chambers being connected and so constructed that each successive chamber in series forms an angle with chamber preceding, first or uppermost chamber in series having openings for escape of gases and evaporations and admission of materials.

MINE MODEL OR EXHIBIT.—No. 726,140; N. P. Hill, Colorado Springs, Colo., and J. R. Chamberlin, New York, N. Y.

Transparent mine model or exhibit consisting of two or more plates of glass or transparent material suitably clamped together, upper plate or glass being ground or shaped to show superficial outline of land below which mine is located, plates being perforated vertically or at right angles to represent mine shaft or incline, and veins and dikes which traverse mine, and being provided with horizontal cuttings to illustrate drifts or tunnels at various levels below surface.

APPARATUS FOR TREATING ORES.—No. 727,362; H. Hirsching, San Francisco, Cal.

Ore treating apparatus including leaching vessel, settler, filter, still, lime still, tank containing condensing coil, absorption tank for vapors, stock solution tank, water tank, and boiler to supply heat to first mentioned still, so produced vapors from still being partially condensed in coil tank, and vapors not condensed therein being absorbed in absorption tank, parts being connected together by means of pipes.

PROCESS OF TREATING REBELLIOUS ORES OF THE RARE METALS.—No. 726,884; W. P. Downs, Jersey City, N. J.

Process of treating ores containing rare metals and rebellious elements consists in intimately mixing ore with sodium compound and agent capable of releasing metallic sodium therefrom, heating mixture to temperature sufficient to release sodium whereby combination of sodium with rebellious elements of ore results and leaves metal to be recovered distributed throughout mass, permitting volatile impurities and compounds to escape, recovering desired metal.

METHOD OF TREATING REFRACTORY ORES.—No. 726,184; R. McKnight and M. Satarasky, Philadelphia, Pa.

Consisting of roasting ore with access of air and agitation but shut off from products of combustion, until oxide of metalloid is formed and passes off, together with metal in ore in finely divided state, collecting fumes arising from ore, in receptacle containing solution of chloride of alkaline or alkaline-earth metal and converting in receptacle, oxide of metalloid into acid, and replacing hydrogen of acid with alkaline or alkaline-earth metal, setting free nascent chlorine, and forming a chloride therewith of metal values in finely divided state.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCHISE COUNTY.

The Chicago & Arizona C. Co., with headquarters at Wilcox, has been organized, and has bought the Casey copper mine in Dos Cabezas district. T. B. Chattman, W. F. Nichols, P. B. Soto are the officers.

The Bisbee-Queen Dev. Co. has incorporated at Bisbee to operate twenty-four claims in Gold gulch, near the Calumet & Cochise group, 3½ miles southeast of Bisbee. The officers are B. F. Graham, R. I. Benton, J. E. Suits, J. H. McKim, W. L. Hargrove.

The Lake Portage & Bisbee Co. will increase development work on their mine, near Glance. Several cars of lumber are on the ground and a double drum hoist will be set up. A diamond drill will be used for prospecting the ground.

The Solomon Springs Con. C. Co.'s mines have been sold to Calumet, Mich., men and the first payment made. The property adjoins the Bisbee Con. and the Copper Glance in Glance district, near Bisbee.

W. Holmes of the Leadville M. Co., operating in the Dragoon mountains, 8 miles south of Pearce, says they have a body of copper ore averaging 12%. They have a group of eight claims, which are on a contact between porphyry and lime. There is also an iron dike running the entire length of the group, 100 feet wide.—The Great Western C. Co.'s group adjoins the Leadville on the south.

The Ivanhoe group of twelve claims have been sold to Michigan men for \$140,000 and first payment made. This group is between the Calumet & Cochise and Portage Lake & Bisbee, and is 2½ miles from Bisbee. The company is the Quincy & Arizona M. Co., organized last week at Hancock, Mich. J. Wilcox, J. Croze and E. L. Wright are officers.

GILA COUNTY.

The Troy-Manhattan C. Co. have seventy-five men on the payroll, most of them on development work on the Troy group of mines. Work was started last week on the Alice tunnel, which will be 1500 feet in length and tap the Alice lode at a depth of 700 feet. This tunnel will answer the double purpose of draining the mine of water and for the delivery of ore. A tramway will be built from the mouth of the tunnel to the site on the Gila river where it is proposed to place the smelter, says the Silver Belt.

In the Old Dominion Co.'s main four-compartment shaft sinking has been interrupted to cut a station at 130 feet, which will correspond with the third level in the old workings. The total depth of the shaft is 150 feet. Two steam hoists are used to facilitate shaft work. Grading the smelter site is expected to be finished next week. The smelter is making the usual output and shipments of copper and matte are being made regularly. The bins are full of coke and arrivals continue.

Work has been started on the fourth and sixth levels of the copper Hill mine, near Globe, and drifts are to be extended and several crosscuts run.

MOHAVE COUNTY.

(Special Correspondence).—The Minnesota mine, owned by the Philadelphia & Arizona M. Co., is doing little work this season.—The silver find by J. Carroll, between the Juno and Mormon Girl mines, showing up 2 feet of ore carrying good values in silver.—F. Tufty reports finding a quartz ledge carrying native silver, near the Gladstone mine, near the summit of Sherum's peak. This is also near the recent gold find made by J. Flynn, but on a parallel vein one fourth of a mile away.—At the Samoa mine, being worked by Hoffman Bros., a carload of ore is being gotten out that runs 2000 ounces silver per ton.

—R. J. Ferguson's negotiations for sale of Clyde and Redemption mines are still pending.—Another strike is reported in the Paymaster mine, near Mineral park, owned by J. Dunbar and J. C. Noble. Chloride, May 9.

The Gold Road M. Co., operating the Gold Road mine, near Kingman, will put in a number of gasoline engines at the mill and at the mine.

O. A. Pease, president of the Amalgamated G. M. Co. at Quartzite, says development work will be increased this summer on their gold and copper mines.

Material is on the ground for the narrow gauge railroad to be built by the Mohave G. M. Co. from their millsite, near Needles, Cal., to the Leland-Mitchell group of mines, a distance of 18 miles. ore cars will be built of steel, equipped with air brakes, and have a capacity of

seven tons. Work on the 40-stamp mill is progressing. Water for the use of the mill will be pumped from some of the lakes near the mill.

It is proposed to remove the mill at Mineral Park from its present location to the Keystone mine, where it will be remodeled and converted into a concentrating plant. J. Uncapher and J. Detar are the owners.

Ten miles from Chloride, M. Dempsey and W. O'Dea are opening up the ore body which they struck in their group of claims last week. They have a 10-inch shoot which assays \$100 per ton. The entire ledge is 40 feet wide.

PIMA COUNTY.

Work will begin next week on the Sam Hall group of mines, near Southern Bell, near Tucson. The ledges show free gold averaging \$7 per ton.

SANTA CRUZ COUNTY.

The Oro Fino Development Co. have taken over the Gold Rock Con. group and are refitting the mill building and will put in a cyanide plant.

YAVAPAI COUNTY.

(Special Correspondence).—Work is progressing on the mill being built by the Golden Link M. Co., at Hillside, under C. E. Bunker, constructing engineer. It is expected to have the plant in operation by June 20.

Hillside, May 10.

A hoisting plant will be put in at the Electra mine, south of Prescott, the main shaft of which will be sunk to a depth of 1000 feet. The ore carries \$15 gold and 10% copper per ton. There are 500 feet of development work.—Twelve men are at work on the Black Rock mine and grading for a 75-ton per day mill and a 52 H. P. hoist.—The Arizona G. M. Co. will put up a 22 H. P. hoist on its mine near Prescott, which has 600 feet of development work.—Adjoining the Keystone mine, the Golden Rule M. & E. Co. are developing some gold and copper claims. Mrs. L. Brill is president.—The Con. Angel M. Co., controlling the Angel and Bess mines, will put on men and develop the properties.—The Ryland lead and silver mine, near Wickenburg, Maricopa county, has been taken over by the Arizona M. & D. Co. It is thought the Wickenburg smelter will be moved down the river to handle the Ryland ore.

The Jerome Canyon Copper Co. are putting in a 40 H. P. compressor and a 50 H. P. hoist. Owing to an inflow of water in the lower workings, they will put in a sinking pump. The 200-foot crosscut from the 330-foot level to strike the ledge will be completed this week. Two machine drills are in operation.

The Mesa G. M. Co. have started work on a tunnel on its group of mines near Bigbug, near the Poland tunnel. The tunnel is in 90 feet and will be driven 300 feet to tap the Mesa ledge.

The shaft of the Chicago mine at Groom Creek has been timbered and sinking is in progress. It will go down 400 feet, giving a total depth of 550 feet. They expect to figure on a mill later on.

The Prescott Courier says a deposit of red rock has been located near Prescott, a sample of which is said to have given 20% aluminum. The rock is of a chalk-like consistency. The polished piece of red rock in the plaza fountain came from the deposit. [Without seeing a sample of this rock, it appears from its description to be the mineral heauxite, which is mined in Alabama, Arkansas and Georgia for its aluminum contents.—Ed.]

Manager J. F. Holden of the Coronado G. M. Co., says work began this week on their mines, 1 mile north of Congress.

The Monarch G. & C. M. Co., near Jerome, will resume work this month, and a shaft will be sunk to water level and a drift run into the El Capitan claim.

The Jerome Reporter says the McCall group of claims on Ash creek, near Jerome, is sold to Pennsylvania men for \$40,000.

CALIFORNIA.

AMADOR COUNTY.

The old mill at the Kennedy mine, near Jackson, was started up last week, making seventy stamps dropping in the two mills.

At the Zeila mine, near Jackson, the mill is running thirty of its forty stamps and the chlorination works are in operation.

At the South Eureka mine, near Sutter Creek, Superintendent J. Truscott says a body of pay gravel has been struck on the level recently opened and the 20-stamp mill will be started next week.

CALAVERAS COUNTY.

The Fannie Marie M. Co., operating near Mokelumne Hill, has taken on more men and work will be directed principally on the Bluejay mine, which is using electrical power.

At the Rooney gravel mine in Chili gulch, near Mokelumne Hill, bedrock has

been struck, with a showing of 9 feet of gravel which is reported to prospect well.

Operations continue on the Gumboots mine, near Esmeralda, says Manager E. H. Nutter. Grading is being done for additional machinery.

The 10-stamp mill on the Paragon mine, near Railroad Flat, is being moved to the Easy Bird mine, at Mokelumne Hill.

The mill on the Rose Rock mine at Murphys is expected to start up next week.

The Garibaldi mine has been bonded to Pueblo, Colo., men and development will begin by June 1.

The Golden mine, near Vallecita, will be reopened.

At the Orlole mine, near Angels, the mill is running steadily.

All work at the Carson Hill Con. mine, near Irvine, has been suspended.

Operations on the Boston quartz mine at Mokelumne Hill resumed last week. There is a 1000-foot shaft, but work was abandoned four years ago. Superintendent Burleson says that as soon as the workings are unwatered men will be put to work on development.

The Montana mine, on Salamander creek, near San Andreas, has resumed and new machinery is being put in, says Superintendent Thomason.

The Star of the East mine at Rich Gulch reports the vein cut at depth of 200 feet, showing 3½ feet of ore with a 4-inch pay streak. The walls are black slate.

EL DORADO COUNTY.

G. Nonguesser, owner of the Baltic mine, near Placerville, started his mill crushing ore last week.—G. Estey has bought the Edner gravel claim at Omo and has begun work hydraulicking. He also has men at work on the Whim mine.

E. P. Colgan, vice-president, and F. H. Hood, manager, of the Rio Vista Copper Co., have started work at their mine at Fairplay. Lumber for the plant and buildings and machinery are being hauled in.—Mott & Co. have men at work on the Alexandria mine near Placerville.

The Mt. Pleasant mine, near Grizzly Flat, is being unwatered.

B. McBeath, superintendent of the Monte M. & M. Co., says a 5-stamp mill and other machinery will be put in on the Del Monte quartz mine, Gold Hill district, near Placerville. A ditch from the river will bring water for power purposes. The Del Monte is a tunnel proposition and two tunnels have been run and a body of ore blocked out that assays in free gold values.

FRESNO COUNTY.

The California Oil Fields, Ltd., at Coalinga, brought in another producing well by finishing its No. 11 last week. This company has fourteen producing wells, with some bringing in as much as 800 barrels per day. Drilling has started on both Nos. 12 and 13.

At Coalinga work has been indefinitely suspended on the well of the Union Oil Co. on Section 24. The Caledonian Oil Co. has rigged up for its No. 2 well.

KERN COUNTY.

From all the Kern county fields during April the total oil shipments were 4200 cars.—The Fulton at Sunset is down 600 feet on their first well.—The West Shore Co. well, No. 8, is making a daily average of 300 barrels.—The Gilt Edge has abandoned its search for oil on the plains to the eastward of the proven bounds at Sunset. The drill was sent down to 1600 feet, but indications at that level did not warrant continuation of work, says the Reporter.

The Pearl Wedge, near Randsburg, had a milling at the Atkinson mill last week—nine and one-half tons netting \$90 per ton, says the Randsburg Miner.—E. Harris has taken a contract for a 150-foot tunnel on the May Queen at \$5 a foot. This mine adjoins the Minnehaha.—E. Hammond and S. Oakley have begun operations on the Orphan Girl.

G. A. Phillips and J. A. McDonald are leasing on the La Crosse mine in Stringer district, near Randsburg, and have struck ore. They expect to have a milling next week.—The Johannesburg G. M. Co. report a strike of high-grade ore on the St. Elmo group, near Johannesburg, and a 10-stamp mill will be built by July 1.

MARIPOSA COUNTY.

Fifty mining locations have been made in Mariposa county since March 1, the claims being mostly near Quartzburg and Coulterville.

At Whitlock the Austin Group M. & M. Co. are putting on more miners and increasing development work. Two shifts are working in the Golden Gate tunnel, another of the claims bonded by the company. It is intended to run a tunnel from the Golden Gate through the Coronado to connect with the shaft being sunk on the Ragan for a working tunnel and also to prospect the Ragan ledge. Through this tunnel the ore can be handled cheaper and brought closer to the mill.

MONTEREY COUNTY.

The Combined Oil Land Co. are drilling their first well near San Lucas and are down 100 feet.

NEVADA COUNTY.

At the Standard mine at Deadman's Flat, near Grass Valley, the hoisting works and steam plant are in operation.

At the Grass Valley Con. mine on Osborn hill, near Grass Valley, a shoot of ore has been opened up on the 800-foot level showing 20 inches wide, with pyrite, galena and free gold.

N. W. K. Schoorel, of the Rustlers' M. Co. of San Francisco, has a bond on the Junction mine at North San Juan and development work will begin this month. Machinery, including a rock breaker, concentrator and mill, will be put up at the mine, which adjoins the Boss mine. Electric power will be used. H. Huckins is superintendent.

At Mooney Flat, near North Bloomfield, the Pickley drift claim, which is being opened by Wheatland parties, a vertical shaft has been sunk 40 feet and the sump is in gold-bearing gravel that pays \$6 to the carload. A hoisting and pumping plant is being put in and the shaft will then be continued down to the bedrock, which is some 80 feet below the surface.

C. Stocks, superintendent of the Jenny Lind mine, has bonded the St. John's mine on Alta hill, near Grass Valley.

The Crystal Lake G. M. Co. has resumed at Meadow Lake, 8 miles from Cisco, Placer county, after a two weeks' shutdown, due to the pipe line being displaced by the heavy fall of snow, causing a lack of water. The mill was overhauled and the pipe line repaired.

A. West, operating on the Last Chance group of mines on Diamond creek, above Mayhert, says development is being increased and more men put to work. The 10-stamp mill is being put in running order.

PLACER COUNTY.

The Pingston mine, near Colfax, has closed down for an indefinite period.

Superintendent J. L. Grimes has men at work at the Herman mine, at Westville.

PLUMAS COUNTY.

H. D. Allert, secretary of the Continental M. Co. of Langdon, S. D., says the company has bought the Jones group of placer mines in McRea Ridge mining district, near Johnsville, J. M. Engle and B. L. Jones, the former owners, retaining a small interest, the latter acting as superintendent. The mines are 8 miles southwest of Johnsville, near the head of Nelson creek, and cover about 2 miles of the "blue lead" channel. The Continental M. Co. propose to fully equip and develop the group and will build three reservoirs for storage of water, and also a restraining dam. Water will be applied under 450 feet head. There are to be flumes and pipes for three monitors. An electric lighting plant will be put in. J. M. Engle of Quincy is Western representative.

SAN BENITO COUNTY.

Asbestos fiber of marketable quality is reported found on the property of the Bradford Quicksilver M. Co. at San Benito.

SANTA BARBARA COUNTY.

The Union Oil Co. has closed its options on the Burton, Dutard and California Bank interests in the Santa Rita, Purissima and Jesus Maria ranches, near Lompoc, which, with other contiguous lands recently bought, aggregate 100,000 acres, and development for oil will begin this month.

The Crocker-Woolworth Bank of San Francisco, owning the Alcatraz works and pipe line, pumping oil from the Western Union oil wells near Alcatraz Landing, have bought oil lands in Santa Rita region and drilling operations are expected to begin by June 1.

SHASTA COUNTY.

Development work began this week on a group of iron mines on McCloud river, near the plant of the McCloud River Power Co., and owned by R. J. Jennings of Portland, Or. The mines are 16 miles by road from Baird Spur.

Manager W. F. Snyder of the Western Exploration Co., operating the Balaklala mine at Kennet, says forty men are at work. Ore bins are being built and in these will be stored the output of the mine, running in copper, gold and silver, pending the construction of a smelter.

C. W. Crumh of the Redding G. & C. M. Co., owning the Four mile Bar Copper, the Cadum and Gold claims, on Clear creek, near Redding, says development will be increased. A crosscut tunnel has cut the ledge, which shows values in gold, copper and silver.

SIERRA COUNTY.

Since cutting the gravel channel of the Thistle shaft (Bellevue mine), near Ghosonville, two weeks ago, Manager C. B.

Wingate says they have driven to the 5420-foot point. It will be driven 60 feet more, and then the gravel will be opened up and extraction begun. An upraise to the surface, 600 feet, will be made for timber purposes. The tunnel is 8x8 feet, and it taps the channel in the Gib-enville Ridge at the lower end of the Bellevue Co.'s holdings. Higher up the ridge this channel was formerly worked through a shaft, but a water reservoir was tapped, the influx of which forced a suspension.

At the Plumbago mine, near Alleghany, in the lower tunnel at vertical depth of 800 feet, Superintendent Mather says the ledge has been opened up, averaging 4 feet in width. Arrangements are being made to start up the 20-stamp mill, which has been idle for some time. Work has started on running an upraise, which will connect with tunnel No. 3, 800 feet below. As tunnel No. 3 is connected with No. 2 this will allow of everything in the upper levels being taken through the lower tunnel and conveyed to the mill. Mather is also manager of the Oriental mine, near the Plumbago. A tunnel is being run at this mine, which will tap the ledge at depth.

SISKIYOU COUNTY.

Operations have begun at the Greenhorn blue gravel mine, a mile south of Yreka, with J. Garvey, superintendent. Four pumps are working unwatering the shafts and tunnels, which will be retimbered. Bedrock is at depth of 100 feet from the surface.

The Las Perlas mill in the valley of the Salmon river, near Somers Bar, is running steadily, and this summer the mill will be enlarged, a cyanide plant added and electric lights put in.

TRINITY COUNTY.

The Hoedoo mine, near the Enterprise mine, on the East Fork, near Coleridge, M. Manley manager, has been bonded to the company having an option of purchase on the latter mine, says the Trinity Journal.

TUOLUMNE COUNTY.

Superintendent Melghan of the Mount Jefferson mine at Groveland has interested Boston men in the development of deep gravel mines west of Columbia, and has secured bonds on the Brady and Shine placer ground, says the Magnet. Operations were begun this week.

Work is progressing at the Mt. Jefferson mine at Groveland and more men were put to work last week. Ore is being worked from the 200-foot to the 500-foot levels. At the 500-foot, east, drifting and stopping are under way. The gasoline engine and pump in the creek are supplying water for the batteries.

The Little Boy claim, near the Taranula, near Columbia, is sold to J. Moyle. The Manhattan mine has been sold to the Yankee Hill M. Co.

Another furnace is being built and an enlargement made to the chlorination plant at the Shawmut mine, near Chinese Camp.

E. E. Trefethen has bought the Cleveland, McKinley, Hoffman and New York placers, near Sonora. J. I. Raggio has bought the Golden Annie mine on the Tuolumne river, near the mouth of Big creek.

YUBA COUNTY.

Debris Commissioner W. W. Wagner says the Government barrier work at De Guerre Point on the Yuba river, near Marysville, reports construction will resume on Barrier No. 1, and that work on No. 2 will begin during the summer.

COLORADO.

BOULDER COUNTY.

A. M. Baker has resumed operations on the Elmora tunnel in Balarat gulch, near Wall Street. The tunnel is in 740 feet, leaving 120 feet yet to drive to cut the shaft.

The United Gold Mines, Drainage & Tunnel Co. (the Cash Carroll tunnel), near Caribou, is working steadily in the tunnel and expect to put in a compressor this month.

The Valley Forge G. M. Co., operating the Valley Forge mines near Salina, report a large amount of development work done the past six weeks, and men have been at work driving the main tunnel, which has cut the Fortune lode. As soon as they are through this lode they expect to open a body of smelting ore.

Hulet & Co. are working the Summit group of claims near Boulder and driving a tunnel. The lode on which the mine is located is being opened up, showing values of \$25 per ton. The group is being worked through tunnels which will cut the different lodes at depth of from 600 to 900 feet.

The Revenge Development Co., operating on Bryan mountain, in Grand Island mining district, 3 miles from Eldora, are driving their tunnel ahead by hand until the compressor plant is set up. The company owns thirty-one lode claims and tunnel and mill sites. Water power is devel-

oped from Middle Boulder creek, above which the tunnel starts. The tunnel will be driven south 2000 feet, following the iron sulphide vein, and then turn due west and run 4000 feet. A mill and compressor plant will be built at the mouth of the tunnel. J. V. Butch is superintendent.

The Copper Ranch G. M. & M. Co., near Wall Street, propose to build a mill at their mine this summer. Drifting is under way from the second level a distance of 210 feet from the shaft. The vein is 3 feet wide. There are several streaks of iron-copper sulphide, all of which show values. The ore averages \$20 per ton, says Manager W. Rogers. The company owns 170 acres of patented land.

The United States Gold Corporation, operating the Arapahoe group, an extension of the Fourth of July group, above Eldora, are doing development work on their ground. They are driving a tunnel 1500 feet into Caribou mountain to cut their veins at depth of 500 feet. In the course of this bore several veins of ore, and also an iron dike 18 feet wide, which carries values of \$8 per ton in gold, are expected to be opened. This summer a plant of machinery will be put in at the tunnel, power for which will be furnished by water. At present they are driving by hand. The company is composed of Boulder men.

I. M. Moore, operating the Quo Vadis tunnel near Salina, has a contract to drive the tunnel an additional 200 feet to cut the Portland vein.

Hulet & Co. are working the Summit group of claims near Wallstreet and are driving the tunnel into the mountain. The lode on which the mines are located is being opened up and values of \$25 per ton are obtained. The group is being worked through tunnels which are being driven so that they will cut different lodes at a depth ranging from 600 to 900 feet.

CLEAR CREEK COUNTY.

(Special Correspondence).—H. I. See, manager the Yankee Consolidated M. & T. Co., reports a strike in one of their properties. This company owns 100 claims, and has 10,000 feet of development work done. It is understood that contracts have been let for a railroad from Central City to connect with the property of this company at Yankee.

Yankee, May 9.

The shaft on the Last Chance lode on Silver creek, near Georgetown, 185 feet deep, has been unwatered and sinking resumed. The mine has been leased and bonded to a Chicago company, J. S. Stanish, manager.

Owing chiefly to the fact that a railroad will be built from Central City to Yankee, the latter place is the scene of considerable activity, say the reports. The Cumberland mines were bonded and leased last week for \$50,000 to W. R. Strosser of Denver, Kerr and Reuter of Cincinnati, Ohio. This company has been operating mines and mills in Idaho Springs for several years. The Cumberland mines comprise eight claims on the eastern slope of Yankee hill and near the Lombard mine. Work will begin next week and the shaft will be sunk deeper, drifts being run at every 100 feet in two directions on the vein. More machinery will be added. The Bully tunnel, near Yankee, has been leased to Denver parties, who will begin work this month. The Yankee Con. Co. have a hoisting plant and machinery for their new mill on the grounds. Twenty men are on construction work. The mill will be completed June 1, says Manager H. I. Seeman, and men will then be put in the Lombard mine. The '94 M. & M. Co. will begin work on their group next week. The mill will be remodeled, and cyanide treatment used in addition to the dry concentrating table.

Work on the mill of the Elkins M. & M. Co., operating the Terrible mine, near Silver Plume, is progressing. The mill is four stories high, and 100x80 feet. Some of the jigs are in place on the lower and second floors. Its capacity will be 200 tons of ore per day. The pipe line from the large dam is being built and is expected to be finished by May 15th. The company has ten machine drills running in the mine. The drift on the Terrible lode to connect with the bottom of the Dunderburg shaft is finished, affording ventilation and opening a passageway for the ores of the latter to the mill. Driving the west drift (the Brown lode) is progressing, and a streak of silver-lead ore has been cut, which is being stored in the mill bins. The main shaft has been unwatered to the eighth level by a 6-inch column with a 1-inch air pipe down the center of the larger pipe sunk 200 feet in the shaft, the water being forced to the shaft collar by air pressure. There are seven levels yet to unwater, then the shaft will be retimbered from top to bottom. B. C. Catren is superintendent.

In Empire Tunnel, at Georgetown, an average progress of 6 feet per day was made for the month of April, advancing

the bore 144 feet in twenty-four shifts in which the drills were run in the breast. Two shifts were employed, sinking a sump near the breast, and blasting out a shooting station, and work was suspended on two different Sundays during the month. The tunnel has reached the 2200-foot mark. A large porphyry dike was cut a couple of weeks ago, also a small lode on the north side of the dike, and more water has been met with since crossing this dike.

Operations were started last week on the Argentine and Creole claims on Leavenworth mountain, near Georgetown, by the Commercial Men's M. Co., recently organized in Chicago, Ill., with F. L. Miner manager. The claims adjoin the Colorado Central-Allende group. A tunnel which was started some years ago to cut the veins at a depth of 350 feet is being retimbered and will be continued.

CUSTER COUNTY.

It is reported the Vanderbilt mine, near Custer, has been bonded and leased to W. O. Murphy, of Kansas, who will begin development work next month. The main values are in silver, but it carries some gold.

DOLORES COUNTY.

R. Batchelor has a lease and bond on the Puzzle Extension mine, up Horse gulch, near Rico, and will begin development work by June 1.

The owners of the Mediterranean group of mines, in Allyn Gulch district, near Rico, are getting ready for operations during the coming summer. The ores carry values in lead and zinc.

G. A. Sanborn has a lease and bond on the Finis lode, also a lease and bond on the Minnie May mine, near Rico, and will work both properties this summer.

EAGLE COUNTY.

A. S. Little & Co., lessees on the Black Tiger mine, across the river from the California mine, in Eagle River canyon, near Red Cliff, are taking out ore which gives returns in copper, gold and silver. More men were put on last week. On another part of the Tiger, J. Johnson, who has a lease on the lower tunnel, is in good ore and has ten tons ready for shipment.

R. McMillan and L. Mathias, who have been leasing on the Red Cap, another canyon mine, were forced last week to abandon the mine on account of surface water, and a couple of days later secured a lease on the Alleghany, on South Battle mountain, and have since opened up ore.

FREMONT COUNTY.

The Ocean Wave coal mine at Williamsburg has been sold to the Rocky Mountain Fuel Co. at Denver for \$50,000. Included in the deal is 120 acres of coal land, bearing two strata of coal; a developed mine with a capacity of 200 tons a day, and all equipments. S. P. Smith, Jr., is superintendent. He still has charge of the Peanut mine at Williamsburg, and is sinking an air shaft on the edge of the town for better ventilation. Later the coal from the mine will be hoisted through this air shaft.

The United R. & R. Co., of Florence and Colorado Springs, are taking some of the machinery from the Metallic mine, near Florence, to Canon City, where it will be used in the construction of the smelter being built there by this company. A 3-inch vein of silver and gold ore is being developed near Grape creek in the Rocky Mountain Boy mine. Chicago men are interested and F. L. Pond is superintendent. The mine property is near the Green Mountain Boy and El Plomo claims.

The Portland Cement Co. near Florence are removing the kilns from the old mill to the new kiln room where they will be placed on concrete piers and run in connection with the four kilns in operation there, making six in all. The company intends converting the old mill department into a plaster of Paris factory.

GILPIN COUNTY.

Bad air has caused a suspension of operations in the breast of the Perigo tunnel at Perigo during the past week, says the Register-Call, but other operations continue, with sixty men on the contracting, day's pay and leasing systems. The Perigo mill is running steadily and is crushing 100 tons of ore per day. The Northwestern Colorado Exploration Co. has suspended operations at its Benton group on War Eagle hill, near Perigo, on account of the amount of water which the mine is making. The machinery has been found inadequate for present purposes and heavier pumps will be put in.

At the Freedom mine, near Central City, the Colorado-Tellurium G. M. Co. is retimbering the shaft from top to bottom. As soon as it is unwatered and the repairing finished it is intended to sink from present depth of 822 feet down to 1200 feet, where they are equipped for that depth. R. Borchardt is superintendent.

Operations have been delayed at the Snowden Con. group in Pine Creek sec-

tion, near Central City, on account of the bad condition of the roads. The owners have 150 tons of smelting ores in their ore bins ready to ship to the smelters.

The Belden mine in Chase gulch, near Central City, is being unwatered. Eastern parties are interested, and since taking hold last fall they have repaired and retimbered the shaft to depth of 400 feet. Below the 400-foot point the shaft has good walls.

Arrangements are being made for the starting up of the Pleasant View group on Gunnell hill, near Central City, and a steam plant has been put in. The property is owned by E. Reser of New York City, J. J. Joslin of Denver, et al.

GUNNISON COUNTY.

The Ruby-Anthracte coal mines, near Crested Butte, have resumed and expect to begin shipping coal next week.

HINSDALE COUNTY.

(Special Correspondence).—Creel Bros., who have a bond and lease on the Excelsior mine at Capital City have opened up a body of ore in a winze 90 feet below the tunnel level and have a shipment ready. The ore is a sulphide carrying values in silver, lead and copper, with an excess of iron, and averages \$50 per ton. The Golden Fleece will resume work next week in their crosscut tunnel. The mill is being overhauled preparatory to reworking the tailings. A number of lessees are working in the upper levels. Somerich pockets of tellurides are found. The Pelican group, up Henson creek near Lake City, which is under bond and lease to a Boston company, has men at work on development. Some ore is being saved, a streak 14 inches wide showing in the breast which assays \$55. J. D. Kaysar is superintendent. The Hanna M. Co., owners of the Moro and Ajax claims near Capital City, expect to put on forty men next week. The mill will be remodeled, and magnetic separators put in. This ore is heavy in zinc, which has caused excessive treatment charges at the smelters, and prevented shipping of concentrates. It is reported the Yellow Medicine mine at Capitol City will resume, and the mill which was built in sections moved down near the creek, making it more accessible to the lower tunnel. The North Star, above Lake City, under bond to Cochran, Barrett & Patterson, report a body of galena and they are getting a carload ready to ship. The snow is still 2 feet deep in Burrows Park, so there is no prospecting being done yet in that section. Several mines, however, are doing development work, including the Bon Homme, Dupre and Pennsylvania.

Lake City, May 19.

LAKE COUNTY.

During the past year Leadville has shipped in actual tonnage of zinc sulphides 85,699 tons, which yielded \$2,000,000. During the same time Leadville's output of lead ores has been \$1,500,000, a curious economic change resulting from the advances in milling practice, says the News-Dispatch.

A larger pump has been put in at the Coronado mine at Leadville on the 600-foot station. This pump has a capacity of 1000 gallons for 1000 feet.

The Brazil M. Co. has incorporated at Denver; T. R. Woodrow, J. W. Jackson and W. R. Milburn and Berger Bros., to operate near Leadville and also in Wyoming.

LA PLATA COUNTY.

The Animas river will be used as initial power for generating electricity to be distributed over a large area of the San Juan country. A company has organized for this purpose and the building of the first plant will be begun near the Baker bridge, 15 miles north of Durango, this month. Other plants will be erected from time to time farther up the river. The fall of the river from Silverton in a distance of 44 miles to Durango is 3000 feet, and its volume varies. Overtures have been made by the company for the purchase of the plant of the Durango Light & Power Co., says the Gazette.

MINERAL COUNTY.

W. G. Boyle, F. Nash and R. B. Wallace, of Creede, have a 1000-foot contract to drive the F. M. B. tunnel near Creede that distance. F. Nash, superintendent, has fourteen miners and machine men at work.

SAN JUAN COUNTY.

T. J. Hurley, superintendent of the Natalie Occidental group, near Silverton, says the Magnolia vein has been opened up, showing 14 feet between walls and carrying average values of \$9 per ton in gold, copper, lead and silver. It has been decided to put up a mill during the coming summer.

All sales on the New York - Brooklyn group, near Silverton, are declared off by the owners and the mining of ore and further development will be done this year by Manion Bros. & Murphy. T. Manion, manager, has been given a lease

on the Johnson mill at Burro Bridge, North Mineral, for experimental purposes on the lower grade ores of the mine. Shipments of the richer gold ore will begin as soon as the Red Mountain railroad is opened up.

D. Heindel and D. Pettyjohn have begun work on their Mszepa group of four claims in Ice Lake basin, near Silverton. The ore is a lead sulphide and gives returns of thirty-four ounces silver, a little gold and 20% lead.

The Fisher mill and millsite and the Eveline group of five claims near Silverton, of the Eveline M. Co., of Denver, have been sold to the Venetian M. Co., of Chicago, Ill., for \$15,500. The main purpose of the Venetian Co. was to secure the water right on Cement creek and to obtain deep entry to Peacock veins on Peacock mountain through a drive along the Eveline vein. The mouth of this tunnel is near Henrietta switch on the Gladstone railroad. For the present, ore will be hauled to the Fisher mill. It is expected the mill will be moved to near the tunnel, and enlarged.

SOUTH ARAPAHOE COUNTY.

(Special Correspondence).—For the past eighteen months some of the leading oil operators of Colorado have been investigating the oil possibilities of Bijou Basin, near Deer Trail and Byers, 50 miles east of Denver. Indications of oil and gas have been found in artesian wells. The territory is perhaps 50 miles in length by 10 to 15 miles in width. A Peoria, Ill., company are building a derrick and will begin drilling at Peoria, half way between Byers and Deer Trail.

Peoria, May 9.

SUMMIT COUNTY.

The placer mining season has opened around Breckenridge. All the larger placer properties, the Oro Grande, American, Gold Pan and French Gulch, have begun washing gravel. The Oro Grande's 11-mile ditch has been cleaned of snow, ice and debris, and Manager Harris has started work with both elevators. Manager G. H. Evans of the Gold Pan has started the elevators on the company's placers. The elevators are draining the pit and washing of gravel will begin by next week.

TELLER COUNTY.

The Fort Pitt Co., operating on the Sunshine claim on Galena hill, near Cripple Creek, has straightened, enlarged and retimbered the shaft, and the shaft will be sunk on the vein an additional 100 feet before drifts are run out on the ore body. Sinking has been resumed by the South End Leasing Co., operating on the south end of Burns' claim of the Acacia M. Co., at Cripple Creek, the company having stope out the ground between the surface and the bottom level at depth of 80 feet.

Kinzy & Co., operating the Sitting Bull claim of the Keystone Co under lease, have secured the Pannick claim of the same company and adjoining the Sitting Bull claim near Cripple Creek. The lessees evidently think that the ore shoot will extend over into that property. It is intended to put a plant of machinery on the Pannick and start development this month. Shipments of ore are being maintained from the Sitting Bull.

With the opening of the Rocky Mountain mine, on Beacon hill, Cripple Creek, everything on the west slope of that hill is working. The Rocky Mountain Co. has leased the group for two years at a flat royalty of 20% to A. C. Adams. The shaft is to be sunk an additional 100 feet and it is his intention to put in a plant of machinery, including an air compressor. The shaft is down 200 feet.

Sinking continues on the middle block of the Deadshot, on Rosebud hill, Cripple Creek, and O. H. Satterlee, lessee, is down 80 feet. When 100 feet is reached a steam hoist will be put in. C. Perkins, operating under lease the Compromise Fraction and the Deadwood claims, is installing a steam plant of machinery.

At Victor the Economic reduction plant in Aregua gulch is handling 200 tons daily, the ore coming mainly from mines owned by the Woods Investment Co., which also owns a controlling interest in the Economic mill. Pot Gulch district, 4 miles south of Victor, is reviving, says the Telegraph. New York men have erected a plant of machinery and development is being done at depth of 300 feet. A cross-cut is being driven on a vein of quartz 40 feet wide, which returns average values of \$5 per ton in gold, says Manager Degnon, of New York.

The holdings of the Cripple Creek & Colorado Co., (the Rittenhouse) on Gold hill, Cripple Creek, are being leased out by Manager O. B. Finn. A lease on the north 400 feet of the White Elephant claim, from the surface down to the depth of 300 feet, to J. C. McSparrin; north block of the Happy Day claim to C. Johnson from surface down to depth of 300 feet; R. G. Mullen south half of the White

Elephant claim. All the leases are for eighteen months and flat royalty of 25% on all ore shipped. The property is equipped with a plant of machinery and the shaft is down 800 feet.

Another ore shoot has been added to the system of ore shoots of the El Paso Con. Co. at Cripple Creek, says the Cripple Creek Times. The shoot was found toward the eastern part of their ground and was cut while driving the level toward the water course. With this find the El Paso Co. claims to have seven separate and distinct ore shoots. The production from the mine during April amounted to 1073 tons of the usual grade of ore. In the first level of the new shaft at depths of 190 feet and 220 feet below the surface they have opened the extension of the C. K. & N. vein, the ore showing 4 feet in width and averaging \$40 per ton in gold. The company has finished setting up another battery of boilers. The water is being controlled—that is, as far as the company cares to handle it at the present time.

The ten sets of lessees operating on the mines of the Work Co. at Cripple Creek, both on Raven and Gold hills, are shipping an average of 125 tons of ore each month, all of which will average \$20 per ton in gold.

The total production from the Vindicator mine at Victor for April was 1500 tons of an average grade of \$35.

The tramway at the Portland mine at Cripple Creek is in operation, carrying waste rock from No. 2 shaft to the dumping area on the west side of the mine. The tramway works automatically in disposing of the rock and is driven by an electric motor. Its length is 800 feet.

The Practical Leasing Co., operating on the Trachyte of the United G. M. Co., produced 800 tons of ore during April, of a value of \$30 a ton. The output would have been heavier but for the large amount of dead work done during the month.

The Cripple Creek M. Co., leasing on the Hull City Placer main workings, is shipping two cars per day, averaging \$40 a ton. The shaft is down to the 1250-foot point and the station is being cut, after which a crosscut will be run to the ore body.

The output from the Golden Cycle last month totaled 3700 tons, of which lessees Dalzell & Wilson shipped 600 tons and the rest was mined on company account. The value of the output was \$25 a ton.

IDAHO.

BLAINE COUNTY.

The Minnie Moore M. Co., near Hailey, has resumed regular shipments of ore from its mine.

BOISE COUNTY.

The Idaho World says the Lincoln mill at Pearl and the Overlook mill at Neal will be compelled to shut down because of a clause in the "pure food law" enacted by the last Legislature which prohibits the sale of oil and gasoline less than 150° proof. Both these mills have gasoline engines, and gasoline used for power purposes is less than 72° proof.

IDAHO COUNTY.

J. B. Eldridge of Topeka, Kans., has bought the Waterhouse & Churchill group of three claims on Smith creek in Thunder mountain district, near Roosevelt, for \$3000. The claims adjoin the group owned by the Kansas & Texas Oil Co., of which Eldridge is manager. They also own the Independence group in the same district, on which work has been in progress all winter. As soon as sufficient ore is stope and blocked out a cyanide plant will be put up.

C. L. Hathaway says he will have fifty men at work on his placer ground on Grouse creek, near Council (Washington county), this season.

OWYHEE COUNTY.

Manager Gerling of the Homestake group, near Silver City, says next week they will begin running a tunnel to crosscut the ledge at a depth of 300 feet. The tunnel will be 400 feet long.

SHOSHONE COUNTY.

The New Jersey G. M. Co. will build a 10-stamp mill, electric lighting plant and a tramway this summer, construction work beginning June 1. It is the intention of the company to increase the plant to forty stamps if the present mill proves satisfactory. The mines of the New Jersey G. M. Co. are 3 miles east of Wardner, between Gold Run and Big creek, on the line of the O. R. & N., says J. H. Tilley of Spokane, Wash., a director. The company is completing a flume 8300 feet long, which will bring water for running the mill.

Manager Goodrich of the Highland Chief mine, on Pine creek, near Wallace, says the company will put up a sawmill and a four-drill air compressor, the sawmill to cut timber for the flume which will have to be built. These improve-

ments are preliminary to putting up a concentrator.

D. M. Hyman, manager of a group of mines at Aspen, Colo., says operations will be resumed at the mines of the Gem Con. M. Co., near Wallace, of which he is also manager. These mines have been closed down and concentrator hung up since last fall.

Savage & Chrysler, principal owners of a placer group extending the entire length of Beaver creek, near Wallace, will build two dredgers on their grounds this season. Two dredgers are already in operation. The first work this season will be done on dredger No. 3, the estimated cost being \$65,000. The first two floats cost \$45,000 each, but the third is to be larger. Lumber for No. 4 is on the ground.

Spring placer operations have started around Pierce. The Rich Hill Co. began piping last week. It is expected the pumping plant will be on the ground and ready to run by June 10th.—L. C. Roberts, manager of the Musselshell group, has men at work. He says it will take \$25,000 to open up and equip their placer property ready for operation.—The Fidelity Co. on French creek is working fourteen men, running two giants.—Several quartz mines that were shut down for the winter are starting up.

WASHINGTON COUNTY.

Manager G. W. McDowell of the Con. Copper M. Co., operating at Mineral, reports making a strike in the tunnel which is being driven. The ledge shows 42 feet wide and carries values in silver and copper. He has sixty-five men at work and two machine drills in operation. They have an eight-drill air compressor. The smelter has been overhauled, but will not be put in operation until July 1, as Manager McDowell says he does not expect to stope out ore until then.

MICHIGAN.

The lake and rail rate on refined copper from lake ports to New York is 23 cents per 100 pounds, as compared with the all-rail rate of 41½ cents.

HOUGHTON COUNTY.

The work of sinking a shaft began this week at the Globe mine, near Houghton, on the lode found by experimental drilling last summer, says the News.

The April product of the Franklin mine, near Hancock, amounted to 361 tons as compared with 317 tons for April, 1902.

The new Hecla mill, near Calumet, is running all five heads of stamps electrically. Lake advices say that Calumet & Hecla copper is costing 8 cents a pound and sales have recently been made at 15½ cents. They are stamping 6000 tons of rock per day, from which, comparing with last year's figures of production in refined copper, the yield is forty-five pounds of mineral per ton stamped. It is only a few years since the yield was sixty pounds. The mine is shipping more rock than at any previous period, which is made possible by the recent improvements in the hoisting equipment.

The April product of the Adventure mine, near Redridge, amounted to 181 tons.

It is reported that a plan is on foot by President Fay and members of the Union Land & M. Co. for the organization of a new company which shall take the northern portion of the Seneca group and 400 acres of the Union Copper Land & M. Co. property immediately north thereof, near Houghton.

Rock shipments from the Cbamption show a gradual increase, and now aggregate 1400 tons daily. The milling plant is saving a mineral yield of forty barrels of fine copper per day.

MONTANA.

BEAVERHEAD COUNTY.

Superintendent O. Mast says foundations are being made for the smelter at the Indian Queen mine, on Birch creek, near Dillon, which is owned by Butte men. The smelter will have a capacity of thirty tons daily.

CASCADE COUNTY.

D. M. Sutton of Helena says a new gold field has been discovered 7 miles south of Belt and near the coal camp. The ores are similar to those of Kendall district and can be treated by cyanide.

CHOTEAU COUNTY.

E. W. King at Landusky is having a mill put up at his mine, and he expects to have it in operation by July 1.

FERGUS COUNTY.

The Mountain King, Big Pine, Broken Leg and North Pole claims, north of and adjacent to the Abbey group, near Kendall, have been bonded to the Case-Wilson Cyanide G. M. Co. of Trenton, N. J., for \$40,000.

C. A. Case has bonded the Big Chicago claim in Cone Butte district, near Lewiston. Several hundred dollars worth of development work has been done on the

property, a great deal of it by parties who have attempted to jump the claim, says the Argus. There is a 60-foot shaft and a 20-foot crosscut all in ore which assays \$10, and can be treated by cyanide.

At the Drake mine of the Gold Reef group in Gilt Edge, instead of one roaster as originally decided upon, two are to be put in and work on them is being rapidly rushed. They will have a roasting capacity of 300 tons daily. A mill is also to be put up on the dump and the tailings will be worked over.

GRANITE COUNTY.

Manager F. D. Brown says operations have resumed at the Basin Gulch placer mines and he has seventeen men at work. The indications are that there will be a good supply of water for placer mining purposes this summer.

D. Conklin, superintendent of the Billy Maddox mine at Royal, says owing to snow in that section and the difficulty of obtaining supplies work has been practically suspended temporarily at the mine. The roads are in bad condition and will probably be for the next two weeks.

JEFFERSON COUNTY.

The new feature about the Heinze mill at Basin is the flume built to remove the tailings from the mill to the dumping ground. The tailings had piled up in the creek to such an extent that it not only annoyed the ranchers of Boulder valley, but also proved an inconvenience to the company. The plan is to dump the slimes and retain them in the dam built for that purpose, and so avoid running the tailings down the stream and through ranches in the valley, where there is danger to the growth of vegetation and the poisoning of stock. The company in order to avoid any trouble with the ranchers, has built a dam east of the mill to stop the flow beyond the company property and will build it higher as occasion demands.

M. L. Hewitt, manager of the Cateract C. M. Co. at Basin, says he has put on more men at the Bullion mine to further develop the property, and will also put in additional machinery.

The Bertha mine at Corbin is being developed by the Helena & Livingston M. & R. Co.—The Tyler group of claims, 2 miles from Montana City, has been bonded to Jones & Martin of Great Falls for \$100,000, and men have been put on development work.—The Liverpool and Washington mines in Lumpguch, near Boulder, are to be tested to see if the high-grade silver ore bodies of that district go down, and the shaft will be sunk to the 800 level, where they will crosscut to the lead.—The Rose G. M. Co., incorporated under New Jersey laws, has filed in the office of the Secretary of the State a certified copy of its articles of appointment of an agent in Montana, the agent being B. F. Maiden of Bozeman. The company owns eight mining claims and two millsites in this county. B. P. Mason began work on the Virginia Bell group last week above the Boulder-Wickes tunnel, 6 miles north of Boulder.

LEWIS AND CLARKE COUNTY.

Plans are being prepared for a stamp mill and cyanide plant for the Plegan mine, near Marysville. The plant will be similar to that of the Belmont mine, owned by the Longmads, and the tailings will be treated before leaving the mill. Development work on the Plegan progresses and the plant will be built at the mouth of the main tunnel.

MISSOULA COUNTY.

Negotiations are reported in progress in Copper Cliff district by F. T. Homer and W. B. Tilden of Baltimore, Md., for the bonding of the Copper Cliff mine. The Copper Cliff district is 25 miles east of Missoula. Copper values have been found by prospectors and also ores that run in both gold and silver.

NEVADA.

HUMBOLDT COUNTY.

B. F. Caffey et al. have bought the Black Bird mine, near Winnemucca, for \$20,000, renaming it the Bluejay. The vein carries average values of \$12 per ton in gold. A. Garr is superintendent.

The smelter of the Glasgow & Western Exploration Co. at Golconda is expected to blow in again next week.

LINCOLN COUNTY.

At Bamberger's DeLamar mines the mill is expected to be in operation this week. The plant by which 2800 H. P. is to be supplied the mines and mill was given a preliminary run last week. Superintendent Janney has 100 men at work underground.

NYE COUNTY.

Sinking began last week on the Ordah-Tonopah group of seven claims southwest of the Tonopah Central and 1½ miles south of Tonopah, says Manager Watson. A hoist will be put in.

At the Mizpah at Tonopah the west drift on the 600 level is in 140 feet and in

a body of ore. Winzes are being sunk every 250 feet from the 300-foot level to connect with the 400-foot and 500-foot levels, and the 400-foot level is being extended to connect with the winzes. In the east 300-foot level, 900 feet from the Slebert shaft and 300 feet from the east end of the Mizpah, a winze is being sunk on the ledge and is down 60 feet. This ledge is 80 feet wide and averages \$40 a ton.

J. C. Gladden last week bought seven claims adjoining the Lynch & O'Meara group at Alpine, near Tonopah, and C. E. Hudson, F. Lathrap, J. W. Langley and M. L. Eflinger of Salt Lake City, Utah, and A. L. Hudgins of Tonopah have incorporated to develop the group. Work will begin next week. A shaft will be sunk within 400 feet of the present workings of the Lynch & O'Meara.

The Tonopah-Albamarle M. Co. began development work this week. Its property consists of twelve claims on the eastern base of Mount Oddie, between the Mizpah Extension and the Butte-Tonopah Co.'s mines, near Tonopah.

Foundations are being made east of the Midway hoist for the 10-stamp mill of the Tonopah M., M. & D. Co. at Tonopah.

STOREY COUNTY.

The Butters Co. has amoled the Hale & Norcross waste dumps at Virginia City, which will be hauled to the cyanide plant in Six Mile canyon.

Manager J. Ryan's report for the week ending May 9 says the work of repairing and overhauling the engine and hoisting machinery continues at the Con. California & Virginia at Virginia City. The south drift on the 1800-foot level is repaired, but no work is being done on other levels. The pumps are holding the water below the 2150-foot level. The Hale & Norcross tunnel was advanced 17 feet, total length 3639 feet. The face is in hard porphyry with a strong seepage of water. At the Utah the work of installing the electric hoist is completed and awaiting connection with the Truckee River General Electric Co.'s line. Some changes and repairs have been made to the machinery of the drill plant at the Occidental mine, and drill hole No. 4 will be started next week. At the Silver Hill they took out during the week 117 cars of ore from different parts of the mine, samples assaying \$17.57 in gold and two ounces silver. A 1 H. P. motor has been put in on the 200 foot level for running a blower. On May 4 men began to work eight-hour shifts in the Overman and Caledonia mines.

WASHOE COUNTY.

The Wedekind mill, near Reno, which has been idle since February, started up this week on Tonopah ore.

The Cabin No. 2 mine, the V mine and the Wadsworth mill, in Olinghouse canyon, near Wadsworth, have been sold to New York men, says the Wadsworth Dispatch. It is thought the Slip mine and mill and the Renegade mine may be included in the deal.

WHITE PINE COUNTY.

The Old Imperial M. Co. at Cherry Creek are building a mill at their mines, says the Cherry Creek Miner.

Superintendent Leishman of the Wide West M. Co. says a body of free gold ore has been opened up on the 150-foot level of the Wide West mine in Gold Canyon district, near Cherry Creek.

NEW MEXICO.

OTERO COUNTY.

At Jarilla the Jarilla C. Co. are working on the 300-foot level and taking out ore. The Orion Co. are driving a crosscut through its 30-foot ledge.

SIERRA COUNTY.

W. S. Henderson of Colorado Springs, Colo., has bonded the Grand Central mine, near Lake valley, and will begin development work this month. A sawmill will be put up at the mine and a wagon road built to Lake valley. The mine contains a body of ore with values in lead, silver and zinc.

OREGON.

BAKER COUNTY.

Excavations are under way for the 10-stamp mill for the Octo mine, near Sumpter, says Manager Patterson. The sawmill is in operation and development work in the mine continues.

Manager W. L. Vinson of the Emma mine, near Baker, has put in a 12 H. P. hoist and a 16 H. P. engine for his mill. The hoist is put in the tunnel 300 feet from the portal and at a point where the ore is showing best, it being intended to sink on this ore body.

Superintendent D. McCoy has twenty men at work on the Olive Creek placers, near Baker. He is operating three giants, the two larger ones being in Three Cent, where the gravel bank has a depth of 30 feet, while the No. 2 is in the main chan-

nel of the Olive, where the depth is 6 feet.

J. R. Cunningham of the Advance and Storm King companies, near Sumpter, says the ore is showing the full width of the shaft in the bottom at the Storm King, and a concentrating mill will be built.

J. Waddell, operating the Cyclone mine near Baker City, has put in a 25 H. P. gasoline hoist for sinking from the tunnel. The tunnel is in 200 feet, but there are other workings on the property proving the vein.

Manager A. Mohr says work was resumed last week on the St. Joe mine, near Sumpter—putting two shifts in the cross-cut tunnel which is being driven to cut the Jack Pot vein, which it is expected to reach 40 feet ahead.

GRANT COUNTY.

J. W. Burch, part owner of the Independence group, near Granite, has let a contract to G. J. Barrett for driving 400 feet of tunnel.

Work on the Scandia tunnel, near Alamo, continues steadily, says B. Wade, superintendent, and 2250 feet is in.

JOSEPHINE COUNTY.

The Kramer-Palmer quartz mill on Mt. Reuben, near Grant's Pass, is in operation. The mill is of four stamps, run by water power, and the ore free-milling. An impounding dam has been constructed to catch the tailings. The mine is on the Rogue river side of Mt. Reuben, near the mouth of Whiskey creek.

WALLOWA COUNTY.

Manager G. A. Nebrhood of the Imnaha smelter, being built by the Eureka M. & S. Co. at Imnaha, says he has fifty men at work. All machinery for the 300-ton plant was shipped via Lewiston, from which point it is being transported by steamer on the Snake river to the smelter on the Imnaha river, near its junction with the Snake. Mr. Nebrhood says development work in the mines of the company have reached that point where an output of 200 tons a day is assured. Five tunnels have been driven, each an average distance of 200 feet, opening up a body of copper sulphide with depth. On one of these, the Mountain Chief, the vein with smelting ore is 9 feet wide. The steep banks of the Snake and Imnaha where the copper is found afford splendid tunnel propositions, and the Eureka Co. is able to drive on its veins from both the Imnaha and Snake sides of the divide. Water for power is obtained from the Imnaha. It is expected the Eureka smelter will be finished by Sept. 1.

SOUTH DAKOTA.

LAWRENCE COUNTY.

President Pratt of the Wauconda M. Co. has a bond on a group of mines on Elk creek, 5 miles south of Lead. There are 450 acres in the group, and it is to sell for \$250 an acre. The group is between the Wauconda and Anaconda groups, and includes the water right of the Hall ranch on Elk creek.

The Anaconda G. M. Co. have put in machinery at the shaft near Elk creek, and sinking is resumed in the shaft. The ore is free milling.

UTAH.

BEAVER COUNTY.

Manager P. T. Farnsworth of the Horn Silver mine, near Frisco, says a 200-ton shipment of zinc ore is being made from that property to Antwerp, Belgium. It is the initial shipment from the State. The ore carries 40% zinc and it is estimated there are 300,000 tons of it in the old workings. It is a trial shipment.

Secretary L. G. Brown of the Erie mine, near Millford, says the company has put in a 22 H. P. gasoline hoist at the mine. The main shaft is down 261 feet and has cut through 60 feet of red oxide and native copper. The ore shows small values in gold and lead. Contracts have been let for sinking the main working shaft 50 feet deeper and also to run a drift from the 250-foot station.

President F. Sugden of the Blue Jay Extension Co., operating in Indian Peak district, near Millford, says a gasoline hoist will be put in.

IRON COUNTY.

Denver, Colo., and New York men have an option on the Rice group of claims, north of the Johnny mine, at Stateline, for \$30,000 for two years. W. F. Baker, of Denver, Colo., manager, says a double-compartment shaft will be sunk and machinery put in. The Rice group consists of eight claims.

JUAB COUNTY.

A shoot of ore was cut 65 feet below the 1000-foot level in the Lower Mammoth shaft at Eureka last week. The ore sampled showed assays of sixty ounces silver. The shaft is going down at the rate of 4 feet a day, and is 10 feet below the 1000-foot level. This shoot will not be pro-

spected till drifts are run from the 1200-foot point.

The Fairview group of claims, between the Ajax and the Victor and adjoining both properties, is to be incorporated next month, and developed through the Sioux-Ajax tunnel, a drift from which will cut the ore zone 1100 feet from the surface, says Manager E. O'Brien, of Mammoth. J. O'Brien and H. Kelly, of Scranton, Pa., are part owners.

Two shifts are at work on the ground of the McKinley M. Co., near Eureka, with J. L. Anderson as superintendent. The ground is northwest of and adjoining the Centennial-Eureka. The 250 foot tunnel will be extended another 200 feet to tap an ore body which was opened up in a shaft above.

MILLARD COUNTY.

The Ozark Gravel G. M. Co. has incorporated at Desert; A. Campbell, J. M. Evans, T. M. Evans, F. E. Hoagland and L. Van Hecke, says the Desert News.

SALT LAKE COUNTY.

To supply the needs of the valley smelters during April the producers furnished 97,234 tons of ore, while it is estimated 20,000 tons were forwarded to plants of the American S. & R. Co. outside the State. While bad roads in the gulches and between the mines and the leading stations along the railway curtailed the actual amount of ore forwarded from the diggings somewhat, the smelters had, of course, their bins, in which is always contained a surplus on which to rely, and the run was continuous throughout the month. It is expected the May reduction will exceed 100,000 tons.

SANPETE COUNTY.

C. C. Parker of Eureka, manager of the New York M. Co., is putting up a mill at the company mine west of Ephraim.

SEVIER COUNTY.

S. F. Mount and L. Nielson are reopening the L. & N. mine near Richfield, which Mount has under bond and lease.

SUMMIT COUNTY.

The Portland-Park M. Co. has been organized at Park City: M. C. Harrington, J. H. Steele, M. Sommer, A. H. Fuelling, J. V. Murphy, M. L. Garity, W. Wirthlin.

Operations will begin this month on the mill to be built by the Kearns-Keith Co. at Park City. The plant will be at the mouth of the Hanauer tunnel, through which the Kearns-Keith and the Keystone mines are to be worked, says the Record.

Two additional rolls have been put in at the zinc plant at Park City.

The Ingersoll group at Park City was sold last week to J. Mortz and M. Cullen of Salt Lake City, and development work will be started next week.

R. Gorlinski has a lease and bond on the St. Louis-Vasser ground in Snake Creek district, near Park City, for \$80,000. It is intended to put in additional machinery.

TOOELE COUNTY.

A battery of three retorts with which to treat the mercurial ores of the Sacramento M. Co., at Mercur, is being built and the production of quicksilver will begin June 1st, says Manager Bothwell. J. H. Magee will be superintendent. The rock has maintained an average of 10% mercury with \$8 gold per ton, says Bothwell, the principle being to collect the former through volatilization and to leach the gold from the residue as is done with the main gold-bearing ores. The production of quicksilver has been accomplished at Mercur before, but never on a commercial scale.

UTAH COUNTY.

C. W. Earl, W. H. Greenwood et al., have bonded and leased the Whirlwind group of five claims near American Fork. This group adjoins the Dutchman mine on the west and the Goodsell and Pacific on the south.

WASHINGTON.

CHELAN COUNTY.

T. S. Burgoyne of Spokane, part owner of the Horseshoe Basin M. & Dev. Co., which owns five claims in Horseshoe basin in Stehekin mining district, 25 miles from the head of Lake Chelan, says a number of open cuts have been driven on the ledge. They are also driving a tunnel and must go 300 feet farther before the ledge is struck, which will be tapped at depth of 500 feet. The ledge is 4 feet wide and carries gold, silver and lead values. The company will put in electric drills. There are no other claims working in the district, says Burgoyne. The Cascade G. & C. M. Co. of Ashland, Ohio, owns claims adjoining the Horseshoe on the same ledge.

FERRY COUNTY.

Superintendent W. G. Madison of the Bodie mine, near Republic, says he is putting in a gasoline engine and blower. The Trade Dollar mine has put men to work

stopping ore for shipment to the Tacoma smelter.

Work has resumed on the Washington mine, near Hall's bridge, 7 miles north of Orient. F. Ward and C. E. Brooks are the principal owners.

D. F. Anderson of Rosalia, manager of the Belcher mine, near Republic, says the tunnel has cut the ledge for 31 feet and has not yet reached the foot wall. The ore assays \$30, chiefly in gold. He says there is a large amount of ore on the dump and shipping will begin July 1. The mine is 7 miles from the railroad, but has a good wagon road.

KING COUNTY.

The Renton Coal Co., whose mines are 5 miles from Seattle, report iron sulphides in their coal which assay \$7 in gold.

WYOMING.

CARBON COUNTY.

A strike is reported from Big Creek district, near Saratoga, by the Gibraltar M. Co. in its group near the Cox mine. A 4-foot vein of covellite has been opened up at depth of 160 feet.

FOREIGN.

BRITISH COLUMBIA.

The annual report of Manager J. H. Mackenzie of Le Roi No 2 Co. at Rossland shows the sales of matte amounted to \$385,521. The mine was operated only 263 days. The ore mined and shipped to the Northport smelter was 155,765 dry tons, averaging .363 of an ounce of gold; .709 of an ounce of silver and 1.526% copper. The cost of mining and smelting was reduced during the year, although a large amount paid for exploration work was charged in the accounts. The costs per ton for 1901 and 1902 are shown in the following table:

	1901.	1902
Stopping and loading on railroad.....	\$ 3.487	\$ 3.100
Exploration.....	.423	.451
Deoreclation:		
Mine equipment.....	.080	.138
Surface improvements..	.050	.061
Mine machinery.....	.106	.125
Freight on ore to smelter.	.510	.400
Smelter expense.....	4.465	4.205
Depreciated smelter plant.	.232	.119
Interest and discount on ore in yard and matte in transit.....	.229	.233
Freight on matte to refiners.....	.536	.404
Sacking and crushing matte.....	.044	.043
Eastern representation, assaying, etc.028	.013
Refiners' tolls and deductions.....	.534	.579
Metal losses in smelting...781
Total.....	\$10.724	\$10.652

The total development work done during the year was 3123 feet. The cost of shaft sinking per lineal foot was \$106.99; of crosscutting, \$ 8.92, and of drifting, \$16.95. The expenditures as reported by the manager include \$487,010 for mining ore and \$106,887 for construction, development and additions to mining machinery and plant.

There are 1000 men at work at the coal mines of the Crow's Nest Pass Coal Co., at Michel. The rock for the new coke ovens at Michel is being brought from the quarry at the rate of seven cars per day and construction work has begun.

Manager A. Banks of a company operating on Perry creek, near Fort Steele, says the placer mining season in that district is well under way.—The Kootenay Perry Creek M. Co. have bought a tract of gold-bearing gravel on Perry creek suitable for dredging, and have their machine in operation.

The Nanaimo quarries, from which the stone for the San Francisco Mint was cut thirty years ago, and have since been idle, will be reopened, says Manager Emery, under a lease from the Western Fuel Co. of San Francisco. Stone is wanted for building purposes in all the coast cities. Hundreds of men will be employed and a fleet of vessels engaged.

W. H. Tibbals of Salt Lake City, Utah, has an option on a group of claims near Greenwood, for \$135,000.

At Trail three copper furnaces are running, with an ample supply of coke and ore. None of the lead stacks have been blown in. The supply of lead ores is as yet light.

The miners in Dunsmuir's Cumberland coal mines, on Vancouver island, struck on the 4th inst., because several union leaders were discharged. The real issue is the recognition of the Western Federation of Miners. It is thought the Cumberland mines will not be closed down absolutely, as the Extension mines have been, but an attempt will be made to work them with Chinese, Japanese and non-union men. If effective, the strike will cut off the fuel supply of the Canadian

Pacific Railway, leaving the Nanaimo mines the only producers on the island. The double strike at Extension and Cumberland affects 2000 men.

Several changes have been made in the tariff laws of Canada, one provision in particular which is of importance to Cariboo miners: "That machinery and appliances, of a kind not made in Canada, for exclusive use in alluvial gold mining, be added to the free list until June 30, 1904."

The Spitzee mine, near Rossland, has resumed. A contract will be let for 100 feet of sinking on the site selected for the new headworks and compressor plant. The new main shaft will be two-compartment, sunk at an angle of 70°. At the 100-foot level a drift will be driven north to connect with the old workings.

In Boundary district connection was made last week between No. 3 tunnel and the 100-foot level on the old Ironsides mine near Greenwood. This tunnel is on line with and will ultimately be connected with the 200-foot level of the Knob Hill mine. The Snowshoe mine began shipments this week.

The second furnace at the B. C. Copper Co. smelter, Greenwood, was blown in this week, notwithstanding that coke is not yet coming sufficiently freely to keep both furnaces supplied. The company, however, had a reserve of 1500 tons of coke when the works were shut down in February, and this is being drawn on, the expectation being that the Crow's Nest Coal Co. will shortly send in larger supplies. The Montreal & Boston C. Co. blew in one furnace this week and a second one will be started as soon as coke supplies are sufficient to run two furnaces.

COSTA RICA.

W. Macgregor of Berkeley, Cal., mining engineer for the Abangarez Goldfields, Ltd., of New York, operating the Abangarez concessions in Guanacaste district, says they have put up two mills, one of twenty stamps and one of ten. The principal values are in gold, averaging \$16 per ton, and in connection with the mills Macgregor has introduced the cyanide process there, by which their principal extraction of gold is obtained.

KLONDIKE.

Dawson advises say the sluicing season began April 27, and the washing of the dumps on all the Klondike creeks is well under way. An official statement from the Governor of the Territory says it is not the intention to establish an assay and gold purchasing office at Dawson, as none is needed. Last year the creeks in this district produced \$12,000,000 in gold. Duncan creek, it is said, is proving a good producer, and will add to the output for the season of 1903. Sulphur, Bear and Gold Bottom creeks have been greatly revived this spring. On Dominion 29 miles are being worked with success.

MEXICO.

SONORA.

The Nogales, Ariz., Oasis says the Big Mountain M. Co. is planning to increase operations at its Planchas de Plata group, 10 miles south of the International line and the Oro Blanco district of Arizona. The plans include a 250-ton mill, wire tramways, air compressors and machine drills, and an electric light plant.

E. Miller of California and son, C. A. Miller, are operating their mines at Baviacora, 100 miles north of Hermosillo, the San Carlos group, the rock running \$80 gold per ton. They also have silver-bearing ore. They are putting up a 50-ton cyanide plant and a 20-stamp mill, which they expect to have in operation by August 1. They have plenty of wood and an ample water right at the mines.

Manager H. C. Glore of the Washington & Sonora C. M. Co., operating east of Puerto on the Sonora railway, last week let a contract for sinking a shaft upon one of the ore bodies. He is also consulting engineer of the Sevilliana mine near Willard station, near Nogales, Ariz., owned by H. Prickett of Douglass, which is being reopened.

F. Garretson of Buffalo, N. Y., has a working bond on the Promontorio copper mine, 25 miles east of Hermosillo. He has also bonded adjoining properties from other parties.

La Cananea men have located 30 pertenencias of ground near Sonora river in Picacho district. The ledge is 20 feet wide and assays show values in gold and silver. The country rock is porphyritic. The claims are 7 miles east of Cananea. The survey of the new Yaqui River road runs within 1½ mile of the discovery shaft.

W. G. Campbell of Detroit, Mich., has taken up placer gold mining ground near Llano, in the southeast part of Ures district, near Soyopa, and is preparing for hydraulicking.

Four thousand pertenencias (10,000 acres) of placer ground have been taken over by F. E. Monteverde & Co. on the Yaqui river, below the ground of the Chi-

cago & Sonora M. Co. and extending to Camaripa. A drilling machine will be used to prospect the ground.

A strike is reported in the Golfo del Oro group on the Yaqui river, being made in La Cobriza mine, showing the vein 4 feet wide, assaying \$100. The ore shows free gold. Through this section three railroads are planned and all three surveys cross the Golfo del Oro property, says Manager Grover. The Golfo del Oro Co. is composed of Colorado Springs, Colo., men—J. K. Brunner, Grover, et al.

Superintendent De Camp of the Lucky Tiger mine south of Douglas, Ariz., says he put on last week 200 Yaqui Indians at work in the mine, in addition to the 100 men already on the payroll. The gold ore is carried overland to Turracachi, a station on the Nacozari railroad, 30 miles from the mine. Several carloads are on the ground at Turracachi, and it is the intention of the company to ship a trainload to the El Paso smelters by June 1.

The Nogales Oasis says D. P. Pinelli has organized a company to work the La Esmeralda mine near Moreno.

TAMAULIPAS.

Tampico reports say there are six distinct companies, including the Pan-American Co., mining for asphalt between that place and Tuxpan. The Pan-American Co. has put in a plant near Tamiahua lake, north of Tuxpan, which will have a capacity of producing several hundred tons of refined asphalt daily. Other companies are prospecting around the town of Chapopote (the native name for crude asphalt).

SOUTH AFRICA.

TRANSVAAL.

London advices say the Rand gold output for April is estimated at 230,000 ounces, an increase of 12,500 ounces over March. The production in April, 1902, was 119,589 ounces.

PERSONAL.

D. LANYON, a mining man of Australia, is in San Francisco, Cal.

E. BARTON HACK of Denver, Colo., is in Chicago for a short stay.

W. S. BROWN of Con. Mercur Co., Mercur, Utah, is at their mines.

F. L. SMITH of Denver has returned there from Los Angeles, Cal.

A. J. OREM of Salt Lake City, Utah, is in the East on mining business.

M. BRINN, a mine owner of Sutter Creek, Cal., is in San Francisco, Cal.

R. M. GREEN, a mine owner of Oroville, Cal., is in San Francisco, Cal., on business.

F. J. SIEBERT, interested in mines at Tonopah, Nev., is in San Francisco, Cal.

E. F. FRENDETHAL, manager of the Manhattan mine of Pioche, Nev., is in the East.

W. W. BELL of Bradford, Pa., has returned there from a trip through the West.

B. McDONALD, E. M., of Spokane, Wash., is in Rossland, B. C., examining mines.

W. H. BRAY, a mine owner of Nevada City, Cal., is in San Francisco, Cal., on business.

J. F. HOLDEN of Chicago, Ill., is manager of the Coronado G. M. Co., near Congress, Ariz.

D. S. FISH has resigned as superintendent Esperanza Oil Co. at Coalinga, Fresno county, Cal.

W. W. BRYNE of Salt Lake City, Utah, is examining mines in Neal and Pearl district, Idaho.

J. C. LYNCH of the Daly-West and Thompson Cos. of Park City, Utah, is in Chicago, Ill.

H. HUCKINS is superintendent of the Junction mine at North San Juan, Nevada Co., Cal.

C. A. CANFIELD, interested in oil properties in southern California, is in San Francisco, Cal.

F. SUTTON, a mine owner of Sonora, Tuolumne Co., Cal., is in San Francisco, Cal., on business.

H. W. SHERMAN of Salt Lake City, Utah, is in the East in the interest of the East Pacific M. Co.

A. DE CHAMPAGNE, interested in mines at Weaverville, Trinity Co., Cal., is in San Francisco, Cal.

T. AISHTON, interested in mining properties in Australia and the Orient, is in San Francisco, Cal.

H. G. VERCOE, superintendent Fresno copper mines, has returned to the mines from San Francisco, Cal.

P. S. COULDREY, general manager of the Le Roi No. 2 Mines, Ltd., returned to Rossland, B. C., last week.

W. E. BORAH returned last week to Salt Lake City, Utah, from an examination of mines at Elko, Nev.

F. P. SWINDLER, formerly with the De Lamar mines, is manager of the Duplex mines at Searchlight, Nev.

A. BUCKBEE, manager of the Virtue Con. mines, near Baker City, Or., is visiting at Salt Lake City, Utah.

S. P. SMITH, JR., is superintendent of the Ocean Wave coal mines at Williamsburg, Fremont county, Colo.

F. R. CLEARY is superintendent Caribou and Sauer Dough oil companies at Coalinga, Fresno county, Cal.

H. E. VAIL has resigned as metallurgist of the Shawmut mine, near Chinese Camp, Tuolumne county, Cal.

R. J. KING of Hanford, Cal., is superintendent Esperanza Oil Co. at Coalinga, Cal., vice D. S. Fish, resigned.

H. B. VERCOE, managing director Fresno Copper Co., Ltd., of California, has gone to London, England.

R. CHAUVENET has returned to Denver from Lake county, Colo., where he has been examining mining properties.

M. L. HEWETT, manager Cataract C. M. Co., at Basin, Mont., returned last week from a six months' trip East.

W. J. CASEY is superintendent of the Republic Con. G. M. Co. at Republic, Wash., vice J. Bresnahan, resigned.

MANAGER F. WILSON of the Lucy L. and Copper Belt Cos. of Deep Creek district, Utah, is in the East on business.

J. H. KNOWLES is superintendent of the Burns group of copper mines, 25 miles from San Simon, Cochise county, Ariz.

B. T. LLOYD of Salt Lake City, Utah, manager of the Copper Mountain mine of Beaver county, Utah, is in Chicago, Ill.

H. T. POWER, manager of the Hidden Treasure G. M. Co. at Sunny South, Placer Co., Cal., is in San Francisco, Cal.

J. H. MAGEE is superintendent of the quicksilver retorting plant being built by the Sacramento M. Co. at Mercur, Utah.

E. W. KING of Lewiston, Mont., owning mines near Landusky, Mont., has returned from a business trip to Chicago, Ill.

R. BLACKSTONE, formerly chief engineer Homestake mine, Lead, S. D., is assistant superintendent under T. J. Grier.

W. B. AKERS of Spokane, Wash., interested in the Coronado G. M. Co., operating near Congress, Ariz., is at their mines.

G. N. PORTER is metallurgist of the Shawmut mine, near Chinese Camp, Tuolumne county, Cal., vice H. E. Vail, resigned.

E. A. WILTSEE, consulting engineer Venture Corporation of London, England, is visiting the principal mining camps of Mexico.

G. BLACKWELL of Murray, Idaho, has gone to Libby, Mont., to take charge of the A. K. M. M. Co.'s mill in West Fisher district.

C. D. VAN DUZER, manager of the Lone Mountain M. & D. Co., near Tonopah, Nev., is in New York on company business.

MANAGER HERRON of the Tomboy G. M. Co., Ltd., returned last week to Telluride, Colo., from a business trip to New York.

C. K. MCCORMICK returned last week to Salt Lake City, Utah, from an examination of mines at Gold Roads, Mobave county, Ariz.

C. E. CADY, interested in mines in Tonto district, near Globe, Ariz., has gone to Colorado Springs, Colo., for a protracted stay.

PRESIDENT S. BAMBERGER AND SUPERINTENDENT F. P. JANNEY of Bamberger's De Lamar mines are at De Lamar, Nev.

W. F. DETERT, president of the Argonaut G. M. Co., and superintendent of the Zella mine at Jackson, Cal., is in San Francisco, Cal.

O. A. PEASE, president of the Amalgamated G. M. Co. of Mohave county, Ariz., returned last week from a month's business trip in the East.

F. J. GREISBERG has resigned as electrical engineer for the Standard Con. M.

Co. at Bodie, Mono Co., Cal., and goes to San Francisco, Cal., June 1st.

T. VAN METER of Weiser, Idaho, is superintendent of the United Gold Ledge M. Co., operating in Thunder Mountain district, near Roosevelt, Idaho.

W. B. MUCKLOW of Hartford, Conn., was elected president of the Majestic C. M. & S. Co., operating near Milford, Utah, vice A. B. Lewis, retiring.

A. E. KLAUSER of Toledo, Ohio, president Yaqui S. & R. Co., operating at Toledo, east of Sonora, Mexico, is in Mexico looking after mining interests.

B. McBEATE, superintendent of the Monte M. & M. Co., Gold Hill district, near Placerville, El Dorado county, Cal., is in San Francisco, Cal., on business.

J. A. McINTIRE of Sacramento, Cal., owner of the South Keystone mine, between Amador City and Sutter Creek, Amador Co., is in San Francisco, Cal.

E. H. BENJAMIN, E. M., of San Francisco, Cal., is at the Golden Eagle mine of the Hayden Hill M. Co., Lassen county, Cal., of which he is consulting engineer.

W. F. SNYDER, manager of the Western Exploration Co., operating the Balaklala copper mines at Kennet, Stbasta county, Cal., is at Kennet from Salt Lake City, Utah.

D. L. GREGG, for a number of years connected with the Mine & Smelter Supply Co. of Denver, Colo., has been appointed manager of their El Paso, Texas, branch house.

MANAGER G. H. EVANS of the Gold Pan placers, near Breckenridge, Colo., returned last week from an extended trip, having visited San Francisco, Cal., Mexico and New York.

P. WILLIAMS of Salt Lake City, Utah, will take charge of the Silver Belle properties at Red Rock, Pima county, Ariz., where the owners propose putting up a 300-ton smelter.

R. F. HOLDEN, managing director of the United States M. Co., operating at Bingham and Eureka, Utah, returned to Salt Lake City, Utah, last week from a business trip East.

J. M. DIKEMAN, former superintendent Red Boy mine, near Sumpter, Or., has gone to South Africa as consulting engineer for the United Rhodesia Gold Fields Co., operating in Rhodesia.

J. BRESNAHAN, has resigned as superintendent of the Republic Con. G. M. Co. at Republic, Wash., and will resume traveling and examining mining properties for P. Clark & Co. of Spokane, Wash.

H. H. CLAUDET, technical representative of the Canadian Ore Concentration Co., operating the Elmore process at Rossland, B. C., returned last week from a business trip to San Francisco, Cal.

PRESIDENT AGASSIZ, VICE-PRESIDENT LIVERMORE AND CONSULTING ENGINEER LEAVITT of the Calumet & Hecla mines at Calumet, Mich., are at the property on their usual spring visit.

J. WAUGH has resigned the superintendency of the C. P. R. lime quarry at Fife, B. C., being succeeded by P. M. Stewart. Mr. Waugh has gone to Winnipeg to engage in business for himself.

B. J. GLEASON, formerly of Deadwood, South Dakota, is acting superintendent of the Old Dominion mine, near Colville, Stevens county, Wash., vice M. McCarty, who is in California for an extended stay.

H. COLBATH, for a number of years assayer and metallurgist for the Con. Mercur Co. at Mercur, Utah, has resigned to accept a similar position at Bamberger's De Lamar mines and mills at De Lamar.

B. KADISH, owner and manager of the Baker City Sampling Works at Baker City, Or., has gone to New York, and will sail June 1 for an extended European tour, during which his address will be Vienna, Austria.

J. E. SPURR, geologist in charge of the U. S. Geological Survey of Tonopah district, Nev., has returned to Tonopah to complete the field work which he was forced to suspend last fall on account of the snow.

A. B. LEWIS AND W. A. FARISH returned to Salt Lake City, Utah, last week from attending the annual meeting of the Majestic C. Co. at Denver, Colo., and were accompanied by H. M. Holbrook of Boston, Mass., of the same company.

J. AND T. HOATSON, P. Ruppe, H. Hill, C. Briggs and J. Mauser of Calumet, Mich., and G. L. Tenner and J. Oliver of Pittsburgh, Pa., have returned from a visit to the mines of the Calumet & Arizona M. Co., near Douglas, Ariz., in which they are interested.

Obituary.

J. DELANEY, pioneer miner and prospector, died at Juneau, Alaska, May 1. Deceased was 64 years of age and a native of Ireland.

W. H. DEWEY, an Idaho mine owner, died at his home in Nampa, Idaho, May 8. He was one of the pioneers of Owyhee county and was the locator of the Trade Dollar mine near Silver City. He was also interested in the Dewey mine in Thunder Mountain district.

R. M. HARTMANN, Ph.D., professor of chemistry in the Colorado School of Mines at Golden, Colo., died May 8, and C. D. Test, an instructor in the same branch, is in a serious condition as the result of asphyxiation by fumes of sulphuric acid in the experiment room while endeavoring to repair the machinery by which the acid is made.

W. P. SCOTT, general manager and part owner of the Black Oak mine, near Soudbyville, Tuolumne county, Cal., died in Oakland, Cal., on the 6th inst., after a lingering illness. A combination of ailments caused death. Deceased was connected with the Black Oak mine for a number of years. He leaves a wife and two step-children, besides three brothers, one being W. G. Scott, superintendent of the Black Oak mine.

A. SAHLBERG, formerly of Butte, Mont., a mine owner at El Oro, Mexico, died May 6 at El Oro. Sahlberg went to El Oro ten years ago from Montana and took a position as shift boss in a mine owned by G. Frisbie. He observed that the vein in the Frisbie mine ran north, resigned his job as shift boss and located a prospect adjoining the Frisbie, on which he struck the vein of what is now the Esperanza. Deceased was a native of Denmark.

Commercial Paragraphs.

THE Rand Drill Co. report the removal of their San Francisco, Cal., office from 223 First street to the Rialto building, additional space being needed because of the rapidly expanding business of this company.

THE Mine & Smelter Supply Co., Denver, Colo., report a rapidly increasing sale of Willey tables. They recently received an order for fifty latest pattern No. 5 tables from the Doe Run Lead Co. of Missouri. A number of improvements have been made on the table recently.

THE Lunkenheimer Co., Cincinnati, O., report that on account of the demand for their line of brass and iron steam specialties they have been compelled to increase their foundry output 50%. Machine tools of the most improved type are being installed in various departments as fast as they can be obtained.

THE Masurite Explosive Co. of New York City have removed their executive offices to Sharon, Pa., where their manufacturing plant, recently completed and covering thirty-seven acres, is located, and their Pacific coast representative, G. W. Myers, Hayward Bldg., San Francisco, Cal., announces that westward shipments of masurite will soon begin. He will also establish a magazine near San Francisco, Cal.

THE Union Iron Works of San Francisco, Cal., is installing a power transmission plant near Reward, Inyo county, Cal., from which it will transmit power electrically 2 miles to the mill of the Reward G. M. Co., where induction motors will be used to drive a 20-stamp mill, air compressor and rock breaker. The apparatus, which has been bought from the Westinghouse Electric & Manufacturing Co., includes a 120 K.W., three-phase alternator; a 2 H. P. exciter; a type "6" switchboard panel, including voltmeters, ammeters, rheostats, etc.; two 50 H. P. type "C" induction motors, complete, with auto-starters, slide rails, etc.; a 15 H. P. induction motor; three 7½ K.W., O. D. transformers; two 1 K.W., O. D. transformers, and eight lightning arrester units. The transmission will be at 2200 volts.

A. RIEPPEL, Koeniglicher Baurat, of Nurnberg, Germany, managing director Augsburg Nurnberg Mfg. Co., builders of structural iron work, engines, bridges, cars, etc., in Europe, is visiting in the United States for the first time. His works employ 16,000 men and have over 2000 at work on the bridges, etc., of the new railroads being built by Germany in China. Their latest success has been with gas engines, both for gaseous and liquid fuel. They have long built these engines in

smaller units up to 400 H. P. and operated with petroleum; but for the use of waste gas as well as producer gases, and in larger units, they have recently developed an entirely new design. The engine, which is of the double-acting cycle type, generally in tandem arrangement, is best adapted for the various purposes of modern power development up to the largest units required by municipal central stations and iron and steel works. Rieppel's visit was made to interest the Allis-Chalmers Co. in the manufacture of the products of his company. A contract was entered into by the two companies giving the Allis-Chalmers Co. the exclusive right to manufacture and sell the Nurnberg gas engine for the United States and selling rights in the far East and South Africa. The Augsburg Nurnberg Mfg. Co. have within the past few months received orders for 50,000 H. P. throughout Germany and Spain, chiefly for generating electric energy and for blast furnace and spinning mill work. One of these engines is being built for an important spinning mill in northern Germany, where the engine will be operated by producer gas. Mr. Rieppel is on a tour of inspection throughout the United States, after which he will visit the new and extensive works of the Allis-Chalmers Co. at West Allis, where these engines will be built.

Books Received.

A treatise on "Electro-magnetic Phenomena" and on the "Compass and Its Deviations Aboard Ship," by Commander T. A. Lyons, U. S. A. This is published in two volumes: Vol. I, 556 + XV pages, 385 figures and plates, \$6 net; Vol. II, 582 + VII pages, 203 figures and plates, price \$6 net; express or postage additional. John Wiley & Sons, New York; Chapman & Hall, London. These volumes treat on electro-magnetic phenomena, dealing with all that is latest on this interesting subject. Among other subjects treated, are the sun's spots, the Aurora, electric discharges in high vacua, magnetic storms and telluric currents, and also the electro-magnetic theory of light. In the second volume the compass forms an interesting chapter and considerable space is given to the mathematical theory of deviation of the compass. These volumes are replete with information along the lines indicated which is of great interest to engineers, navigators and others interested in the pursuit of knowledge in the science of electro-magnetism.

Catalogues Received.

The five-ply, welded chrome steel vault plate manufactured by the Chrome Steel Works of Brooklyn, N. Y., is fully described, with a chapter on its uses, in a recent catalogue issued by them.

The Austin Mfg. Co. of Chicago, Ill., has issued a handsome catalogue, profusely illustrated and descriptive of the Austin gyratory crusher and its application to mining, quarrying, etc. Their conveyors, grade wagons and dump cars are also completely described. The catalogue is a work of art from the typographical standpoint.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

NUT LOCKS.—No. 727,393. May 5, 1903. W. A. Lewis, Battle Mountain, Nev.; two-thirds assigned to R. M. Horton and John Diamond of same place. This invention is designed to provide a simple, effective nut-locking device for use in bridge building, railway construction, and wherever there is a tendency for nuts to jar loose. It consists in the combination of a nut lock of a bolt, a nut screwing thereon, a wedge pivoted in the head of the bolt, a second nut screwing on the bolt and engaging said wedge and having a notch undercut in the direction of the threads of said nut, and latch means carried by the first named nut engaging said notch.

STEAM GENERATING FURNACE.—No. 727,346. May 5, 1903. J. L. Groux, Jerome, Ariz. This invention relates to a combination furnace and steam generator in which a crucible occupies the lower part of the furnace, and above this are a series of approximately vertical water tubes connected at the lower end with a water supply pipe and at the upper end with a steam drum. It consists in the combination with these water tubes of a series of inclosing water jackets properly spaced to allow the water tubes to pass between the water jacket sections and communicate with the water supply and steam drum which are exterior thereto.

WAIST FORMERS.—No. 727,273. May 5, 1903. F. S. Boedfeld, San Francisco, Cal.; one-half assigned to Wm. L. Spencer of same place. This invention relates to improvements in garment supporting devices, particularly to that type adapted to be attached to a corset for the purpose of holding the

waist in proper position. Its object is to provide a simple adjustable waist holder or former that can be quickly attached to or detached from the corset after the latter has been fastened and which will not become readily released therefrom accidentally.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 5, 1903.

727,252.—DISPLAY FRAME—J. B. Allen, S. F.
727,053.—SEWING MACHINE—D. L. Anthony, Sacramento, Cal.
727,052.—EXPLOSIVE—M. W. Beardsley, Oakland, Cal.
727,044.—CIRCUIT CLOSER—W. J. Bell, Los Angeles, Cal.
727,273.—WAIST FORMER—F. S. Boedfeld, S. F.
727,275.—ANIMAL TRAP—C. C. Bowen, Los Angeles, Cal.
727,072.—SAND PUMP—A. J. Bramlette, Downey, Cal.
727,077.—LOCATING MINERALS, ETC.—F. H. Brown, Los Angeles, Cal.
726,801.—SMELTING FURNACE—A. W. Catton, West Seattle, Wash.
727,801.—VAPOR STOVE—L. Dahl, Palo Alto, Cal.
727,814.—NUT LOCK—J. A. Duffy, Pomona, Cal.
727,815.—FIRE ALARM—T. B. & F. A. Duncan, Newberg, Ogn.
726,855.—GOLF CLUB—J. D. Dunn, Los Angeles, Cal.
727,316.—STEAM GENERATOR—J. L. Groux, Jerome, Ariz.
727,421.—COMBINATION TOOL—W. E. Haight, McMinnville, Ogn.
727,332.—TREATING ORES—H. Hirschling, S. F.
727,027.—BLEACHING NUTS—H. J. Hoffmayr, Ventura, Cal.
726,939.—TRACTION ENGINE—J. K. Kendrick, Germantown, Cal.
727,393.—NUT LOCK—W. A. Lewis, Battle Mountain, Nev.
727,414.—OIL BURNER—J. McDermott, West Berkeley, Cal.
727,415.—OIL BURNER—J. McDermott, West Berkeley, Cal.
726,973.—COMBINATION TOOL—J. D. McKinnon, Portland, Ogn.
727,193.—HANDCUFFS—J. W. Pettijohn, Montesano, Wash.
726,454.—CHICKEN ROOST—E. Royce, No. Yambill, Ogn.
727,464.—DRESS FORM—A. E. Scott, S. F.
727,321.—GRAVITY TRACK—C. M. Smith, Los Angeles, Cal.
727,222.—STEERING APPARATUS—C. M. Smith, Los Angeles, Cal.
727,223.—SWITCH—J. Smith, Tacoma, Wash.
727,020.—NEEDLE—Annie W. Simson, Los Angeles, Cal.
727,035.—SASH FASTENER—H. VanWile, S. F.
727,238.—HEATING OVENS—C. E. Warren, Los Angeles, Cal.
727,243.—KNEE PROTECTOR—Martha M. White, Campbell, Cal.
727,045.—BRAKE FITTING—O. Whitmore, San Diego, Cal.
727,527.—FENCE WIRE CLAMP—G. H. Wright, Spokane, Wash.
727,529.—LOGGING DOG—C. J. Young, Seattle, Wash.

Latest Market Reports.

SAN FRANCISCO, May 15, 1903.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 54c, refined (1000 fine): San Francisco, 54c; Mexican dollars, 40 @ 42c San Francisco, 42c New York.

Silver has shown no material change the past week, but a further advance is looked for, as the demand is somewhat greater than the normal supply. That is the silver resulting from the treatment of gold, lead and copper ores. There are few mines operating in the United States which are strictly silver producers only, the metal usually being associated with sulphides of the base metals and with gold. Should the price go much higher or show an indication of remaining at or near the present price indefinitely, it will no doubt have the effect of reopening silver mines now idle.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50 @ 14.75; Electrolytic, 1 to 3 casks, \$14.50 @ 14.75; Casting, 1 to 3 casks, \$14.50 @ 14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £63 2s 6d spot per ton.

The consumption of copper for 1902 was divided among the following countries: Germany, 107,906 tons; France, 55,550; England, 121,877; North America, 224,000; Austria-Hungary, 22,440; Russia, 24,398; Italy, 14,063; Scandinavia, Spain, Belgium, Turkey and Asia, 20,000 to 25,000, making a total of 595,234 tons. The production during the same period was 557,492 tons, showing that the consumption was about 40,000 tons in excess of the production.

The metal shows no material change in price, though it is thought a somewhat higher price may be reached; but it is not likely to go above 15 cents and remain there for any considerable period.

LEAD.—New York, \$4.37½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$1.50, carload lots; ½c 1000 to 4000 lbs.; pipe ½, sheet 6, bar 5½c; pig, \$4.75. London: £11 8s 9d per long ton=2.75c per lb.

SPELTER.—New York, \$5.75; St. Louis, \$4.60; London, £21 7s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$29.65 @ 29.75; San Francisco, ton lots, 31½c; 500 lbs., 32c; 200 lbs., 32½c; less, 33c; bar tin, 3½c, 35c @ 37½c. London, £134 10s spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.50 @ 46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 per flask of 76½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 31c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17.15c.

NICKEL.—New York, 50 @ 60c per lb.; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$20.60 @ 21.50; gray forge, \$19.85; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31.50; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00 @ 22.00; extra sizes higher; redwood, \$22.00 @ 23.00; lath, 4 feet, \$4.25 @ 4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @ 32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.25; Cut, \$3.35; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. O. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$5.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c per set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2.50 @ 2.75; Hewmore, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ¾c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @ 9c per lb.

BONE ASH.—Extra No. 1, 5 @ 6c per lb. No. 1, 4 @ 5c.

BORAX.—Concentrated, 7 @ 9c per lb powdered, 9 @ 12c; fused, 25 @ 30c.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5 @ 7c.

MANGANESE.—Pure, 1 lb., 60c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

BISMUTH.—Subnitrate, per lb., \$1.60.

SODIUM.—Metal, 1 lb., \$1.00.

MERCURY.—Bichloride, 1 lb., 90c.

PHOSPHORUS.—(American) 1 lb., 75c.

SILVER.—Chloride, 1 lb., 90c @ \$1.00; nitrate, 55c.

URANIUM.—Oxide, 1 lb., \$3.50.

ZINC.—Metallic, chemically pure, 1 lb., 50c; dust, 1 lb., 10c; sulphate, 1 lb., 10c. (These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

COMPETENT MILLMAN, MACHINIST AND Chemist. Experience free mill and concentrating. College education. Have built and operated mills in Montana for 12 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care this office.

CYANIDE CHEMIST OR MILL SUPT. Technical graduate. Specialty, construction; also, successful treatment of low grade ore and slimes. Good references. Address "Spanish," this office.

MILLMAN DESIRES POSITION WITH GOLD mining company to erect or take charge of stamp mill. Extensive experience gained in the treatment of ores in United States, Central and South America. Can assay and test ores to determine best method of treatment. Excellent references. Address "Aurum," care of this office.

MINE FOREMAN WISHES A CHANGE OF position—foreman or superintendent. Age 37. Experience, 13 years. Can assay and survey. State locality and salary paid. No objection to South America or Mexico. Some knowledge of Spanish. Address M. O. I., this office.

POSITION WANTED IN ASSAY OFFICE AS assistant by man 30 years old. Just finished year's course in good school and not afraid of work. Mexico or Arizona preferred. Address R. H. C., this office.

WANTED.

WANTED—Some Party for Half Interest, to pay expense of three practical miners, to prospect in Mexico. Best references given. Address Box 644, Phoenix, Arizona.

WANTED—MILL TAILINGS, Gold, silver or lead, in New Mexico, Arizona or old Mexico. Will buy or lease. Give location, quantity and value. A. E. VAN VELSAN, Telluride, Colorado. Box 181.

Wanted, by a Prominent Mining and Smelting Company, A LARGE COPPER PROPERTY in Mexico, Arizona, Utah, or New Mexico, sufficiently prospected to admit of intelligent examination. Address Box 28, this office.

Wanted—A Superintendent

For foundry, forge, machine and boiler shops employing 200 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answers confidential. Address Z. P. O. Box 153, Station C, Los Angeles, Cal.

MINING STOCKS WANTED.

If you are a stockholder in any good going mining company and want to sell your shares

WE CAN GET YOU CASH.

Send for our price list of 500 stocks. It tells what we will buy and what we will sell.

CATLIN & POWELL, 94, 35 WALL ST. NEW YORK.

PICHER Natural Blue Lead Paint.

Best protective paint for all iron and steel surfaces. Withstands the action of sulphuretted hydrogen gases. Send 25 cts. to cover express charges for one quart and illustrated booklet free. Address Dept. B.

PICHER LEAD CO.

Chicago, Ill. Joplin, Mo. New York, N. Y.

THE CALIFORNIA DEBRIS COMMISSION having received application to mine by hydraulic process from W. F. Mills, in Willow Creek Consolidated Mine, near Camptonville, Yuba County, Cal., draining into North Fork of Yuba River which reaches Feather River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., June 1, 1903, at 1:30 P. M.

PRINTING. We furnish all stock and do printing at the following prices: 100 envelopes 40 cts., 500 \$1.25, 1000 \$1.75. Bill heads, note heads, cards, tags, etc., at same price. Samples of work free. Pacific Commercial Co., 325 Davis St., San Francisco, Cal.

HENRY CAREY BAIRD & CO., INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS. 810 Walnut St., Philadelphia, Pa., U. S. A.

Our New and Revised Catalogue of Practical and Scientific Books, 82 pages, 8vo., a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

FOR SALE.

Tonopah Claims for Sale.

I have several good prospects for sale, located in known mineral belt in Tonopah mining district. Groups suitable for incorporation. Claims \$100.00 to \$250.00 each. Correspondence solicited.

Address **WALTER OSBORN,** BOX 309, TONOPAH, NEVADA.

FOR SALE FOR CASH OR WILL BOND.

ONE FULL CLAIM with water right and millsite. Partially developed. Prospects well in free gold. Will stand full investigation. Will deal with principals only.

Address **J. M. QUINN, Big Oak Flat, Cal.**

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of April, 1903, an assessment (No. 25) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of June, 1903, to pay the delinquent assessment, together with the costs of advertising and expense of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office—415 Front street, San Francisco, California.

WILLIETTA MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Jacksonville, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of April, 1903, an assessment (No. 6) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Rooms 233-234 Crocker Building, corner of Post and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of June, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 2d day of July, 1903, to pay the delinquent assessment, together with the costs of advertising and expense of sale.

By order of the Board of Directors.
M. McALLISTER, Secretary
Office—Rooms 233-234 Crocker Building, corner of Post and Market streets, San Francisco, California.

Established 1888. Telephone 1083.

WHEN LOOKING FOR Fire Insurance

Get the Best Companies.

They are represented by
ROBT. S. BRANNEN,
1622 ARAPAHOE STREET,
2-3-4-5-6 Arapahoe Bldg. DENVER, COLO.

MONEY LOANED MINES.

Developed or partly developed which have Ore in sight. First-class references. Established 1856.

E. N. BREITUNG & CO.,
Marquette, Mich.

Michigan College of Mines.

F. W. McNAIR, President.

A State institution making use of the facilities of the great Lake Superior mining district. Regular summer term begins June 8. For Year Book, giving list of graduates and their occupations, apply to President or Secretary.

Imperial Cable Coating.

For Hoisting, and all Wire Cables. PRESERVES. Over 1000 barrels sold by us in California, proving its superiority. Barrels 40c., cases 50c. per gallon.

GEO. PARTRIDGE & CO.,
123 California Street, San Francisco, Cal.

Cheaper Than Horses!

Our engines cost hardly a third as much as horses, for hauling heavy loads, and are rapidly displacing them for hauling ore, stone, lumber, etc., when the work is sufficient so that an engine can be used to advantage. They work 24 hours a day, never tire, sicken or die, and eat only when at work. We make them for all countries, all climates, all soils—from plowed fields to rocky wastes or forest stubble. We have large experience.

BUFFALO PITTS COMPANY,

31 Carolina Street,

Established 1837.

Buffalo, N. Y.

WEBBER PATENT

Compression Grip

with Patent Automatic Attacher,

used only on the Patent

Bleichert Wire Rope Tramway,

Superior to all others.

THE TRENTON IRON CO.

TRENTON, N. J.

Manufacturers, Engineers and Contractors, and Sole Licensees in North America for the Bleichert System.

Also, Wire Rope Equipments for Cable Hoist Conveyors, Surface and Underground Haulage, Transmission of Power, etc.

No lugs or knots of any kind required on the traction rope, giving longer service, and saving in repairs.

Illustrated book upon application.

New York Office--Cooper, Hewitt & Co., 17 Burling Slip.

Chicago Office--1114 Monadnock Building

DENVER OFFICE--R. D. SEYMOUR, Manager, 1711 Tremont St.

THE VAJEN Improved Head Protector.

Let us send you a catalogue, showing the latest model of THE VAJEN HEAD PROTECTOR, made especially for entering mines after explosions or for use in detecting gases, without danger to the wearer. It enables a man to work in a mine for three hours without recharging. Of inestimable value to mine inspectors.

Rapid Shaft Sinking.

On the Witwatersrand in South Africa some rapid shaft sinking has been done at several of the mines. Among the most noted of them are the Catlin, Milner and Rudd, and more recently the Wolhuter. The Catlin shaft of the Jupiter Co. was started in June, 1896, and work continued till March, 1897, during which 906 feet were sunk at an average of 90.6 feet per month. Sinking was resumed in this shaft in January, 1898, and during the twelve months of that year 1695 feet were sunk, or an average of 141 feet per month. Later, in 1899, this shaft was carried down at an average of 144 feet per month. The shaft is now over 3750 feet deep.

The Howard shaft of the Simmer & Jack West was sunk for twelve months from 891 to 1551 feet at an average of 129.2 feet per month.

The Milner shaft of the South Geldenhuis Deep from August 1, 1898, to August 31, 1899, sank at an average rate of 152½ feet per month, and the Rudd shaft, on the South Rose Deep, from September 1, 1898, to September 30, 1899, was sunk at an average of 138 feet per month to 2425 feet.

In November, 1902, the Wolhuter shaft was sunk 209 feet in thirty days, which was the most rapid shaft sinking in hard rock ever recorded.

In sinking these deep shafts there are two contingencies always given consideration. These are possible large volumes of water and increase of temperature. Some records made in the Rand shafts as to amount of water encountered are of interest, and show the greatest volume of water to be com-

paratively near the surface, for in great depth there is much less water.

The Robinson Deep pumps from its shafts 88,000 gallons per twenty-four hours, of which 60,000 gallons are from a depth of 166 feet from the surface.

The Rhodes shaft at 2015 feet raised 28,820 gallons in twenty-four hours, of which 28,280 gallons were raised from the 500-foot station and 540 gallons from the 1800 point.

The Howard shaft is 3408 feet deep and is dry at the bottom, though 11,500 gallons are raised from 250 feet and 320 from 1300 feet.

The Catlin shaft at 3750 feet depth raised 4608 gallons per day from 130 feet below the surface and 1840 gallons from 1500 feet. The bottom of the shaft is dry.

The Angelo Deep was sunk 2300 feet and had a pumping station at 250 feet and another at 500 feet, the water making at the rate of 2000 gallons per day. Below the 500 the shaft was dry. A borehole was drilled in the bottom of the shaft, going down 240 feet, where a flow of 1500 gallons per day was encountered. Below this point in the borehole no water was encountered.

Forty-three Years Old.

It will be 43 years to-morrow since the MINING AND SCIENTIFIC PRESS was established. That is, to-morrow, May 24, 1903, this journal will enter upon its 44th year of successful existence. In this issue is presented a photographic reproduction of the front page of No. 1, Vol. I, May 24, 1860. There is also reproduced the front page of the issue of Nov. 30, 1860, when the title of the journal was changed to the MINING AND SCIENTIFIC PRESS. There is likewise reproduced from page 150 of that issue the little notice of \$2500 reward (which the MINING AND SCIENTIFIC PRESS afterwards increased to \$5000) for some process to treat gold sulphurets, and which occasioned the invention of the chlorination process, thus solving an important metallurgical problem of that day.

An illustration of how the journal looked in 1860 is deemed of sufficient interest to be shown in the issue of to-day, No. 2235. These 2235 numbers of the MINING AND SCIENTIFIC PRESS, from May 24, 1860, to May 23, 1903, contain and comprise all that is known of modern mining and metallurgy, a progress and development in which this journal has borne prominent part. What has been done is but an index of the future. More need not be said; less could not be said.

The March of Progress.

Frequently announcement is made that some one has invented or discovered a new process "which will revolutionize the mining industry." None of these processes have accomplished this result as yet, though there are processes which have had an important influence on the industry of mining. Pyritic smelting, though not a new process, has only of late years been successfully applied in the United States, but its influence is felt in many districts, for by its means costs may be reduced in some cases to such

an extent that commercial success is now made where it had previously been impossible. The separation of zinc from other minerals in the concentration of complex sulphide ores is also an important step in the metallurgical field. Many of the claims for the cyanide process, which ten years ago were looked upon with distrust, have since become accomplished facts and, in some respects, the process has achieved more than was originally claimed for it by its early advocates. There is still room for other and newer processes, and still opportunity to reduce the expense of ore reduction. Experiments are constantly in progress with a view to improvement and reduction of cost. This constant effort and competition have resulted in saving a higher percentage of values, at less cost, until the limit seems to have been reached, but, as in the past, the future will show that we are not now looking far enough ahead, and additional improvements and reductions in cost may still be anticipated.

The Source of Gold.

The greatest incentive the miner has to seek for gold is the discovery of rich ore or placer gold in an unsuspected place. There are streams, gulches and flats, famous in mining history for the rich placer mines developed in them, but the source of the gold is not always apparent. Generally, in these later days there are those who at once seek the source of the gold found in rich placers, in the belief that a more valuable and permanent mine is likely to result if this source can be found. There are instances where years have passed before the source of gold in a placer gulch has been recognized, and in some instances the original source of the gold still remains undiscovered. The trained geologist in such cases, after careful investigation, can usually reach a conclusion, satisfactory to himself, but the miner is often at a loss to account for the existing condition of things. It is not always found that a rich vein produces rich placer deposits. The erosion of veins and deposits which produce telluride gold ores does not always result in rich placers. The erosion of the telluride ores of the Black Hills, South Dakota, has not, as far as known, resulted in placer deposits, though those of Cripple Creek, Colo., occurring under entirely different conditions—in fissures, instead of blanket deposits—have produced placers. In some regions rich placer deposits have been discovered and worked out, and the source from which the gold came has never been satisfactorily determined. The ancient river channels of the Forest Hill divide, Placer county, Cal., which have produced many millions, appear not to have derived their gold from quartz veins such as exist in other portions of the State, but seem to have been the result of erosion of a slaty or schistose rock, in which the gold occurred in narrow seams and in pockets. In some of these mines large nuggets have been found in which the edges of the crystallized gold were still sharp, being little or not at all abraded by the detritus of the stream, being conclusive evidence that the gold is found near its original source. Gold has also been found in the bedrock in situ, further proving that the gold of that section is derived from the pockets and seams in the rock, and not from quartz veins of the ordinary type.

Operating Costs on the Mother Lode.

The annual report of the Central Eureka mine, at Sutter Creek, Amador county, Cal., affords valuable information as to the costs of operating on the Central Gold Belt of California, commonly known as the Mother Lode. The Central Eureka mine lies between the South Eureka, down 2300 feet, and the Amador Consolidated, familiarly known as the Old Badger and Eureka, down 2100 feet, but with the collar of the shaft more than 100 feet below that of the Central Eureka. The shaft of the latter mine is an incline down about 2100 feet. The angle of dip is about 65°. The formation passed through is black slate and amphibolite schist. The slates of the foot wall swell upon exposure to the air and are a source of much expense. In this respect, however, they are not so bad as those in some of the other mines of the vicinity, notably the Oneida. The Central Eureka has a single fissure extending from the surface to the lowest development. This fissure is filled with either

crushed and foliated black slaty material—the "gouge" of the miners—or with a massive or ribbed quartz. This latter occurs in large, lenticular vein-like sheets and varies in width from a few inches to 20 feet. The mine is systematically opened and well ventilated. Slips and offshoots are unusual, and the mine is really the simplest proposition to handle in that part of the State. With the above facts in view, the figures given by the superintendent will be comprehensible. The tonnage hoisted and milled during the year ending April 1, 1903, was 43,545 tons. The value of this in free gold (amalgam) was \$213,421.17 and in sulphurets \$48,481.83—a total of \$261,903. This represents a run of eleven months, the mill having been closed down thirty days owing to lack of electric power. The cost of mining was \$1.795; cost of development, \$0.519; cost of milling, \$0.490. Total cost per ton, \$2.804. This statement is one of the lowest as to cost that has been made on the Mother Lode of California. Reports of other mines of Amador county, showing the cost to be greatly in excess of these figures, is due to difference in conditions under which the respective mines operate. Some mines constitute all costs a charge against the ore, and while construction is really not a mining expense, it is essentially incidental, and is eventually charged against the ore. This is usually arranged for by the creation of a sinking fund to provide for deterioration, etc., but in the report of the Central Eureka such provision is not mentioned. The construction account shows an expenditure of \$20,125.65—chiefly in adding twenty stamps to the mill.

Important Decision.

The United States Supreme Court has rendered a final decision in what have become known as the "Scripper land cases," which affected the title to a large area of oil-bearing lands in the upper San Joaquin valley, in California. The decision is in favor of the original locators of the oil lands. The contestants attempted to take up this land as agricultural land by the use of "lieu land script" issued to them in consideration of the return to the Government of certain forest land which they had previously filed upon.

Previous to this decision of the Supreme Court, the lower courts, Secretary of the Interior and the General Land Office had ruled against the "scrippers." The Supreme Court decision is final and the oil men are confirmed in their title to these valuable lands. The most important point in the decision is the establishment of the fact that oil lands are mineral lands, and may be located as such under the law. Petroleum has always been considered a mineral, and the classing of petroleum-bearing lands as mineral lands is only reasonable and proper. Ex-Secretary of the Interior Hoke Smith, in August, 1896, ruled that petroleum-hearing lands were not mineral lands and could not be entered under the mining laws, and might be selected by States in lieu of lost sixteenth and thirty-sixth sections, but Congress intervened and passed an act in February, 1897, which provided that any person authorized to enter lands under the mining laws of the United States, may enter and obtain patent to lands containing petroleum, or other mineral oils, and chiefly valuable therefore, under the provisions of the laws relating to placer mineral claims. The development of oil lands will undoubtedly be stimulated in some sections by this decision, as the cloud upon the title of certain lands will now have been cleared away.

Lead Ore Assays.

In view of the considerable discrepancy often noticed between the fire assay and volumetric method of determining the percentage of lead in ores, the Colorado Scientific Society has appointed a committee of mining men to investigate the relative commercial value of the two methods of assaying lead ores. Some years ago a similar investigation was made as to the proper method of determining the copper contents of ores and a satisfactory basis was reached, and it is now thought a similar result will follow the investigation of lead assaying methods. The committee consists of C. S. Palmer, Richard Pearce, Philip Argall, W. F. Hildebrand, E. C. Woodward, E. N. Hawkins, A. W. Warwick, Henry E. Wood and C. R. Rose.

CONCENTRATES.

GOOD plaster of Paris will stand a pressure of 1000 to 1500 pounds per square inch. Its power to resist pressure varies greatly.

RECKONED at \$1 per barrel, the 1903 oil output of California would be worth more than the gold output of that State if approximating 20,000,000 barrels.

A GOOD MICA MINE can be disposed of easily. The increased use of mica for electrical purposes has made a big market for the product. Good clean large plates of mica are very valuable.

"SALT CAKE" is a commercial name given to crude sodium sulphate, and is an intermediate product in the manufacture of sodium carbonate from sodium chloride. It is employed in glass making.

It has been estimated that the gold production and life of the main reef series, Witwatersrand, South Africa, would insure a life of forty years, and at a depth of 6000 feet, worked at a lesser cost than that of the past, all of which, from present knowledge and conditions, seems probable.

In many pyritic smelting plants small amounts of coke are used to prevent the tuyeres becoming clogged or too brittle. The coke is fed around the edge of the furnace so that it sinks down with the charge and is consumed where it will be of the greatest service for the purpose intended.

Of the rock samples sent from Cambria, Cal., No. 1 is a gypsiferous marl and No. 2 a shelly marl. The six-sided crystals in No. 1 are prisms of gypsum. The yellowish-brown material in No. 2 is colored by iron oxide. Neither of these rocks are indicative of oil. Many rocks give off a fetid odor when struck.

WHEN measuring black pipe (steam or gas) it is customary to include couplings in the measurement. It is unsafe to order pipe to the exact amount required unless the order be specific and the pipe "cut to order," as pipes vary within a foot or more in length, running generally from 18 to over 22 feet in length.

IT IS not apparent what value can be found in a comparison of costs at the Alaska-Treadwell mine in Alaska, where large amounts of ore are broken in open cuts, and the cost in a mine on the Rand in South Africa at a depth of 6000 feet. The conditions in every respect are so different that a comparison from any standpoint is of no value whatever.

HYDRAULIC LIMESTONE is limestone that will make a cement that will set under water and is composed of calcium carbonate, magnesium carbonate, silica, alumina and iron oxide. Its "setting" is due to a chemical combination of lime and magnesia with alumina and silica. It is between a calcareous and argillaceous formation, is fine grained and has a splintery fracture.

LAGGING may be dispensed with in a shaft where the rock through which the shaft passes is hard and massive—there being no danger of small pieces crumbling from the wall and falling into the shaft. Where 2-inch plank is employed as lagging in a three-compartment shaft of ordinary size, the number of board feet in the lagging nearly equals that in the square timbers used in the frame.

FLUORSPAR of good grade is in demand as a flux. The mines of southern Illinois and northern Kentucky mine most of the fluorspar used in the United States, the mineral here being found in conjunction with lead. Steatite or talc, particularly of a good grade, find ready markets. The enormous sales of talcum powders for medicinal purposes has made a good talc mine a much sought for prize.

THERE has never been a known discovery of native zinc. But one report of its occurrence was ever made—that being from northern Alabama—but investigation proved the story a canard. Why nature failed to produce zinc in native state is a great mystery, and likely to remain so. One real specimen of native zinc would be far more valuable than its weight in gold, because of its value to mineral collectors.

WHEN a piece of defective fuse is found in a box, a number of pieces should be cut from several rolls and tested. If the several samples show considerable discrepancies in time, the entire lot in the box may be deemed unsafe. Many accidents are due to defective fuse, and great caution should be exercised in approaching a "missed" hole. It is always safe to allow plenty of time to elapse before making an investigation.

SYLVANITE is double telluride of gold and silver, containing more gold than petzite and less silver, its composition being 28.5% gold, 15.7% silver and 55.8% tellurium. The two minerals are easily distinguished, sylvanite being steel gray to silver white, a brilliant, beautiful mineral, having a characteristic crystalline structure, to which it owes its name of "graphic tellurium," the

arrangement of the crystals resembling Arabic lettering. It is much softer than petzite.

THE fusion of sulphides, sulphates and phosphates with reducing agents is detrimental to platinum crucibles, as heated platinum is attacked by free sulphur, phosphorus, arsenic, selenium and iodine. Lead, bismuth, tin, mercury, antimony, zinc, or their compounds, are most harmful, forming fusible alloys. Platinum vessels which have become tarnished from constant using, are best cleaned by fusing borax in and around them, or by boiling in nitric acid. They may be scoured with fine beach sand, but will lose weight more rapidly from this treatment.

THE best safeguard and protection to the investor in a mining enterprise is the honesty of the men promoting it, and the investors' intelligence and knowledge of the property. The last item can be secured by the services of one competent to make an exact report on the property. The fact that the special property mentioned adjoins a big paying mine is not considered an absolute assurance that it also would be a paying property. This fact is readily understood by mining men, but sometimes is a little hard to be seen by people who consider the subject solely from a real estate standpoint.

CALAVERITE is the telluride of gold; hessite is the telluride of silver. Hessite resembles argentite—sulphide of silver, often called "silver glance." The former contains 62.8% of silver, 37.2% tellurium; the latter is composed of 87.1% silver and 12.9% sulphur. Both are sectile, can be cut by a knife, like wax; both are steel gray to iron black in color, the silver sulphide being darker than the corresponding telluride. With hessite gold sometimes enters into its composition, so that it finally gradates into petzite, which contains 41.86% silver and 25.60% gold, combined with 32.54% tellurium. Petzite, although darker, is also steel gray to iron black in color, but it is more brittle than hessite.

LEAD occurs native sparingly in nature. No occurrence of any importance has ever been noted in America. In New Jersey, at Franklin Furnace, the zinc mines have produced a few specimens, showing very small globules of native lead, but these, as specimens, were of little value. From Sweden is obtained specimens of native lead in which the lead is in mass and readily discernible. The best mineral collections contain choice specimens of these Swedish native leads. Of late but few good specimens have been mined. Specimens showing a bit of lead weighing a quarter or half an ounce sell as high as \$15, and the demand is usually far ahead of the supply. Native lead has also been reported in Canada.

By "limerock" it is presumed that ordinary limestone is meant. It is of two varieties—limestone and dolomite. Pure limestone is calcium carbonate, and when crystallized is called marble. Composition: Calcium dioxide, 44; lime, 56. Dolomite is carbonate of calcium and magnesium. Composition: Carbon dioxide, 47.9; lime, 30.4; magnesia, 21.7. When iron carbonate is also present the rock is called ankerite. When carbonate of lime is deposited from calcareous springs it is called travertine. When deposited in caves, from dripping of water, the calcareous deposits are called stalactites or stalagmites. Aragonite is also a variety of calcium carbonate. It is distinguished from calcite by higher specific gravity and absence of rhomboidal cleavage.

CHEAP MINING is only possible where the proper conditions exist. Some of the essential features for cheap mining are a large ore body, easy ground, little or no water to contend with, cheap and abundant timber, and waste for filling abundant and easily obtainable. In reduction the ore must be easily treated, requiring no extraordinary process for its reduction and saving of values. If it is smelted an ore that is self-fluxing is preferable to one that requires the addition of flux, which means increased cost. The efficiency of the labor employed is also an important factor. Inefficient labor does not always receive the minimum of wages. Transportation and handling of ores is a matter for important consideration. Too much handling is expensive and should be avoided as far as possible.

WHERE high temperature is encountered in deep mine workings the temperature is usually greatly reduced when connection is made with other workings reaching to the surface. Where a mine is operated through a single shaft ventilation may be improved by bratticing the shaft. That is lining one or more of the compartments tightly with boards and extending the lining as close to the bottom as practicable. This results in making a "down cast" of one compartment of the shaft and an "up cast" of the other compartments. When this is done to secure improved ventilation it is a good idea to brattice the manway compartment and carry up a tower some distance above the surface. This gives an unequal height to the two columns of air in the shaft and better circulation of air results.

GYPSUM is always associated with salts found in sea water, chloride of sodium, chloride of calcium, chloride of magnesium, and sulphate of soda. Of all the solid matter contained in sea water, gypsum is the least soluble, and therefore the first to crystallize. It is thus deposited by itself, and forms continuous and regular strata, miles in extent and of great thickness. The next

ingredient that would be thrown down in the evaporation of sea water would be chloride of sodium. Some authorities believe that the oil fields of New York, Pennsylvania, West Virginia, Ohio, Indiana and Kentucky were once the bed of a great inland sea, arguing that when salt begins to crystallize from the evaporation of sea water, it forms into a cube, which sinks just below the surface of the water, and on the sides of this cube others attach themselves, thus forming a rectangular hollow, or hopper-shaped, vessel. Salt has been found in the States of Pennsylvania, Ohio, etc., in this condition, in beds of gypsiferous clay several hundred feet beneath the surface, and as it is impossible for salt to assume this shape, except at the time of crystallization in water, it follows then that that area was once an inland sea.

TESTS for tellurium in ores may be made as follows: On charcoal, a volatile white coating with red or yellow border. If the fumes be caught on porcelain the resulting gray or brown film may be turned crimson when moistened with concentrated sulphuric acid and gently heated. Tellurium turns the blowpipe flame green. Boiled a moment in concentrated sulphuric acid there results a purple violet solution, which loses its color on further heating or on dilution. In assaying ore containing gold and silver with tellurium for high-grade ore, take of ore one-half assay ton, litharge four assay tons, soda (bicarbonate) one assay ton, silica one assay ton, argol one and one-half grams, borax glass ten grams; salt cover. For low-grade ore: Ore two assay tons, litharge four assay tons, bicarbonate soda two assay tons, silica one and one-half assay tons, argol two grams, borax ten grams; salt cover. Scorch the buttons if brittle. Cupel at low heat near the end, as the button has a tendency to separate into small particles. The assayer must modify the charges to suit the particular ore he is treating. An examination of the slag and button will often suggest what change should be made if assay is unsatisfactory.

SELDOM are seen good mines advertised for sale, even in papers published in the mining districts. Yet there seems to be no good reason why this class of property should not be thus put before the buyers. The general way is for some promoter, or middle man, to get a bond on the mine and then try to sell it at a much advanced price over the original one. This system seems to be so thoroughly grafted in custom that it is difficult to change it. The reason is that the miner in the mountains cannot well personally meet the dwellers in the cities who want to buy the mines. When he comes to the city he is at a disadvantage from lack of acquaintance with prospective buyers. If, however, men get accustomed to looking in the local papers for opportunities of this nature, or in mining journals, the present system would be at least modified. The prospector or miner could be brought into immediate contact with the purchaser and the latter would get property without paying a burdensome profit to the promoter. Moreover, with largely decreased cost, many more undeveloped mines would meet with sale. Of course, the promoter system will still remain the best in the case of large properties, where the owners do not care to make generally public the fact that their mine is for sale, not caring to make public advertisement thereof. But there are hundreds of small properties or prospects known in their immediate locality to be for sale, but which outsiders never hear of. Were advertisements of such put into the proper newspapers they would be looked for and many sales made to the advantage of both parties.

THERE is a splendid demand for choice mineral specimens by mineral dealers and collectors. A fine crystallized specimen is usually worth many times its metal value as a specimen. The rare ores of lead are always in great demand, such as cerussite, anglesite, wulfenite, leadhillite, pyromorphite, vanadinite, endlicheite, jamesonite, mimetite, and desclozite. These are produced in varying quantities by mines in America. The mining man upon making discovery of any of these minerals would do well to write to a mineral dealer. Crystals of wire or spongy gold specimens always command a good premium over metal value. Crystallized specimens of antimony are eagerly sought. Kermesite or red antimony ore when in good crystals is valuable. Native amalgam is now and then found. The finder could obtain two or more times its metal value by selling it as a specimen. There is always a good demand for fine smithsonite (zinc carbonate minerals). The nickel sulphide ore millerite, when carrying the needle-like crystallizations, is in great demand. Torbernite, or uranium copper phosphate, when in bright green crystals, is most valuable. Likewise its mate, autunite, with yellow crystals, is much sought for. Vivianite, a hydrous iron phosphate, is found in a number of States. When in good crystals the mineral collector is compelled to pay \$2 to \$3 for single specimens. Manganese minerals are valued highly. Pyrolusite (manganese dioxide) in prisms brings good prices, while that beautiful mineral, rhodochrosite (manganese carbonate), cannot now be had, seemingly, at any price—that is, crystallized specimens. Small specimens of much beauty sell as high as \$50. Wavellite specimens, perfect crystals, are high-priced; \$7 is not an excessive price for a finely crystallized witherite specimen, and fine celestite specimens bring about as much. In the advertising pages of the MINING AND SCIENTIFIC PRESS will be found the names of reliable mineral dealers.

VOL. II.

SAN FRANCISCO, NOVEMBER 30, 1860.

NO. 38.

The MINING AND SCIENTIFIC PRESS is published every FRIDAY at rooms No. 7 and 8, Government House, corner of Washington and Sansome sts., by J. SILVERSMITH, Editor and Proprietor, At THIRTY SEVEN AND A HALF cents per month, or \$3 50 per annum, in advance. Advertisements, Fifty Cents per line

Washoe Items.

We find the following correspondence published in the Nevada Journal:

ESMERALDA, Nov. 11th, 1860.

It is quite warm and pleasant here, for the season, and we have not had any falling weather since my last. Parties are arriving here, daily, from California and Virginia city, for the purpose of examining the different leads, or prospecting in the neighborhood. I hear, almost daily, of new and rich leads being struck, and the opinion of all visitors is that this region of country will fully equal, if it does not exceed that about Virginia city in both the extent and richness of its mineral resources.

Yesterday was made the first *bona fide* shipment, of ore from this district. I do not know the amount of the shipment, but quite a large mule train was loaded with the precious ore from the Esmeralda lead. The last sales made of this lead were \$50 per foot—but there is no ground for sale now, at any price, nor will there be until the result of the crushing of this ore is heard from. The richness of the ore is beyond question, and there is no doubt but the returns when they do come in, will greatly enhance the price of claims.

The tunnels on the north and south of the Esmeralda claims, were commenced on the 8th inst., and are being worked night and day. The work will be completed as soon as possible; the prospects, at the present time, being exceedingly flattering. The prospecting interests are all owned by persons from your place.

VIRGINIA CITY, Nov. 14th, 1860.

All is peace and quiet here, business generally, is good, and weather fine.

The Mexican Co., expect to make a full and final start of their mill on the 20th instant. They will crush and separate by the old barrel process. They have started their machinery heretofore from time to time, to try the same. The proposed start on the 20th, instant, however will be a final one; and will be made under the most flattering expectations of success.

The mines here are turning out better than was expected a short time ago. The Chollar Company struck water on the 14th inst., and better ore than ever before. They are without doubt on the original Comstock lead. They will not be able to go any deeper with their shaft until the tunnel comes up for drainage, will be about the 1st of February next. The Osceola and St. Louis claims are paying well—mostly gold—these are now considered among the first class paying claims, and are sought for eagerly at \$40 per foot.

IMPORTANT TO THE MINERS—NEW AND CHEAP BLASTING POWDER.—Le Geni Industriel states that a patent has just been taken out in Belgium for a simple method of making blasting powder from spent tan bark. It says that while the price of this powder is less than that of gunpowder it takes but one-seventeenth part as much to produce the same effect. It is composed of 52½ lbs of waste tan bark, and 20 lbs of pulverized sulphur. The nitrate of soda is dissolved in a sufficient quantity of boiling water, and the tan bark added in a manner to completely impregnate it with the solution, after which the sulphur is added in the same way. The mixture is taken from the fire and thoroughly dried, when it is ready for use. If it is wet, it does not permanently injure it, but on being dried again is as good as ever. If fired in the open air, it causes no explosion, but is very efficient for blasting when confined in the usual manner. It is not suitable for use in guns or cannon.

Coleman's Quartz Mill.

In our last issue the type made as say that this mill would crush from six to ten tons of quartz per day, which might be considered overrating its capacity, but the inventor assures us that he will guarantee it to crush from three to five tons per day with the greatest ease. Its practicability has been thoroughly tested by experienced miners, who have certified to these facts with their signatures. We understand that the owners have received a number of orders from Washoe and other points in the interior for this mill, and are extensively engaged in filling them.

A GREAT MANUFACTURING CITY.—Manchester, England, is the greatest manufacturing city in the world. It is stated that the steam force employed in its various mills and manufactories amounts to 1,200,000 horse power. To produce this enormous motive power, 20,000 tons of coal are consumed every twenty-four hours, or 9,400,000 tons in the 313 working days of the year.

A HINT TO MINERS.—The late gale clearly demonstrated that galvanized iron pipe, for the purpose of conveying water to the mining claims, possesses immense advantages over every other method in use, as it may be laid along the surface of the ground, or buried in it, so that the wind cannot injure. It is cheaper than wooden spouting, and much more convenient.—Columbia Times.

RAILROAD MATTERS.—Chenery, Birney and Co. advertise for 60,000 railroad ties for the California Northern Railroad, Oroville and Marysville. They are to be delivered in Marysville, or on the line of the road as per contract. Sealed proposals will be received at the office of D. D. Harris, at Oroville, until Saturday, December 8th. Cash will be paid on delivery, and oak, red fir, or cedar, will be acceptable.

IN MEMORY OF GENERAL HAYEN.—The Mercantile Library Association on Tuesday evening adopted a series of resolutions of respect to the memory of General Haven, the first Vice President of the Society, and most zealous and liberal member.

General Movements of the Earth's Crust.

The general movements of the earth's crust may be classed as follows:

The Seismic or vibratory movement, which occasions earthquakes that modify the surface outline to a very slight extent, and consist of vertical, horizontal, or circular oscillations always violent and instantaneous.

Movements which affect surfaces of greater or less extent, and which are produced so gradually that to recognize their existence, the arrangement and distribution of the seas during geologic periods, must be investigated. These movements, of three varieties, are the reaction resulting from the consequent displacement of the fluid mass in the center of the globe.

Of these varieties, the first is the undulatory movement, which alternately rises and depresses the same small district, and deserves the name I give it, because contiguous to the locality which is sunk there, is another that rises, and conversely. This is the movement which we must suppose in order to explain atolls, the alteration of lacustrine and marine deposits, the accumulation of coal in coal basins, and the displacement of natural basins.

The oscillatory movement, distinguished from the foregoing by its continuance through a longer period of time, and by its affecting vast areas of the earth's surface; compared with the undulatory movement, it is what the tide is to the agitation of the waves.

The intumescent movement, which is the cause of the upheaval of continents, and distinguished from the two foregoing varieties by the persistency with which it acts. During the entire duration of the geological ages, it has been exerted upon certain specific points, which it has been continually elevating, and which thus constitute centers of upheaval. There are five of these centers in France: the central plateau, and the mountain districts of Brittany, the Vosges, the Alps, and the Pyrenees.

The orogenic movement. The arc or curvature of the regions raised by the movements just mentioned is too slight to warrant attributing the dislocations of the crust of the globe to them.

The movement that determines these dislocations is specifically characterized by the elevation of mountain chains, and which we, therefore, very properly designate as orogenic. Its tendency is to fracture the earth's crust, because its action is concentrated along lines, and is abrupt and violent in character. While the undulatory, oscillatory, and intumescent movements are produced slowly during the lapse of a geologic period, the orogenic occurs only at certain intervals, and marks the end of one epoch and the beginning of another.

AN IMPORTANT INVENTION.—Professor D. A. Woodward, of the Maryland Institute School of Design, is the inventor of the Solar Camera, an instrument which enables the photographic operator to take the picture of any object immediately, and of any size desired. It has been found useful in daguerrotypy children and animals. The London and Paris papers speak highly of the invention. A late number of the Paris *La Lumiere* says:

"At the last meeting of the French Photographic Society, Count Aguado presented several pictures obtained by means of Woodward's Solar Camera, and representing animals, taken instantaneously on quarter plates. It is impossible to produce anything more perfect of this kind. Animal painters after this must despair. There was, in particular, a front view of a cow, with the body foreshortened, and the head erect, which makes the most charming picture that can be imagined. It is so full of life that you expect every instant to see the animal walk out of the picture."

The London *Photographic Notes* thus winds up a long and interesting notice of Prof. Woodward's Camera:

"The introduction of the Solar Camera, by the ready means it affords of producing life-size portraits from small instantaneous negatives, will no doubt effect a revolution."

PRESS has some item of interest. Each volume is a milestone, as it were, marking the stations along the road of progress. As discovery after discovery was made in mining or metallurgical practice—not then reduced to a science as now—this paper chronicled each in its turn. Following is another of the many items of interest:

"It has been discovered, near Placerville, (Cal.,) that hard clay or cement can be profitably crushed, very much after the fashion of quartz. The cement

mill resembles, but is not entirely like, that designed for quartz. The stamps are lighter and the batteries, instead of discharging the crushed earth on one side, discharge on both sides, thus doing double the work in the same time that it could be done in the ordinary quartz mill."

The above is probably the first mention in the press of the double-discharge mortar, which afterward became popular with silver miners, where the amalgamating was mostly done in pans.

The first labor union in San Francisco, Cal., was organized May 4, 1861. The MINING AND SCIENTIFIC PRESS of May 11, 1861, says of this: "On Saturday last the laborers of the city held a meeting and resolved to work no longer for the ruling rate of wages, viz: \$2 and \$1.75 a day for the ruling rates of time, viz: twelve hours. They consider their services worth \$2.50, and that they should not be obliged to work longer than ten hours every day. The society is organized under the name of the 'Laborers' Protective

MINING AND SCIENTIFIC PRESS.

Our Artistic Heading and New Dress.

herewith, to our numerous patrons, a new face in artistic heading to the MINING AND SCIENTIFIC design is one that must be admired and appreciated for its beautiful execution, style and design. Com- science, Agriculture and Mining are simultane- d with Archimedes pondering over problems. al, the renowned artist of California, pre- ng, and Mr. Armstrong, of Eastman, Loomis the engraver. We feel proud of this head- aps, the best piece of work ever turned

ense expense, purchased new type and of doing our own work, hence its ance. In point of matter, we are n the State, and of such matter f the most important and vital ture, Manufactures, Arts and o execute all job-work and in, or fancy, at the lowest drawings and sketches are s, in the Union. The thanks for the patron- half of this pub- which has for

\$2,500 REWARD.—The Publisher of this journal is hereby au- thorized to offer the above reward to any persons who will place in his hands a successful mode or process for separating the gold from the sulphurets as found in the mines of this State. The reward will be paid in cash, at once, after the tests and experiments shall have been satisfac- torily proved.

The above notice, which has been published by us in the PRESS, has received attention from many of our metallurgists and chemists. A few, however, are in doubt as to the genuineness of the offer. We have to this effect several com- munications from different parts of this State. The pub- lisher hastens to inform those interested to explain, and stip- ulate more particularly the requirements to be complied with. Previously, however, an additional premium is hereby offered, making the reward \$5,000 instead of \$2,500. *The process sought is a successful mode for extracting the various metals, but more especially Gold and Silver from the native Sulphu- rets as found in California.* The treatise should be, how- ever, founded on a paying or remunerative basis. The ma- terials, labor or other expenses in the process should not ex- ceed the value of the metal sought. We have hinted a few suggestions to those who experiment in this process; had we the conveniences we should succeed in discovering this pro- cess. In France, England and Germany sulphurets are smelted. But that process is, doubtless, too expensive in this country,

Fifty Dollars Premium.

The publisher hereby offers fifty dollars for the best writ- ten article on the ORIGIN, DISCOVERY AND SYSTEM of Mining the Pacific Coast. The same to contain correct dates ts, localities, names, etc., not to occupy more than the Press. The above sum will be hall have been print- inferior

ners of Dutch Fl: duction of the pr cents an inch

Union." The issue of Sept. 7, 1861, contains the first description of the Plattner process, as it was originally practiced at Frieberg, Baden, Germany. The process differed materially from the process bearing that name to-day.

A hundred other of the early issues of the MINING AND SCIENTIFIC PRESS might be taken up and some interesting paragraph or article taken therefrom; but it is unnecessary. As one turns the pages of these old files, the advance of time sees every new idea, every new application and each new device for the improvement of mining and metallurgical processes chronicled therein. It was then, as it is to-day, promptly to the front with everything that was newest and best in mining. Originally a local paper, circulating principally in California, it has been continually reaching out, until the MINING AND SCIENTIFIC PRESS is known throughout the entire world, and letters received from every country where mining is in progress attest the value and esteem in which it is held by those foremost in the mining industry. No better comparison of the character of the paper and the times can be found than the repub- lished pages of the early editions of the MINING AND SCIENTIFIC PRESS which appear in this issue, and a glance at the contents of the same journal during the past six months. In these pages are found articles contributed by the leading mining engineers of the day, and representatives of mining and metallurgical practice in every part of the world. Following are some of the titles:

"Electric Power for General Mining Purposes;" "Use of Crude Oil in Smelting;" "Steel vs. Timber in Mine Shafts;" "Mine Timbering by the Square Set System at Roseland, B. C.;" "Cyaniding Silver Ores;" "A Dry Process for the Treatment of Com- plex Sulphide Ores;" "A Study of Amalgamation Methods With a View of Avoiding the Loss of Mer- cury;" "Use of Lime as an Alkaline Reagent in Cy- aniding;" "Stamp Milling and Amalgamation of Free Gold Ores;" "Precipitation of Copper Cyanide Solutions;" "Concrete Foundations for Stamp Bat- teries;" "Strength of Materials in Mines;" "Sil- ver Mining and Smelting in Mongolia;" "Winding Plants for Great Depths;" "Boring the Tundra of the Nome, Alaska, Gold Fields in Search of Gold;" "The Permanganate Process for Extraction of Gold from Chlorination Tailings;" "Treatment of Home- stake, South Dakota, Ores;" "Concentration in Cornwall, England;" "Pyritic Smelting;" "Copper Mining in Upper Michigan;" "Elimination of Antimony, Lead and Zinc from Copper Mattes;" "Milling at the Camp Bird Mine, Colo.;" "Late Improvements in Copper Smelting;" "Stopping With Machine Drills;" "Gold Milling Practice in Bendigo, Australia;" "Oil Concentration of Sulphides;" "Separation of Gold from Copper;" "Ore Treat- ment at Mt. Lyell, Tasmania."

These are but a few of the numerous technical articles published within the past half year, and many of them were written specially for the MINING AND SCIENTIFIC PRESS. What may be found in the pages of the MINING AND SCIENTIFIC PRESS within the next forty-three years can only be conjectured. Never

has there been an age in history when progress was so rapid as now. Human thought is far reaching, its conceptions are unlimited, and in these days to think is to act, and innovations as startling as any changes of the past are promised for the future.

Ore Treatment at Mt. Lyell.*

NUMBER III—CONCLUDED.

SUBSIDIARY PLANTS.—An important adjunct to the company's reduction works is the coking plant it possesses at Port Kembla, near Wollongong, New South Wales. This consists of sixty-two ovens of longitudinal horizontal type, 24 feet long by 3 feet 6 inches wide by 5 feet 4 inches high, with circulating gas flues, and a capacity each of about ten tons of coke per week. The works are supplied with com- plete grinding and elevating machinery, hydraulic handling apparatus, including coke pushing machine, and all other necessary paraphernalia, hringing the installation up to date. The small coal used is from the Mount Kembla mine, and prior to grinding for coking is dressed by washing machinery to remove the slate. The coking plant supplies the entire re- quirements of the reduction works, which, in view of the small consumption of coke due to the peculiar method, are comparatively light, and fall below 350 tons per week for the treatment of 7000 tons of metal-bearing material. An excess of output is dis- posed of by sale.

The limestone is napped to a coarse size only. The quantity of stone supplied by the silica quarry from January 1, 1898, to June 30, 1902, is 316,563 cubic yards of crushed, for furnaces, and 12,930 cubic yards of fine, for converters. The output of the limestone quarry for the same period was 155,451 cubic yards of broken rock. Explosives used on silica, chiefly black powder; on limestone, chlorate-nitrobenzol compounds. Typical analyses of these two barren fluxes are the following:

FLUX.	Silica		Iron Oxide		Alumina		Carbonate of Magnesium		Carbonate of Lime	
	%		%		%		%		%	
Quartz flux, white.....	91.44		1.54		3.09		
Quartz flux, dark.....	88.72		3.60		7.03		
Limestone, grey.....	10.92		.57		2.88		3.00		83.40	
Limestone, black.....	3.26		.85		.86		trace		95.10	

In addition to using the South Tharsis and Royal Tharsis metal-bearing fluxes, the company has lately reverted to the more extensive use of barren quartz flux, chiefly on account of the slackening of deliveries of siliceous ores by the neighboring mines. The supply of natural silica is inexhaustible, for one of the principal rocks of the district, which occurs in very

*From the report of the Secretary of Mines, Tasmania

massive deposits right on the spot, is quartzite, and, failing this, an equally inexhaustible supply of con- glomerate would have been available.

The limestone, though not very pure, serves all purposes for copper smelting, and also makes a good burnt lime. For the latter there are two kilns at the quarry, 18 feet high by 6½ feet diameter. Both quarries continue to constitute the lucky factors, hy way of fluxes, which made their presence, in such close proximity to the smelting works (60 chains), so valuable to the company. The same is also true of the clay deposits in the immediate vicinity of the smelting works which have supplied all the bricks used in the construction of the works (4,000,000), and which the company utilizes for the manufacture both of ordinary bricks and firebricks. The quality of the firebricks is quite equal to ordinary Australian makes, and the price of production considerably cheaper than the local cost of the imported varie- ties, so that the company has given up the use of the latter.

The following table shows the cost of treatment of ore, as collected from the company's half-yearly reports:

HALF YEAR ENDED	Mining		Overburden removal		Smelting		Converting		Total	
	s.	d.	s.	d.	s.	d.	s.	d.	£	s.
March 31, 1897 1	8.27	0	18	1.64	3	10.39	1	5	8.30	
Sept. 30, 1897. 1	4.88	2	0	16	2.44	3	7.78	1	4	3.10
March 31, 1898 2	4.64	2	0	17	9.87	2	9.18	1	4	11.69
Sept. 30, 1898. 2	5.83	2	0	16	5.31	2	5.33	1	3	4.47
March 31, 1899 2	3.66	2	0	16	3.61	1	11.19	1	2	6.36
Sept. 30, 1899. 2	5.31	2	0	17	10.45	2	2.15	1	4	5.91
March 31, 1900 2	11.76	2	0	15	10.70	2	2.30	1	3	0.78
Sept. 30, 1900. 3	5.00	2	0	14	11.89	2	0.29	1	2	5.18
March 31, 1901 3	1.40	2	0	15	9.65	2	1.16	1	3	0.21
Sept. 30, 1901. 2	6.86	2	1	14	8.04	2	0.45	1	1	4.35
March 31, 1902 2	3.89	2	1	14	8.17	2	2.15	1	1	3.21

It has to be remarked that the overburden charge is a nominal one, debited against the winning of ore, irrespective of the actual cost. This charge was determined once for all, when the programme for open cutting was made out, in such a manner as to even up the average of the cost over the total quantity of ore to be extracted. Otherwise the later days of the open cut, when the amount of overburden to be removed per ton of ore would be considerably in excess of what it was in the initial stages of the work, would then oblige the ore to suffer an extreme charge in this respect.

The item of mining comprehends the usual com- plete working expenses, including supervision and management, also the delivery of ore from the open- cut benches to the mine ore bins and similar expenses attendant on or subsequent to excavation, until the smelting department receives the ore. The figures are, therefore, swelled by expenses not necessarily of a mining nature.

The item of smelting similarly comprises the usual

essential costs attaching to the operation itself, such as labor, coke, supplies, stores, hot blast, supervision, electric light, etc., beginning with the sampling of the ore and concluding with the second smelting to converter matte; but it also includes the carriage of the ore from mine bins to smelter storage bins over ropeway or haulage line, the cost of wining and delivering all barren and mineral-bearing fluxes, the maintenance of plant and buildings, the pumping of water supply, all motive power costs, collection and retreatment of flue dust and other middle products, both from the furnaces and convert-

and electrical engineering and languages. Several special lectureships and associate professorships have also been established. Particular emphasis is to be placed upon the study of mining law.

The Cripple Creek Drainage Tunnel.

Written for the MINING AND SCIENTIFIC PRESS by
W. B. WILSON, E. M.

Operations on the drainage tunnel at Cripple Creek, Colo., began early in January of this year,

veyed in pipes over the surface to the workings down the hill, and everything is arranged very conveniently for rapid work.

It is not proposed at present to extend the tunnel any farther than is necessary to reach the main water courses in the eruptive mass occupying the central portion of Beacon hill, as it has been thoroughly demonstrated by the Standard tunnel that all that is necessary to drain the waters from the mines of Raven and Gold hills is to tap the water courses in Beacon. The completion of the tunnel is anxiously looked forward to by all interested in the district,

The Drainage Tunnel, Cripple Creek, Colorado.

ers, all cost of transportation of raw and middle products between the furnace plants and the converters, and, in fact, all incidentals of an operating nature, to which are added cost of laboratory work, telephones and signals, stationery, and general office expenses. Converting is treated with similar fullness. The only item not included in the above figures are London and Melbourne head office expenses, which are slight compared with the rest of the outlay, as well as depreciation of plant. All three departments, moreover, pay the company's railway the usual rates above actual cost of transportation, thus leaving that branch of the company's enterprise a profit. It is, therefore, apparent that the actual mining and smelting costs—i. e., the winning and treatment—as such, are lower than these more comprehensive figures indicate. The cost of shipping and realizing on blister copper is, of course, not included, this not being a local cost.

The mine, smelter and railway departments deal with each other financially as entirely independent concerns, and accounts separately to the Melbourne head office for all transactions. The mine, however, is not treated as selling to the reduction works the ore which it supplies—i. e., the monetary value of the ore is disregarded. This would, under the circumstances, only be a very necessary complication.

The wages paid by the company during the last three years, in the whole of the departments—i. e., mine, reduction works, railway and coke works—have averaged £263,326 per annum.

The number of men employed during the four quarters of the year is reported as follows:

WHERE EMPLOYED	Quarter ending Sept. 30, 1901.....	Quarter ending Dec. 31, 1901.....	Quarter ending March 31, 1902...	Quarter ending June 30, 1902....	Average
Mt. Lyell mine.....	419	426	344	326	379
Other mines.....	46	42	52	50	47
Reduction works.....	1,221	1,300	1,300	1,288	1,277
Railway.....	235	225	220	207	222
Total.....	1,921	1,993	1,916	1,871	1,925

New Mexico School of Mines.

At the New Mexico School of Mines the work of mining engineering will be specialized along three distinct lines. These are the mechanical, the metallurgical and the geological. The last mentioned will form a somewhat new departure in this country and will be known as the special course of the Geology of Mineral Deposits. It will be under the supervision of President Keyes. There will be four instructors in the geological department of this institution.

Scholarships in mining to the number of fifty have been established. The awardment will take place at the beginning of the next semester, early in September next.

There have recently been established at this school the departments of mineralogy and petrography, mining, mechanical engineering, metallurgy, physics

and during the four months which have since elapsed some 2600 feet of tunnel has already been completed. This remarkable rate of progress has been accomplished in the following manner: Beginning at the portal work proceeded in the usual way, but on account of the wash and slide rock encountered only about 82 feet was driven during the first month. About 500 feet from the portal and on the line of the tunnel a shallow shaft 39 feet deep was sunk to the grade and a heading started each way. Then at a point 2300 feet from place of beginning, shaft No. 2 was sunk to a depth of 210 feet and two other headings started off. This shaft was completed last month and work has been vigorously prosecuted since then, some 360 feet or 180 feet in each heading having been driven during the present month. Some 4300 feet from the portal the old El Paso shaft penetrates the line of the tunnel, and with 694 feet of levels already driven, the new tunnel having been surveyed to connect with these workings. These levels have been widened and brought down to the regular tunnel grade and two headings are being rapidly driven. The work is now divided as follows: One heading from the portal, which is now in 1000 feet; two headings from shaft No. 2, 360 feet in all, and two headings from the El Paso shaft, which now have a total length of 1252 feet, making 2602 feet altogether, 1908 feet of which is new work. The rate of progress now is a little better than 30 feet per day, or 900 feet per month, and as the combined distance still to be driven from the various headings before the contact can be broken into is 3200 feet, if the present headway is kept, they should be tapping the water on or before Sept. 1.

It is not likely, judging from the experience of the Standard tunnel, that a very large flow will immediately be struck on entering the eruptive rock, but that from 500 feet to 600 feet farther will have to be driven before the tunnel will begin performing its full duty in the way of giving rapid drainage.

In the accompanying rough sketch there is a great difference between the contact line in the Standard tunnel and in the new drain tunnel. This is apparent, only not real, and is caused by the difference in the hearings of the two tunnels.

The financing of the work was accomplished by the subscribing of the amounts opposite the names of the following concerns:

El Paso G. M. Co.....	\$25,000
Elkton G. M. Co.....	15,000
Mary McKinney G. M. Co.....	15,000
Doctor-Jack Pot G. M. Co.....	5,000
Anaconda G. M. Co.....	4,000
Work G. M. Co.....	1,500
Anchorage-Leland G. M. Co.....	2,500
Moon-Anchorage G. M. Co.....	1,500
Midget G. M. Co.....	1,500
C. K. & N.....	3,500
Taylor & Brunton, sampling works.....	1,000
Tutt, Penrose & McNeill.....	2,500
Midland Railway Co.....	2,500
Sale of water right.....	5,000
Total.....	\$85,500

The contract for driving the tunnel to the contact was let to the El Paso Mining Co. at an average price of about \$14.50 per foot. They having the equipment right on the ground permitted their making a very reasonable bid. The compressed air from the compressor at the El Paso shaft is con-

and there can be no doubt of the great benefit which will be derived from it when the water begins flowing out of its portal.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 12 1903

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

CALCINING OR DECOMPOSING FURNACE.—No. 726,911; W. Hasenhach, Mannheim, Germany.

Calcining or decomposing furnace comprising iron framework, hollow casting mounted on framework for supporting muffle and serving as bearing for shaft of agitator, muffle supported on casting and having inner hub, agitator within muffle provided with hub fitting over hub of muffle, shaft for agitator having bearing in hollow casting, and means for operating agitator.

ROTARY ORE CLASSIFIER.—No. 727,973; J. Klein, Desloge, Mo.

In ore classifier, hopper having ore inlet and sludge outlet, water inlet arranged to discharge stream of water in horizontal plane at distance above bottom of hopper, air pipe arranged to discharge stream of air laterally of and into stream of water from water inlet, annular amalgamating trough in plane above water inlet, pipes extending outwardly from trough at various points in circumference, amalgam cups connected with pipes, and

amalgamating plates located above trough with lower ends terminating adjacent thereto.

AMALGAMATING DEVICE.—No. 726,997; G. C. Scott, Columbus, Ohio.

Combination with ore pulp receiving vessel having offset or well in lower side adapted to contain body of mercury, amalgamating bodies contained within vessel, movable support for amalgamating bodies above vessel and means connected with support for raising and lowering amalgamating bodies independently.

HOPPER CAR.—No. 727,616; J. M. Hansen, Pittsburgh, Pa.

In metallic car body, combination with side plates, of cross-hood consisting of two downwardly diverging plates provided with abutting flanges at upper edges, connection plates secured between abutting flanges, connection plates secured to side plates of car, and inclined ties secured to connection plates on sides of car and connection plates of cross-hood.

STAMP MILL.—No. 727,809; C. C. Lane, Los Angeles, Cal.

Stamp mill for crushing ore comprising frame, shaft mounted in top thereof, crank-arm on shaft, pitman connected to crank-arm, vertical guide connected to pitman, spiral guide rotatably connected to vertical guide, resilient gripping prongs affixed to spiral guide, having catches on inner faces, and out-

wardly and upwardly turned release hooks on lower ends, release bars affixed to frame, adapted to contact with release hooks, release stamp therefrom on upward movement, stamp head having at one end upwardly projecting stem provided with conical head and removable shoe in end opposite stem, and mortar having removable die projecting through bottom thereof, means to support and adjust die to compensate for wear.

GRAVEL OR SAND DREDGE.—No. 727,632; R. Hosford, Lebanon, Ind.

Combination two suitable frames, driving wheel mounted on one, idle wheel mounted on other, and dredge and conveyor structure composed of open links 25 and 26 mounted thereon, links 26 being wider than links 25 one end and having inclined cross members whereby they are enabled act as buckets in dredging and conveying operation.

EXCAVATOR.—No. 727,656; W. E. Maloney and P. J. Maloney, Worcester, Mass.

In excavator or power shovel, combination of boom or arm, bucket, hoisting tackle connecting bucket with end of boom, carriage longitudinally movable on boom for swinging bucket, and gearing housed in carriage for tipping bucket.

HOT BLAST STOVE.—No. 728,185; J. Kennedy, Pittsburgh, Pa.

Hot blast stove having lower annular flue with

central arch containing cross flue connecting opposite sides of annular flue, central combustion chamber with lower end over arch, gaseous inlet and hot-blast outlet leading into lower end of combustion chamber, radial checker work around combustion chamber and opening downwardly into annular flue, flue having chimney outlet and cold-blast inlet leading into it.

ORE CRUSHER.—No. 727,958; J. A. Johnson, Los Angeles, Cal.

In ore crushing machines, frame end thereof provided with dovetailed groove, crusher bed having dovetailed tongue adapted to be removably secured to end of frame, drive shaft mounted in frame, arm secured to shaft and having dovetailed slot therein, movable jaw removably fastened to arm, adjusting rod adjustably mounted in frame, spring detachably connected to rod and to rear face of arm and means adjustably connected to rear end of frame, limiting rear movement of arm.

ORE SEPARATING AND CONCENTRATING APPARATUS.—No. 727,997; F. E. Parker, Kansas City, Mo.

In ore separators, combination with main, elevated, longitudinally extended receptacle or trough for reception of material to be separated, having perforate bottom and perforate sliding, feed-regulating plate within and upon upper surface of bottom of receptacle, perforate material-conveyor box in main elevated receptacle, means for operating conveyor, water spraying pipes on each side of main receptacle, and suitable water deflecting plates beneath pipes. Reciprocally traveling table, pendent material removing devices in path of upper surface of table, and suitable hanging supports therefor, and devices actuated alternately by table in its to-and-fro movement coating with material removing devices and imparting intermittent motion thereto transversely to line of direction of movement of table.

METHOD OF EXTRACTING NOBLE METALS.—No. 727,659; F. W. Martino, Sheffield, Eng.

Recovering gold from cyanide solution by acidifying solution and treating it at raised temperature with barium sulpho-carbide.

Head-Works Framing—Primary Notions.

Written for the MINING AND SCIENTIFIC PRESS by
CHARLES H. FITCH.

If we have over a shaft a rectangular tower of timbering having four legs or struts, and assume it to be centrally loaded with 80,000 pounds, each corner post will take one-fourth of the load—that is, 20,000 pounds.

A skeleton sketch of such a tower is shown herewith, sides at top 6 feet and 12 feet, at bottom of sec-

ond section 7 feet and 14 feet, with sections 15 feet high.

This gives the corner posts a batter or inclination of practically 2° from the vertical. The vertical load being 20,000 pounds, the slightly inclined post will take that load; but the stress caused in the post will be greater than the load. The stress in the inclined strut or post will be equal to the load into the secant of 2° , which will be a little (less than 100 pounds) more than the load of 20,000 pounds.

The stress will, however, be more than the vertical load, and, if the strut were more inclined, the excess of stress would be much greater. A toggle joint furnishes a practical illustration of this, as it has links which assume variable angles with the direction of pressure applied to them, and, as these angles become oblique, the stress in the links and the pressure which they exert become very great, which fact gives value to the construction as a machine detail for stone crushers, presses and the like. This stress varies as the secant of the angle with the direction of the original pressure taken as a unit or denominator.

If we make a right-angled triangle, in which the vertical pressure of 20,000 pounds is represented by the vertical side, and draw the line of direction of strut (2° from the vertical or other angle, as the case may be), until it intercepts the horizontal side, the hypotenuse or oblique side will represent the stress in the strut. When we call it the secant this is what we mean.

The horizontal line will represent a stress needed to balance the triangle of forces. Whatever the angle be it is called the tangent, and we find these dimensions for any angle or pressure by referring to tables of natural circular functions and multiplying the ratios found by the pressure, load or stress which is made up by other stresses in members, taking the directions of secants and tangents.

If we had a member of the frame in the position of the tangent, we would thus have observed the stress in it, as well as in the strut, and we would have to provide a section of timber to meet the strain.

But our frame has no member in the direction of the tangent of the angle of inclination of the strut with the vertical. If we draw such a tangent, it is the projection vertically downward of the inclined strut upon a horizontal plane. The structure has no such line, but joining the corner posts at the top are horizontal members which hold them together. It is easy to see that some of the vertical load applied to each inclined corner post comes upon the adjacent horizontal members. The stresses in them are small; but if they offered no resistance the strut would fall over. There is a push on both of these members, and there is nothing else to take this push. It is exactly represented by the tangent which we have already laid out.

We have already determined the value of that tangent in pounds load, and we have its direction. If we now lay off a line parallel with one of the horizontal members from one end of the tangent, and a line parallel with the other horizontal member from the

other end of the tangent, a new triangle will be formed, in which the triangle will be the hypotenuse. The lengths of the sides will give the stresses in the horizontal members at top due to each corner load. These we obtain in figures, which save us from laying off and measuring by using tables of sines and cosines.

In the tables of secants and tangents one side of a right-angled triangle is taken as the unit. In the tables of sines and cosines the hypotenuse of a right-angled triangle is taken as a unit.

In the case of the tower sketched, one of the top members makes an angle of $26\frac{1}{2}^\circ$ with the tangent. Stresses are as follows, due to each vertical corner load:

- In strut—
 $20,000 \times \secant 2^\circ$.
- In one horizontal member at top—
 $20,000 \times \tangent 2^\circ \times \sin 26\frac{1}{2}^\circ$.
- In the other—
 $20,000 \times \tangent 2^\circ \times \cosine 26\frac{1}{2}^\circ$.

These latter stresses, due to two-corner loads, figure out at about 600 pounds and 1400 pounds, respectively.

We have to provide cross-section of timber enough to meet all the stresses coming upon a member. For the next lower section the weight of the section above it must be figured; but the foregoing indicates the method of locating stresses and members to withstand them by the triangle of forces. If we have a pressure in one direction coming upon three members in as many directions, it is a simple matter of measuring the angles and determining the stresses by use of tables of circular functions.

In any framing a pressure is resisted with greatest economy of material by a strut in direct line with it; but as the framing usually needs to leave center lines for other purposes, and because a variety of pressures have to be considered, the lines of framing are usually placed at some disadvantage with reference to the direction of any particular pressure considered.

For example, besides the weight pressures, we have often to consider wind pressures. These are relatively much lighter in most cases; but, because the framing members of a structure are usually placed to resist the loads of weight chiefly, their direction is unfavorable for resistance to wind pressures. Hence it is often found that these minor wind pressures create very heavy pressures in some members not favorably placed to receive them, which stresses, all the same, have to be carefully provided for by increasing the dimensions of such members.

A straight line is the shortest distance between two points, and, in carrying a stress between two points, indirection involves additional size and strength.

The calculation of stresses in tower frames is less easily grasped than calculation of elements of bridge trusses, because they are in space of three dimensions, instead of being in a plane of two dimensions. Hence, they must be calculated in two planes at right angles. This is easily seen by using a card model showing the lines as edges of the card, and bending the card to show the planes.

I have made these primary explanations in the attempt to give some practical understanding of the stresses in tower frames to anyone who has not studied trigonometry, and as a prelude to further explanations. Tables of secants, tangents, sines and cosines may be found in many books—usually in any engineering pocketbook. The angles may be laid off and measured with a protractor.

Safe loads for yellow pine struts are:

	8"x8"	10"x10"	12"x12"
	Pounds.	Pounds.	Pounds.
12 feet long.....	60,000	100,000	140,000
24 feet long.....	40,000	80,000	120,000

By allowing a strength about proportional with the square inches area of cross-section, and using reasonable lengths of timbers, a pretty good approximation to the sizes required can be had for any ordinary case. This may prevent the use of the needlessly heavy timbers often seen in head-works, and will have a basis of good theory and not be mere guesswork.

Electrolytic Refining of Gold.

Dr. D. K. Tuttle gives an illustrated description in the January impression of *Electrochem. Industry* of the Wohlwill process of gold refining used at the Philadelphia United States Mint. The feature of the process is the electrolyte, which is composed of a gold trichloride solution, rather strongly impregnated with free hydrochloric acid; the latter addition is necessary, because if a gold anode be placed in a neutral or only slightly acid solution of gold chloride, gold will be deposited on the cathode, but little or no gold will be dissolved from the anode, free chlorine being given off instead. The temperature of operation is 50° to 55° C., this increased temperature serving to reduce the voltage required, and at the same time to diminish the amount of free acid necessary to suppress evolution of chlorine at the anodes. Circulation of the electrolyte is also necessary. The cost of the hydrochloric acid required in the bath is 20 cents per 1000 ounces of deposited gold. Any platinum present in the bullion can be recovered; it dissolves, but is not deposited with the gold. When the electrolyte becomes sufficiently

charged with platinum, the gold is first precipitated by sulphur dioxide and reserved; then the platinum remaining in solution is separated as ammonium-platinum chloride; lastly the copper is recovered by passing the wash waters over iron scrap. He does not treat by this process bullion having a fineness of less than 940 gold.

The Commercial Assay of Lead Ores.*

Written by A. W. WARWICK.

No one familiar with the methods in vogue for the commercial assay of lead ores can feel at all satisfied with them. The fire assay is so inherently inaccurate that it is a wonder that the sellers of such ores have not made an organized resistance to the valuation of lead ores by such a method. It is utterly unscientific, and it seems to some members of the Scientific Society that it might well be the subject of investigation by us.

It is, of course, well known by the members of this Society that two methods of lead assay are practiced in the West: the barbarous fire assay—a relic of the times when Paracelsus and other alchemists were leading lights of science—and the volumetric method, based upon the precipitation of ammonium molybdate, and known sometimes as Alexander's method. This latter is an excellent one, being rapid and accurate enough for all commercial purposes.

Both these methods are being used by the smelters, care being taken, however, to use the method which gives the lowest results. Thus, the ores of Brece hill and the Lillian mine are assayed by the volumetric method, on account of the ores (containing bismuth) giving lower results than the fire assay. All other ores are purchased on the valuation set by the fire assay.

It is notorious that the fire assay for lead ores becomes increasingly inaccurate as the ores become more complex and of lower grade. Thus, ores containing 8% of lead, by chemical analysis, may not show more than 4.5% to 5% by the fire assay—an error of about 40%. The writer has caused a number of comparative tests to be made as to the results obtained by both methods of assay, and the figures are decidedly interesting.

The ores assayed from 5.7% lead to 20.6% by the volumetric process, and the composition of the ores treated had analyses which varied between the limits given below:

	(1)	(2)
Pb.....	5.7.....	20.6
Zn.....	10.1.....	23.8
Fe.....	5.0.....	8.4
SiO ₂	64.2.....	27.8

The analyses gave the following comparative results by volumetric and fire assays:

	Volumetric.	Fire.	Difference.
1.....	6.4.....	4.8.....	2.1
2.....	5.7.....	3.8.....	1.9
3.....	10.1.....	8.6.....	1.5
4.....	10.5.....	9.5.....	1.0
5.....	12.6.....	10.9.....	1.7
6.....	10.7.....	7.8.....	2.9
7.....	20.6.....	17.6.....	3.0
8.....	9.8.....	6.3.....	3.5
9.....	7.4.....	4.8.....	2.6
	10.4	8.3	2.1

It will be noticed that the difference between the fire and volumetric assays vary so greatly that it amounts to a farce to call the fire assay a determination of lead.

It is not, however, merely a question of a loss of 2.1% of the lead contents that is involved, but also the entire contents of certain lots, viz.: 1, 2 and 9, these being below the specified amount of 5% paid for by the smelter. As usual, the ores which need the most consideration get the least.

The smelter men argue that the assay gives the yield that is obtained in practice, and therefore it is a fair method of valuation. This is absolutely false. Some of the members may recollect that the smelters brought forward a similar argument when the question of copper assaying was a live one, some ten or twelve years ago. It was proved to be incorrect for copper, and the writer, for one, believes that the same is true for lead. As a result of the copper debate the smelters were forced to yield, and a rational process of assaying that metal was adopted.

It may be interesting, however, to point out that the prices paid the miner for the lead contained in the ore are so low that the profit of the sales by the smelter must more than cover any loss. For example: On ores assaying 5% to 10%, fire, the price paid by the smelter is 25 cents per unit, or 1.25 cent per pound. The smelter gets 4 cents per pound, and hence he has 2.75 cents per pound to cover refining and transportation to New York. This presumes, of course, that he only gets as much out of the ore as the fire assay shows. On the actual lead contents of the ores bought by the smelters he may pay as little as 0.7 cent per pound, leaving the difference of 3.3 cents to pay for the losses, as well as the other items mentioned.

* Proceedings of the Colorado Scientific Society.

New Plant of the Royal Consolidated Mines Co., Ltd., Hodson, Cal.

Written for the MINING AND SCIENTIFIC PRESS by
HORACE F. BROWN, M. E.

This plant, now nearing completion, represents the growth of the mining industry of California to a notable degree. The old plant of forty stamps has a record for successful work.

The recent improvements consist of a modern 120-

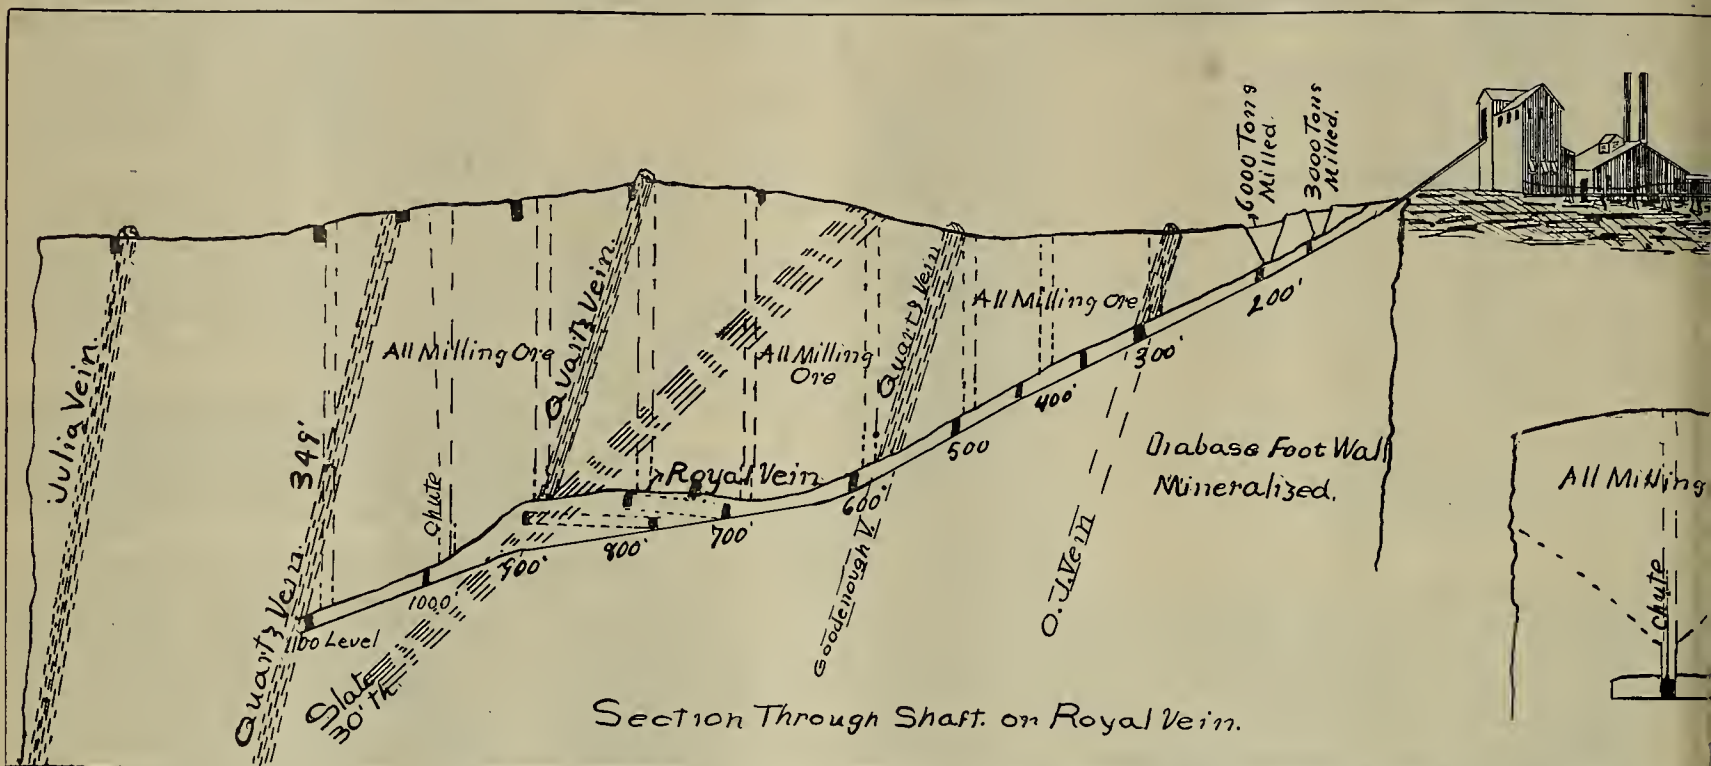

a capacity of four tons and weighing 3700 pounds, are provided for tramping the ore to the mill. These cars are operated by an electric mine locomotive, trolley driven, which gives a capacity of about 100 tons per hour. The locomotive is provided with a headlight and the whole plant is electrically lighted, so that ore can be delivered either night or day if required.

The tramway consists of trestle work, starting from grade from the crushing plant, running up an incline of 1½% to the top of the storage bins in the mill. The maximum height of the tramway is 54 feet;

2 feet 6 inches thick, 12x12 feet square, built on solid rock. The mortar and battery bolts pass entirely through the concrete base to heavy anchors.

The battery frame is tied to the framing of the ore bin, as shown in the cross section of the mill herewith, making an exceedingly rigid and substantial construction. Each battery is also fitted with copper plates 52 inches wide by 24 feet long. This length is somewhat excessive, but it has been adopted by reason of long experience on the ore of the Royal mine.

The mill and crushing machinery were furnished by

Cross-Section Royal Con. Mine, Hodson, Cal., Showing

stamp, wet-crushing gold mill, a new crushing and hoisting plant at the mines and an electric tramway from mine to mill.

The hoisting plant consists of a powerful double-drum hoist, operated by two 12x14 high-pressure engines, having a hoisting speed of 800 feet per minute, the skip having a capacity of four tons. The ore is dumped directly to the hopper of a No. 7½,

average height, about 38 feet; length, 1600 feet. The track is of 30-pound steel rail, 24-inch gauge. The cars enter the mill near the apex of the roof and discharge to double-storage bins below, which have a capacity of about 1000 tons.

The mill is located on the crest of a ridge 1600 feet from the collar of the shaft and about 15 feet below the level of the same.

the Allis-Chalmers Co. of Chicago, Ill., and represents all of the latest improvements in stamp mill construction.

The concentrating machinery consists of twenty-four Standard tables, furnished by the Llewellyn Iron Works of Los Angeles, Cal., and twelve belt concentrators, for second concentration, of the vanner type. All of the middlings from the twenty-four Standard

Royal Con. 120-Stamp Mill, Hodson, Cal.

style D, Gates gyratory crusher, where it is all crushed to pass a 2½-inch ring. This crusher has a capacity of 125 tons per hour. All the ore from the primary crusher passes through a revolving screen, where all of 1-inch cube and under is taken out, the balance going to two No. 4½, style D, Gates crushers, where it is all reduced to 1-inch cube or less, all of the material, when reduced to the proper size, being raised to storage bins by means of a belt elevator. The elevator is 64 feet between centers, and has an 8-ply belt 34 inches wide, with heavy steel ore buckets 15x30 inches. The storage hoppers of the crushing bin have a capacity of about 150 tons.

Four steel cars of the side-dump type, each having

There are two lines of stamps arranged back to back, twelve batteries of five stamps each in each line. Each battery is driven by separate pulley, and each unit of four batteries is driven by an independent 50 H. P. General Electric motor, having a speed of 692 revolutions per minute, loaded, and 720 revolutions per minute, light. Each battery is fitted complete with steel cams and tappets, and an overhead Challenge feeder, sectional stamp guides, etc. Weight of stamps complete, 1050 pounds; drops per minute, 106.

The mortar blocks are of concrete, 6 feet 6 inches high above the base, 4x5 feet on the top and 8 feet at the bottom, each pair of blocks resting on a base

tables will pass over the twelve belt concentrators, insuring a high saving.

The tailings from the north side of the mill are carried through a tunnel to the south slope of the hill, where practically an unlimited dumping ground is available, while the tailings from the south side of the mill flow out in an open sluice. All of the tailings can be impounded and it will take years to fill the available ground.

The entire framework of the mill, hoist, crusher house, tramways, etc., is of Oregon fir, shipped direct to Milton, the railway terminus, 12 miles from Hodson.

One striking feature of the mill is the concrete re-

Tonopah, Nev., May 18.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

J. N. Tisdale, superintendent of the Snettisham mines at Snettisham, says he has fifty men at work. The snow does not interfere, as the works are near the beach and the snow recedes early.

At the Sheep Creek mine, near Juneau, an air compressor is being put in.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The shaft of the Dragoon C. M. & S. Co., operating in the Dragons, is down 235 feet. At 230 feet carbonate ore of good quality in white lime rock was struck. Indications point to the uncovering of a body of ore.

Pearce, May 16.

Superintendent P. L. Dwight says operations will be resumed on the Bisbee West mine, near Bisbee, which has been closed down for three months. An engine will be put in and thirty men put to work.

Superintendent C. Cunningham has men at work on the Anaconda & Arizona mine near Bisbee.

The Headberg group of thirteen claims has been sold to Michigan men, with E. Ryan of Calumet, Mich., manager. The group of claims is west of the Wolverine and Arizona groups, near Bisbee.

GILA COUNTY.

(Special Correspondence).—The Pacific M. & M. Co., J. B. Copen, manager and treasurer, and J. D. Copen, superintendent, have bought the Clipper group of copper mines, 7 miles west of Globe, and adjoining the Finletter & Harvey group. The price was over \$100,000, 10% cash being paid down. The Pacific Co. is composed of Denver, Colo., and Kansas City, Mo., men. Manager Copen also took a bond on five adjacent claims.

Globo, May 17.

The pumps and machinery at the Malory shaft, on the Globe-Boston group, near Globe, have been overhauled, and they are cutting the station and will start the crosscut at depth of 450 feet in the shaft.

MARICOPA COUNTY.

The owners of the Black Hawk mine, south of the White Tank mountains, near Buckeye, are building a 10-stamp mill at Buckeye, 7 miles distant. Development work in the mine is down 160 feet, and ore is being stopped.

The Relief G. M. Co., G. Hamlin manager, will build a plant capable of reducing fifty tons of ore daily. Their mines are 22 miles northwest of Phoenix.

H. Slusher is reported to have bought the Wiggins interest in the Anglesite mine, near the Ryland mine, near Wick-enburg.

MOHAVE COUNTY.

It is reported Superintendent Nellson and G. W. Jonas of the Standard G. M. Co., who have been prospecting in the Chemehuevi mountains, south of Kingman, have found an 8-foot vein carrying values in gold. It is 20 miles south of Franconia, on the Santa Fe Railroad. The company has been at work on a number of claims in Mohave Wash, at south end of the range.

PIMA COUNTY.

The Tucson S. & R. Co. have bought the Copper King group of mines, 14 miles southwest of Tucson in Tucson mountains, says the Bisbee Review. They will build a smelter. In one of the main tunnels they have a body of ore that runs 20% in copper. W. W. Robinson is manager.

The Catalina C. M. Co., operating the Catalina group of mines in the Catalina mountains, near Tucson, are putting in a pump, hoist and drills, and intend to erect a smelter. They report having blocked out a body of sulphide ore averaging 7% copper, \$2 in gold and \$2 in silver. There are fifteen claims in the group and F. M. Hartman is manager.

The Old Pueblo C. Co. has organized at Tucson to develop a group of claims owned by H. E. Crepin, A. Rossi et al., 4 miles west of Tucson, in the Tucson mountains. W. P. Haynes is interested. The ore carries values in copper, gold and silver. A 4-foot vein of shipping ore has been opened up at depth of 85 feet, says the Tucson Post.

The Tucson smelting works are reported to have bought 160 acres of land for the location of their works, 3 miles south of Tucson, on the west side of Santa Cruz river.

PINAL COUNTY.

(Special Correspondence).—The Troy-Manhattan M. Co., near Troy, have fifty

men at work. The J. F. McSherry group of twelve claims have been sold to an Omaha company. This group is about 1 mile west of Kelvin and north of the Gila river, the ore carrying values in gold and silver with a percentage of copper. There is considerable activity in mining around Kelvin at present. The Phoenix & Eastern Railroad will be completed to Kelvin by next fall, and it is reported the Ray copper mines will resume when the railroad is finished as far as Kelvin or Riverside.

Kelvin, May 15.

YAVAPAI COUNTY.

The Niagara Copper Co. incorporated last week at Prescott—H. Voge, J. P. Bauder and N. Levy. The Niagara group of nine claims is near the Hillside mine, near Hillside. The values are copper, gold and silver. Some native copper is obtained.

An eighteen months' bond has been given to B. R. Miller et al. on the D. E. Dumas group of copper and gold claims, 12 miles northeast of Jerome, on Sycamore creek, says the Courier.

The Josephine M. Co., which is developing the Black Lode mine, in Hassayampa district, near Maxton, are putting in machinery for deep workings, including hoist, engine and boiler. Drifting has started from the bottom of the 100-foot shaft. The vein is 15 feet wide, the ore carrying values in copper and gold.

YUMA COUNTY.

Superintendent J. A. Rivers of the Success C. M. Co., at Quartzsite, says they will build a smelter. The Success Co. is composed of Los Angeles, Cal., men.

CALIFORNIA.

AMADOR COUNTY.

Superintendent W. R. Thomas of the Central Eureka mine, near Sutter Creek, in his annual report for the fiscal year ending April 1, 1903, shows 43,545 tons of ore were milled, against 21,785 tons for 1901-02. The shaft is 2160 feet on the incline, with a wide vein at the bottom. Most of the ore worked during the year came from the 1900-foot and 2000-foot levels. The cost of mining and milling for 1901-02 was \$4.47 per ton, while for 1902-03 it came under \$3 per ton. Following is an itemized statement:

Total ore milled during the year,	tons.....	43,545
43,545 tons of ore yielded in free	gold.....	\$213,421 17
1283.8 tons of sulphurets yielded		48,481 83
Total		\$261,903 00

Average value in free gold per ton.	\$4 901
Average value in sulphurets per ton	1 113
Average assay of tailings per ton...	0 485

Actual value of ore.....	\$6 499	
Average net value in free gold per	ton.....	\$4 866
Average net value in sulphurets per	ton.....	0 865

Total net value, after deducting	cost of refining bullion and reduc-	tion of concentrates.....	\$5 741
----------------------------------	-------------------------------------	---------------------------	---------

Quicksilver fed inside batteries, ozs.	18,492	
Average yield per ounce of quick-	silver fed in free gold.....	\$11 49
Amalgam cleaned up, ozs.....	33,612	
Average yield per ounce of amal-	gam.....	\$6 314

Cost of mining, per ton.....	\$1 795
Cost of development, per ton.....	0 519
Cost of milling, per ton.....	0 490

Total cost per ton.....	\$2 804
Bullion produced to date.....	\$661,527 44

During the year the mill was idle thirty days, owing to electric power being shut off; twenty additional stamps were completed and an air compressor and four more machine drills put in.

CALAVERAS COUNTY.

The Lightner mine at Angels is closed, to retimber the shaft from the 300-foot level to the surface.

A mill is being put up on the Shepard gravel mine at Banner mills, near Sheep Ranch.

It is reported the Pioneer Chief and Illinois mines, southwest of San Andreas, will begin operations June 1st.

The Oriole mine, near Angels, reports a satisfactory clean-up last week. During the past thirty days 1897 tons of rock have been put through the 10-stamp mill. The shaft is down 647 feet and in excellent milling rock; at the 500-foot level the south drift is run 500 feet, the north drift being 400 feet, with crosscutting east on the south drift. On the 600 level the south drift is 400 feet in milling rock, the sulphurets going \$50 per ton. At the 200 level work is also being done.

EL DORADO COUNTY.

H. Anderson of San Francisco last week bought the Sunshine mine for \$5000; also the Lee mine in Greenwood district, near Greenwood, for \$10,000. Both are quartz mines. Anderson owns four mines in that district, including the California Jack.

KERN COUNTY.

The United States Supreme Court has rendered final judgment in the "scripper" case of Clarke et al. vs. the Kern Oil Co., and other cases involving the same questions and rights. The Kern Oil Co. and other mineral proprietors are confirmed by the judgment in their ownership of oil lands against the claims of Clarke et al., who, by filing entry, sought to take up the lands as agricultural lands, in lieu of forest lands which they gave up. The decisions of the lower courts and of the Secretary of the Interior and Commissioner of the General Land Office are confirmed. One important point finally settled by the case is that petroleum lands are mineral lands under the mining laws of Congress.

The Webber Oil Co. has incorporated at Bakersfield with A. A. Webber, H. F. Peart, W. V. Doughty, E. A. Clausen and J. A. Marsh, directors.

NEVADA COUNTY.

The Hibbe G. & C. M. Co. has incorporated at Salt Lake City, Utah, to operate a group on Bear river, near Sheridan, Placer county. H. Hibbe is manager. W. H. Karchner, J. Petres, J. French, G. Greltman, H. J. Kempton, M. E. Leahy, V. M. Curtis, W. L. Grubbs, W. P. Adams, E. T. Maxwell, T. J. Cunningham, H. Booth, Salt Lake City, Utah, are incorporators.

D. Johnson and M. R. Vernon of San Francisco have bonded the Rocky Glen mine, 1 mile from Graniteville, for Leavenworth, Kan., men. Development work will begin next month with Vernon as superintendent. A compressor and machine drills are to be put in and as soon as the tunnel has been run a mill will be built.

A 500-foot tunnel will be started next week at the Alta-California gravel claim, near Nevada City, which is under bond to Root & Heisner.

It is locally reported the California mine on Deadman's Flat is bonded by W. C. Adams for an Eastern company for six months for \$30,000. The mine adjoins the Seven-Thirty and is near the Standard, which is being developed. It is 3 miles southwest of Grass Valley. The shaft is down 280 feet, and is equipped with a hoisting and pumping plant, in addition to a 5-stamp mill.

Superintendent C. E. Wodell at Shady Creek, between Grass Valley and North San Juan, says he has men at work to develop a group of claims bonded by H. Drescher and C. L. Canfield of Sacramento. The tailings that have accumulated in the creek will be worked over until the bed of the old stream is reached. A ditch and pipe line will be built, and means for elevating the tailings out of the creek provided.

The Mountain Maid mine at You Bet is temporarily shut down.

Superintendent Kartschoke of the St. Gothard mine at Columbia Hill, near Grass Valley, reports development work progressing. Additional machinery is being placed, including an engine and pump which will be used to unwater the 1000-foot level, at which depth a body of ore was opened last year.

H. Kaler, superintendent of the Gray Eagle mine, at Washington, says the tunnel has been driven in 388 feet. The 10-stamp mill will be in operation next week. A flume is being built to carry the water for power. While excavating for the mill they uncovered a ledge of rock that was not before known to exist, showing an average value of \$30 per ton.

PLACER COUNTY.

Superintendent J. B. Hanna of the Barton mine near Auburn says he has twenty-two men at work and development will be increased.

Men are at work at the Crater mine, near Auburn, cleaning out the shaft to reach a 3-foot ledge in the lower tunnel. F. D. Hussey of Louisville, Ky., who has an eighteen months' bond on the Crater, is preparing to prospect the adjoining Kittler and Walsh claims.

SHASTA COUNTY.

Near Shasta free gold ore is reported found which is thought to be the source of the placer gold of Middle creek, Salt creek and Rock creek.

The Shasta Mountain C. Co. has sold to A. Onn its Spread Eagle group of quartz mines in Flat Creek mining district, near Redding.

Final payment is reported made by the Mount Shasta G. M. Corporation on the Pioneer G. & S. M. Co. (McClure) group of mines, adjoining the DeLamar Bully Hill

mines, near Winthrop; H. C. McClure of Los Angeles is superintendent.

The Bennington group of nine claims (Little Nellie group), near Iron mountain, near Keswick, have been bonded to E. H. Scott of Pittsburg, Pa., for \$18,000.

At the Bully Hill mines, at De Lamar (Winthrop), the converters in the smelter are running two shifts, and bullion shipments have begun. On the 12th inst., a day's run of one furnace on the black ore recently opened on the 570-foot level yielded forty-two bars of copper bullion, carrying values in gold and silver, says the Redding Searohlight. By the end of this week it is expected to have both mine and smelter in full operation, says Superintendent Keating.

The Evening Star mine in Old Diggings district, near Redding, is in operation.

SISKIYOU COUNTY.

(Special Correspondence).—The Yreka M. & M. Co. have their 20-stamp mill running steadily on ore from the Mountain Laurel and Aida claims. The ore from the Aida is carried to the mill by an aerial tram, and averages \$6 per ton. The ore in Mountain Laurel claim is higher grade. Improvements are proposed this summer, including the addition of power drills, cyanide plant and enlargement of the mill. A. J. Ball, part owner of the Ida May mine, near the Mountain Laurel, will begin grading for his mill next week. R. L. Fagundes' mill at Rollin is running steadily, crushing custom ore. Many prospectors are coming into the Salmon River country for spring work. All the mines and mills in this section are taking advantage of the supply of water and are running full blast. The water season will last two or three months yet, according to the altitude and location of the mines. There is still a scarcity of good miners in this section.

Rollin, May 18.

B. A. Caldwell, superintendent of the Siskiyou County D. Co. coal mine, at the Herr ranch, between Yreka and Ager, is manager of a company organized at Denver, Colo., last week with C. Tucker, J. S. Perky and L. L. Rees to develop coal and oil property. He has bonded a section and a half of land in Sbasta valley, near Snowden, for \$38,400, in which coal is thought to exist; also the J. E. Harmon section for \$51,200, and the J. E. Cooley section, says the Journal. This location is 7 miles north of Yreka, covering 3800 acres.

The J. S. Lowden mining claims have been bonded to C. Tucker, J. S. Perky, L. L. Rees and B. A. Caldwell for \$30,000, including all water rights and privileges. The claims comprise the King hydraulic mine, the Fine Gold, the Santa Cruz and Monterey mines at Hamburg Bar, Klamath river, near Yreka. The company has also located 10 miles of ground around and above Hamburg, and will build a 14-mile ditch from Scott river, to furnish water for hydraulicking.

O. H. Lawson & Co. will open up their group of mines on Humbug creek, near Hawkinsville, and begin development work by June 1.

TRINITY COUNTY.

Operations were resumed last week on the Yellowstone mine on the East Fork, near Trinity Center, under bond to W. Gill.

TULARE COUNTY.

In connection with other "scripper" cases the U. S. Supreme Court has also decided the cases of the Cosmos Exploration Co. vs. the Gray Eagle Oil Co. and the Pacific Land Co. vs. the Elwood Oil Co., both suits involving title to oil lands near Visalia, affirming the decision of the Circuit Court of Appeals. These cases involved the general question as to the validity of locations made on mineral lands in lieu of non-mineral lands surrendered within the limits of forest reservations. The Pacific Co. and the Cosmos Co. claimed under the locations of this character, and sought to oust oil companies claiming the lands under the placer mining laws.

TUOLUMNE COUNTY.

T. J. Curley has bought the Niagara and Silent Friend claims, south of the Tuolumne river, near Groveland.—The Harvard G. M. Co., near Jamestown, has bought the Sobrante quartz lode claim.

COLORADO.

BOULDER COUNTY.

The Rosalind tunnel on Hematite mountain, near Eldora, has resumed work, says Manager Hughes.

Manager Mitchell of the Sylvanite M. & M. Co. says they are driving a tunnel on the Free Milling group on El Dorado mountain, near Eldora.

The Golden Age group, near Wallstreet, has been sold to H. E. Simmons & Co. of New York and operations will resume next month. A cyanide mill of twenty

tons daily capacity will be built, with an electric power plant on the St. Vrain that will develop 500 H. P. Assays show \$10 in gold. The group was sold for \$250,000 and C. H. Tallmadge will be manager, with M. J. Swisher superintendent.

CHAFFEE COUNTY.

Two more companies are reported organized by Michigan and Illinois men to operate near Winfield. The Fortune mine will be started up next month by S. Hopkins and the Hale estate. Their vein carries galena, with silver values. On No. 2 level there are 2 feet of grey copper ore showing, average smelter returns from which gave \$42 per ton. The Middle Mountain Co. own the northeast extension of the vein for 1800 feet. Superintendent R. Taggart of the Tasmania C. M. & M. Co. says their crosscut tunnel on the Last Dollar mine is going ahead and 30 feet will cut the ore shoot. The Fairplay M. & T. Co. started up work this week. The Belmont and Edna May also have resumed. A. E. Stahler is general manager of the Belmont, Middle Mountain, Edna May, Banker and Fairplay.

CLEAR CREEK COUNTY.

(Special Correspondence)—Since the organization of the Trans-Continental Transportation & Mining Co. last week, with W. A. Cooper as president, R. C. Viñler manager, and J. F. Brandes of Denver consulting engineer, interest in Clear Creek county, especially around Georgetown, is increasing. The object of this company is to build a tunnel through Argentine Pass to permit of the railroad establishing a line through same, thereby connecting with the Colorado & Southern at Georgetown on the east side and Keystone on the west side of the divide, and at the same time shortening the route from Denver to Leadville several hours. In driving this tunnel they will cut the Argentine mineral district. German and English capital is interested. Denver, May 15.

At the Allunde group, near Georgetown, sinking will resume from the 1000-foot level, at the edge of the Haggart ground. The bottom of the level shows the ore body to continue downward. The company is still driving the 600, 750 and 1000-foot levels ahead. Haggart Brothers made a shipment of ore last week from their lease on the 1000-foot level, being thirty-seven tons of silver ore which netted \$6227.27. There have been a number of applications for leases on the adjoining ground, 50% royalty being offered, but the company have decided to work the ground themselves.

J. H. Towne, of Pendleton, Ind., vice-president of the Indiana G. & S. M. Co., has started work on the company's mines on McClellan mountain, near Georgetown.

Another shipment of lead concentrates was made from the Mendota mill, near Silver Plume, last week. The product is taken from the old stopes and dirt that would otherwise go into the dump and be a loss.

A mill for handling their concentrating ores is proposed by the Waldorf Co., near Silver Plume, says the Silver Standard.

Superintendent Towne has men at work on the mines of the Indiana G. & S. M. & M. Co., and operations on the tunnel have resumed.

CUSTER COUNTY.

J. P. H. Callahan and R. E. Myers of Westcliffe are operating a bond and lease on the King of the Carbonates group, near Westcliffe, the lease being for two years and the bond for \$50,000. Most of the development work is on the King claim.

DOLORES COUNTY.

Miller, Lee & Reld, who have a lease on the Vestal dump, one of the United Rico M. Co.'s group, near Rico, are getting their mill ready for operating during the summer. They intend to add another table and otherwise increase the capacity.

FREMONT COUNTY.

The Fidelity Oil Co., operating near Florence, report putting another string of tools in operation.

GILPIN COUNTY.

Additional machinery is being put in at the Benton mine on War Eagle hill, near Rollinsville, operated by the Northwestern Colorado Exploration Co., the hoist having a capacity of raising one ton from a depth of 500 feet.

Work on the 45-stamp slow-drip mill for the Gregory-Buell Con. G. M. & M. Co., near Central City, is progressing. The mill building is a part of the top buildings of the main shaft of the Buell, and the ores when hoisted will be delivered direct to the stamps with but little extra handling. Air drills are working in the 700-foot level running off from the Buell shaft.

The holdings of the Boston & Denver

Con. M. & M. Co., near Central City, were sold at sheriff's sale last week. The holdings, consisting of fifty lode claims, mill sites, the 80-stamp mill, land and real estate, machinery and other improvements, were offered in two parcels, being bid in for a total of \$271,000, by E. W. Hurlbut of Denver, representing the Western creditors, and D. Porter and T. King of Massachusetts, representing the Eastern creditors. E. W. Hurlbut says as soon as the details are completed the properties are to be worked extensively. This will include sinking the Cook shaft an additional depth of 300 feet, which would put it down to the deepest workings of the Flak or Bobtail, a total depth of 1200 feet, and the Cook shaft would be used as the main working shaft of the group.

The Delmonico G. M. Co., operating the Delmonico group on Quartz hill, near Central City, are setting up machinery for the amalgamation and concentration plant and expect to have it in operation by June 1st.

JEFFERSON COUNTY.

Manager Carpenter, of the Carpenter smelter at Golden, says operations will resume June 1.

LAKE COUNTY.

A strike is reported in the Tiger mine, near the head of Iowa gulch, 2 miles from Mosquito range, and 1 mile east of the Reno mine, near Leadville. Ames, McCullom & Son and J. Carter, owning the Tiger, are working through a tunnel 150 feet long, and at depth of 80 feet below the surface, have cut a vein carrying \$60 per ton in gold, twenty ounces silver and a percentage of lead.

The shaft of the Louisville mine on Iron hill, near Leadville, is to be sunk several hundred feet deeper, work beginning next week. At present work is being carried on between the 600 and 700-foot levels in a body of zinc ore. The copper sulphide shoot they expect to strike by sinking has been opened up in the Minnie Lee mine, adjoining the Louisville, by the Yak tunnel.

It is reported the Greenback mines, on Carbonate hill at Leadville, will be consolidated with the Rialto group, and operations resumed.

Manager T. S. Schlessinger of the Bon Air mine, near Leadville, reports opening up a body of lead carbonate ore on the lower 540-foot level. Two carloads have been shipped, showing 200 ounces silver and 15% lead.

MINERAL COUNTY.

Superintendent W. G. Boyle of the Golden Crown Co. says operations have resumed on their group north of the United Mines Co., near Creede, and a new shaft will be sunk.

PARK COUNTY.

The placer season opened last week at Alma and Fairplay. The deal for the Alma placers by the Snowstorm Hydraulic Co. has been closed and J. Fortune is superintendent at Alma and D. E. Rowe at the Snowstorm. Improvements in the way of ditches, reservoirs, etc., are proposed to prepare for a heavy season's gold washing next year, in addition to using all of the water supply available for taking out gold this season.

SAN JUAN COUNTY.

Manager Condit at Silverton says he expects to build this season an electric power plant at Eureka, a concentrating mill at the mouth of the Picaque, and complete the two tunnels now under way—one to cut the Toltec vein and the other at the head of the south fork of Eureka gulch to cut the Grand Mogul vein. Also he says the Astor M. Co. has been organized to take over the Sioux M. Co.'s property and the Astor group of five mines. He has awarded contracts for extending the Toltec tunnel 600 feet and the Mogul tunnel 200 feet, and expects to be stripping ore by August 1.

It is reported that work has resumed on the Marcella tunnel, with J. Woods superintendent. This mine is near the railroad crossing of the Animas river, 1 mile south of Silverton, and the tunnel is 600 feet in Kendall mountain.

SUMMIT COUNTY.

The Mountain Pride M. Co., near Breckenridge, will put on more men and increase development. The mill will be started up next week, says Manager Schwartz.

TELLER COUNTY.

The Mary McKinney G. M. Co. of Cripple Creek will put in a washing machine which will have a capacity of 300 tons of rock per day, and instead of the company shipping three grades of ore they will make one grade.

The cyanide plant of the Globe M. & R. Co. began operations last week on ores from the Ironclad mine on Ironclad hill.

There are four steel tanks, each holding 110 tons of ore. It is figured a tank a day will be used, as the rock from the Ironclad is porous and needs but little leaching. The ore averages \$6 per ton.

The Van Fleet sampler, near Cripple Creek, which has been transformed into a cyanide mill, was turned over by the contractors last week to the Globe R. & M. Co. The plant has a capacity of 100 tons a day and it is the intention of Manager Ross to begin on 50 tons a day from the company's mines and the rest will be custom ore. In addition to other leases the Globe Co. has a long time lease on the Ironclad mine on Ironclad hill. The company is taking out ore, of which there is a large tonnage blocked out in the stopes and drifts. Shipments to the mill have begun.

J. M. Downing, of Denver, president of the Old Gold M. Co., Cripple Creek, says that last week lessees M. C. Greve and C. E. Brady, working in the lower levels, opened up a body of ore while sinking the shaft at the 265-foot point, from which samples gave returns of 3 ounces gold per ton. There are several streaks in the vein, one of which is 8 inches wide, assaying 5 ounces.

The Cripple Creek Cyanide Co. has incorporated; F. A. and F. Wright, C. H. Clark, N. C. Tallafiero and W. G. Briery, with principal office at Gillett. The object of the company is to acquire, lease, hold and operate lodes of gold, silver, copper, etc., also to build and operate mills.

The Aztec G. M. Co., owning a group on Mineral hill, near Cripple Creek, will spend \$20,000 this summer in the development, says Superintendent F. Conner. The Aztec Co. owns the Illk, King Solomon and May Queen, on the northeast slope of Mineral hill. One shift is sinking on the Illk claim and it is the intention of the company to go to depth of 700 feet.

Plans are being drawn for a \$25,000 shaft house and ore bins to be erected on the Blue Flag claims on Raven hill, Cripple Creek, says the Gazette. The property is owned by Denver parties.

An ore shoot is reported opened in the bottom level of the Anaconda mine, Cripple Creek, by H. P. Dahl, operating that portion of the company's ground under lease. The strike was made above the fourth level of the winze. The rock carries sylvanite. The Anaconda vein was barren of shipping values in the second and third levels of the winze. In the third level sulphide began to appear. Dahl's lease permits of his sinking the winze an additional 100 feet, but until the drainage tunnel cuts the water course he can not do anything; as soon as the water is drained out he will resume sinking. There is a total of thirty sets of lessees operating on the company's ground, of which number twelve are shipping ore.

IDAHO.

BANNOCK COUNTY.

The Lost Horse group, near Pocatello, owned by the Intermountain G. & C. Co., is to be equipped with a steam hoist and pump. The mine is shut down temporarily on account of water becoming troublesome. As soon as the machinery is put in the company will begin taking out ore, which will be shipped to the smelter at Mackay.

IDAHO COUNTY.

J. E. Jewell, manager of the Gold Reef Co., Thunder Mountain district, says the Dewey mine, near Roosevelt, has ten stamps dropping.

OWYHEE COUNTY.

Manager W. C. Orem and Superintendent F. C. Clark of Salt Lake, Utah, have started work on the Palmer-Holland group of mines on Florida mountain, near Silver City, owned by the Trade Dollar Extension M. Co. of Salt Lake. A tunnel will be run to cut the Holland mine 100 feet deeper than the point where ore was taken out by leasers last fall. It is then proposed to open the group by a tunnel from a point near Jordan creek, below Black Rock gulch.

SHOSHONE COUNTY.

The decision of the Federal Court against plaintiff in the case of action by P. Clark et al. vs. Buffalo Hump M. Co. and the Empire State-Idaho M. & D. Co. to procure a cancellation of the deed conveying a four-fifths interest in the Ella and Missing Link lode mining claims, near Burke, and to compel a reconveyance thereof, has been affirmed by the Circuit Court of Appeals.

Manager J. E. Steen of the Granite & Ollie Con. G. M. Co. says a cyanide plant will be built, work beginning on it next month. The shaft has been unwatered and ore is being taken out. The group of mines owned by the company are on Granite creek, 5 miles east of Murray. They have a 10-stamp mill operated by water power.

MONTANA.

CASCADE COUNTY.

A strike is reported on the farm of J. Gibson, 5 miles south of Belt, and a Helena company has been given options on the ground. Assays show an average of \$6 a ton in ore, which can be treated by cyanide.

CHOTEAU COUNTY.

The Josephine C. M. & S. Co. has been incorporated under Arizona laws by P. Stark, J. Brown and H. A. Powell of Altyn, Mont. The properties of the company are on Swift Current river, on the Blackfoot ceded strip, near Choteau.

FERGUS COUNTY.

Superintendent R. W. Jones says operations will resume at the Mammoth mines and mill near Lewiston.

F. A. Earls et al. of Salt Lake City, Utah, have bonded the Ansonia and Stand Pat claims, north of the Barnes-King group, in North Moccasin district, near Kendall.

MADISON COUNTY.

The Treasure State M. Co. has been organized to develop the Eleanor and an adjoining claim, near Rochester, also a group of claims near York (Lewels and Clarke county). It is said the company intends to build a mill and cyanide plant at York. Their ore carries values in gold and silver.

PARK COUNTY.

It is stated the Montana Coal & Coke Co. of Horr and Aldridge is making arrangements to open up a new vein of coal, and that the coke output will be increased in consequence, the demand for coke being in excess of the supply.

NEVADA.

CHURCHILL COUNTY.

W. McCann et al. of Wadsworth, Washoe county, have bonded the Sifford claim in I X L district, 90 miles northeast of Wadsworth.

HUMBOLDT COUNTY.

The Nevada Sulphur Co. is shipping regularly twenty-five carloads a week of crude product from Humboldt House. The Nelson copper mine at Jackson creek has been bonded to Eastern parties for \$40,000, says the Lovelock Tribune.

LINCOLN COUNTY.

At the Quartette mine, at Searchlight, development progresses. Next week sinking will resume from the 600-foot level. This level is reported showing a 20 foot vein averaging \$20 per ton. In the mill thirty stamps are dropping, crushing ninety tons of ore daily. F. Siegel has a contract from the Quartette Co. on the Sazerac group of mines.

NYE COUNTY.

The Reno Ray M. Co. of Tonopah has been incorporated at Reno, under Arizona laws; F. D. King, G. F. Halla, J. J. Rafferty, F. G. Kaufman and F. L. White, to operate a group in the Ray district, near Tonopah, and near the Ray & O'Brien mine. Sinking will begin by June 1st.

The Lone Mountain M. & D. Co. has been incorporated under the Arizona laws to operate the Cornella, Rarus, Crown Point, Jack and Iron Quartz claims, adjoining the Eutopia group, owned by Cutting & Griffin, in Lone Mountain district, near Tonopah. J. W. Douglass, W. B. Pittman, V. Perrino, J. Coleman and C. D. Van Duzer are directors. Development work will begin next week.

J. C. Gladden, F. H. Lathrap et al. of Salt Lake City, Utah, have incorporated the Tonopah-Alpine M. Co. to operate a group of seven claims and four fractions adjoining the Nevada-Alpine group at Tonopah.

WASHOE COUNTY.

A one third interest in the Forlorn Hope at Olinghouse canyon, near Wadsworth, has been sold to W. T. Golding for \$5500.

At Olinghouse Camp, near Wadsworth, the Springfield-Nevada M. Co. of Springfield, Mass., has taken over the entire interests of H. T. Benson & Co., merging the Slip, Renegade, Smuggler 1 and 2, and Slip mill on the Golden Fleece placer; latter included the W. M. & M. Co. mill and placer ground; also Cabin No. 2, Midway; Canada, V, and Clipper placer claim, \$20,000 being paid for one-half interest in last named claims. Both mills are to be kept on continuous run of ore from Cabin No. 2 and Slip and Renegade mines. I. Miller of Westfall, Mass., is president and manager, and H. T. Benson is superintendent.

WHITE PINE COUNTY.

The Ne Plus Ultra mine at Hamilton is shipping ore.

McCornick & Co. of Salt Lake are reported to have bought the Grand Deposit, Defiance and Kansas groups on Muncie

creek for New York men for \$100,000. In the three groups are thirty-four locations, 70 miles west of Oasis, and on which 2000 feet of work has been done. Ore showing an average of 6% copper, \$2 gold and eight ounces silver has been opened up.

NEW MEXICO.

COLFAX COUNTY.

The Confidence mine at Elizabethtown has closed down temporarily pending the arrival of additional machinery which will be used for further development work. The main shaft is down 400 feet, at which point the vein has been cut. The company will move its mill to the mine.

GRANT COUNTY.

The E. G. Maroney interest in the Tarantula mine, in the Burros mountains, near Lordsburg, has been sold to C. Morrill, who, with W. B. Wayland, the other owner, has begun sinking in the shaft.

GUADALUPE COUNTY.

Development work in the oil field around Santa Rosa has ceased, except by the O. K. Crude Oil Co. This company is down 850 feet and is reported making slow progress in drilling, as it experiences considerable trouble in getting the machinery out of the well and replacing worn out or lost parts. Work has been suspended on the Newman and the machinery will be used in drilling another well by another company, 1 mile distant from the Newman well. Other companies are holding off to let the O. K. Co. explore the field, says the New Mexican.

SIERRA COUNTY.

C. M. Root & Co. are working the Happy Jack mine and the company has leased the Philadelphia M. & M. Co.'s mill at Andrews for treating the ore. E. J. Fender is mill superintendent.

TAOS COUNTY.

The Glen-Woody M. & M. Co., near Taos, W. M. Woody, manager, has forty men at work and are building a mill and cyanide plant.

OREGON.

BAKER COUNTY.

Superintendent J. J. Hennessy says operations will resume on the Goldhug-Grizzly group, near Sumpter. There is a shaft down 100 feet and midway between two parallel veins. It will be sunk 200 feet deeper, at which point it is estimated one of the ledges will be cut. A crosscut will be driven to the other. The Goldhug-Grizzly consists of ten claims, near the hex, owned by Minneapolis, Minn., men. The mine is equipped with a steam sinking plant, capable of going down 1000 feet.

Superintendent F. T. Kelly of the I X L and Hidden Treasure mines in the Greenhorn mountains, near Sumpter, says operations have resumed. A 5-stamp mill, to be run by steam, will be built, construction beginning next week. It is intended also to put in a sawmill this summer. On the I X L there is a 200-foot shaft and 400 feet of drifts; on the Hidden Treasure the shaft is down 110 feet, with 200 feet of drifts. Average assays of the ore show \$10. When operations were suspended in February, a cross vein connecting the parallel veins in the two mines was being opened up.

Superintendent Neel of the Oregon S. & R. Co., at Sumpter, says the blower, the Corliss engine, all the shafting, the hoilers and piping are all in place and the furnace is nearly finished. It is expected to have the plant in operation by May 20. In the briquetting department connections have been made for the conveyors to and from the compressor. The roads about the plant are being macadamized to facilitate hauling.

The Troy, N. Y., owners of the Carpenter Hill group, Pocahontas district, near Baker, are putting up a 5-stamp mill. This company has been doing development work on the Carpenter Hill and three veins have been opened up. One vein shows a 2-foot shoot. The mill will be amalgamating and concentrating, and the frame of the building will be made large enough for the addition of other stamps later on.

Work at the Blue Bird mine near Sumpter is being concentrated largely on the drift on No. 3 vein, says Superintendent Thorpe. He is driving another crosscut from this drift to determine the width of the ore body again. These crosscuts are made at intervals of 75 feet, the last one showing the quartz 13 feet wide. He has concluded to delay the erection of the compressor plant until the mill that is to be a portion of the developing plant has been built. It was thought better to have both go up at the same time, as, if the drills were put into the drifts where the ore body is found, a large amount would be removed, even from the headings,

which would have to go over the dump, there being no room for storage bins.

W. E. Saunders, J. Rosenthal, J. H. MacCallum and R. L. Neill have incorporated for the development and operation of the Pulaski group of mines, near Sumpter.

Manager W. Cable has men at work on the Adalene group of the Oregon G. M. Co. on Rock creek, near Sumpter. A tunnel is being driven into Elkhorn mountain.

Manager Butze began work last week at the Little Cracker mine, near Sumpter, and has started a crosscut tunnel which is expected to cut the vein at a depth of 125 feet.

Development work began last week on the Gold Reserve, between the Bonanza mine and the Gladstone, near Sumpter, under Manager W. H. Meade. The Gold Reserve Co. is made up of Spokane, Wash., men, F. W. Hilcher president.

Manager J. B. Higgins of the Constellation mine, near Sumpter, says work will begin June 1.

The foot wall in the Midway crosscut, near Sumpter, was reached last week, says Manager Hendryx, showing a vein 80 feet wide. The crosscut was carried ahead till the country rock had been entered 20 feet in firm, non-mineralized slate. The shaft will be sunk on the foot wall side, as the vein dips at a high angle and the country rock there insures a safe, economic working shaft.

GRANT COUNTY.

The Standard Con. G. M. Co., near Quartzburg, report development work progressing. The drift on the Standard vein is opening up ore showing values in gold, cobalt and copper. Work is also being done on the Cleveland-Wille Boy crosscut, and it is expected the vein will be reached on this level next week, giving a depth of 350 feet. It is intended to build in the early fall a reduction plant.

The Hoosier Boy Co., operating in Prairie district, has been reorganized, says L. G. Wheeler of Baker City, the name of the new company that will handle the Prairie Diggings mine and mill being the Juniper G. M. Co. The Hoosier Boy Co. will continue to operate its northern Idaho mining properties, while the Juniper will work the Prairie Diggings group. J. W. Messner is manager.

Manager J. P. McGuigan of the Alamo mine at Alamo says he is putting in the foundations for their water power plant and stamp mill.

JACKSON COUNTY.

A 5-stamp mill and other machinery have been installed at the Bowden quartz mine, near Gold Hill, by the Bowden G. M. Co. of Los Angeles, Cal. They have run a number of tunnels and shafts and exposed a workable ore body.

JOSEPHINE COUNTY.

The smelter at the Sowell copper mine, near Waldo, will be blown in next week. These mines are owned by the Mountain View Copper Co. The ledges have been opened to depth and carry values in gold with the copper. The question of transportation is expected to be settled this summer by building in of the Oregon & Pacific Railroad, which line will pass through the center of Waldo district. The Waldo S. & M. Co. are preparing to open up their mines next month.

MALHEUR COUNTY.

Manager J. F. Melke of the Black Eagle mine, Malheur, says he expects to start up their 20-stamp mill again next week.

SOUTH DAKOTA.

CUSTER COUNTY.

F. C. Crocker, at the J. R. mine, near Custer, is putting in an air compressor and air drills. The shaft is down 200 feet, at which point the ledge was cut and later explored by a drift of 500 feet, showing values in gold.

The White Cloud M. Co. has men at work on its claims near Custer and a shaft is being sunk. The vein is free-milling quartz, assaying \$14 in gold. There are nine claims in the group on Laughing Water creek, with a water right carrying sufficient water for milling purposes and millsite. The group adjoins the Gold Flash.

TENNESSEE.

J. P. Channing of New York, manager of the Tennessee Copper Co., operating at Copper Hill, says in twenty-eight days two furnaces on the properties of the Tennessee C. Co. reduced 30,095 tons of ore, an average of 537 tons daily to the furnace. This did not, of course, include the coke employed in the charge. The total cost of reducing the ore last year was \$1.05 per ton, while returns thus far the present year shows further reductions in the cost of treatment. The tonnage per employee smelted was twenty tons a day.

UTAH.

BEAVER COUNTY.

The Royal G. & C. Co. was incorporated at Denver, Colo., last week by A. B. Lewis, C. C. Parsons, H. W. Robinson, W. L. Jameson, C. J. Caughey, F. Knox, J. Henshaw and E. F. Freudenthal. A. B. Lewis of Salt Lake City is president. The main office of the company will be at Salt Lake. The company controls a consolidation of 200 claims, including the Montreal, Atlas, Beacon, Mammoth and Highland Boy groups near Milford, also the Adams & Muldoon groups in Washington county. These groups include gold, silver, lead and copper properties. President Lewis says it is the intention to begin work at once on the Montreal, Rebel, Atlas, Nellie, Monitor and Highland Boy groups, and by fall 200 men will be at work. Next year a 1000-ton smelter will be put up near Milford.

Twenty-five miners went on a strike last week at the Old Hickory mine of the Majestic Co., near Milford, because the management refused to accede to the demand that the machine men and chuckers in the shaft be given \$3.25 per day, and in the tunnel \$3. The machine men had been receiving \$3.25, but the management insisted that the chuckers were merely helpers and should receive \$2.75, the same as the miners. The miners claim the chuckers and machine men change off and that as much skill and experience are required from one as the other. It is said there has been some talk of organizing a union. Although only four men were affected by the disputed point, all the miners quit, were paid off, and the mine closed down. Machinery repairs are being made.

President A. B. Lewis of the Royal G. & C. Co. has added a total of thirty-five claims to the company's holdings, including the Marengo group, in Star district, and the Culcossal and Gogehic groups in Beaver Lake district, near Milford. He says gasoline hoists and complete equipment for the development of the Montreal and Atlas-Monitor groups will be put in.

The Newhouse M. & S. Co. has incorporated at New York. It is understood, to acquire from S. Newhouse his mining interests in Beaver county, including the Cactus copper mines; L. Kramer, T. L. Hermann, J. Josten, W. C. Taylor and A. B. Ditter are directors.

GRAND COUNTY.

Manager Duto of Memphis, Tenn., has started work on the Grand View tunnel, near Basln, in the La Sal mountains. They will run 400 feet to crosscut the Lincoln vein.

IRON COUNTY.

A strike is reported made in the Johnny mine at Stateline. The find was made in the old cage shaft while sinking. It is proposed to add twenty more stamps to the mill, says Manager W. J. Dooly.

JUAB COUNTY.

Superintendent W. D. Sheppard says he is arranging to put up a 20-stamp mill at the Pioneer mine, near Diamond.

Superintendent C. E. Allen last week resumed sinking in the main shaft of the Centennial-Eureka mine at Eureka. Operations ceased last month on account of an inflow of surface water. The shaft is down 20 feet below the 1400-foot level, or 1600 feet from the surface. It is intended to send it down 500 feet farther, at which point a station will be cut and a drift started to tap the ore bodies at that level.

The Lilly M. Co., operating in East Tintic district, near Eureka, will be reopened by June 1 and further development work done. The mine is equipped with hoisting apparatus, ore bins and blacksmith shop and the shaft is down 200 feet. The ore is galena.

The Dagmar-Northwest Co., near Eureka, have set up their compressor and the 15 H. P. engine will be replaced by a heavier one. The shaft, which is down 300 feet, will be sunk to the 500-foot level, when drifting will be started.

At Eureka, the Centennial-Eureka payroll for April amounted to \$15,000, the Eureka Hill \$3000 and Gemini \$6000. Other mines near Eureka paid out \$12,000 more, making a total of \$36,000, with about the same amount around Mammoth, Silver City and Diamond.

PINTO COUNTY.

The L. and N. group of fifteen claims in Ohio creek mining district, near Marysville, under bond and lease to J. F. Mount of Richfield for \$50,000, will be taken up and operations begun next week. The mines of Moon & Mathews on Deer creek are reported sold to Salt Lake parties. G. F. Dalton, manager of the Gold Vein M. Co., says work has resumed.

The Iron mine, east of Marysville, has men at work and will for the present ship acar a day. L. E. King is superintendent.

SALT LAKE COUNTY.

Manager Hatfield reports the drills run-

ning on tunnel and crosscut at the mines of the Albion M. Co., at Alta. The tunnel is in 940 feet, while the crosscut has been driven westward 135 feet.

The driving of the intermediate tunnel on the group of the Kennebec M. Co. at Alta resumed this week, through which the ledges of the Reed & Benson mine are to be reopened at greater depth. In the meantime the crosscut from the lower tunnel, in 4030 feet, is being driven ahead to a connection with the Flagstaff ledge, which is expected to be tapped within the next 100 feet at a point 1700 feet below the outcrop and 700 feet below the old stopes.

In the Dalton & Lark mine, at Bingham, the flood level has lately been receding at the rate of 5 inches a day, and the 850-foot is dry. Development work will begin on the 850 level next week. Owing to the rush of water the tunnel was last week advanced but 38 feet. A few days ago the tunnel went from quartzite through several feet of porphyry and is in quartzite again with an increased flow. Two cars of sulphide ore are shipped from the Brooklyn dally, while one goes from the Sampson, and an occasional carload of lead ore is sent out.

The mines of the Columbia M. Co., at Bingham, will be equipped with a concentrator, says Manager F. B. Cook. For three years, during which the company has been opening up its ore bodies, the management has been putting its low-grade copper-bearing rock through the Rogers mill, and deriving from it a product containing 30% copper with fractional values in gold and silver. The concentrator will treat 250 tons of rock daily. Milling ore has been opened up in the All's Well, What Cheer and other veins.

Superintendent Hall of the Copper Belt, near Bingham, reports they are shipping 250 tons of ore from the Commercial (Bingham Con.) dally, and that the Kempton shipments will soon be 100 tons a day, says the Bingham Bulletin.

The Ben Butler and Chicago & Bingham companies at Bingham have decided to drop the apex controversy and consolidate their interests as the Ben Butler-Liberal M. Co. Manager Jacobs of the Ben Butler will be manager for the consolidation.

The Sampson mines have been sold by the Western Exploration Co. to the Bingham Con. at Bingham.

SUMMIT COUNTY.

The Alaska, near Park City, has been shut down and the pumps pulled.

It is reported the La Reine mine, adjoining the Uncle Sam, near Park City, will resume.

Driving in the tunnel of the Steamboat group of mines, at the head of Snake creek, near Park City, resumed this week, says Manager W. V. Rice. The tunnel, which has been extended for 1600 feet, will connect with the main ledge in the next 300 feet, according to measurements.

The Ontario Con. G. M. Co. will begin sinking a deep shaft on its claims west of the Scottish Chief and Western Monitor at the head of White Pine canyon, near Park City. The group consists of twelve claims and is principally owned by Park City men, with J. E. Lucey as president and manager.

Fire of unknown origin destroyed the Park City zinc plant at Park City on the 14th inst., and also the office building; loss estimated at \$100,000, well covered by insurance. The plant had a daily capacity of 100 tons; A. L. Dickerman is manager of the company.

Superintendent Rood of the Ontario Silver M. Co., in his annual report for the year 1902 shows receipts from all sources was \$356,967.65. "Of the 25,922 net tons mined and sold, 24,678 tons came from the 1500-foot level and above, since no stoping was done below it. On December 31 all ore extraction was suspended. The ore remaining above the 1500-foot level was not yielding a profit sufficient to justify extraction under existing market conditions. Below that level so much of the ore has appeared to be of a concentrating grade that it was not expedient to begin extraction until it can be separated and treated according to its character. Notwithstanding the increase in certain classes of expense, due to deeper mining and to ore reserves diminishing above the 1500-foot level, the gross expenditures for the year were less than for 1901, except in the item of deadwork. The receipts, however, were lessened by difference in grade of ore, smaller tonnage and by fall in price of silver. In 1901 average sale price for silver was 58.17 cents per ounce, in 1902, 52.73 cents per ounce. The comparative loss on the value of silver alone amounts to \$60,000. These results indicate the necessity of new methods and lower treatment cost. The nature of the treatment to be adopted for the low-grade ore will be governed by the results of experiments in progress."

The mill at the Comstock mine in

Thayne's canyon, near Park City, is in operation, says Manager Dusseidorf.

WASHINGTON.

FERRY COUNTY.

Manager W. M. Ridpath of the Lucille Dreyfus mine, near Republic, says it is proposed to drive a tunnel from above the track of the Washington & Great Northern Railway. There is on the dump of the tunnel level upon which the hoisting machinery is in operation 150 tons of ore, the value of which runs \$90 per ton. The ore is of smelting character. The winze is down 135 feet below the tunnel level.—The Mineral Hill mine at Danville is still idle.—In the Faithful-Surprise connection has been made between the Surprise shaft and the tunnel. Some surface work is being done toward starting a new tunnel.

KLICKITAT COUNTY.

Drilling for oil by the Columbia River Dev. Co. was resumed last week at a point a mile west of Castle Rock, Or., on the opposite side of Columbia river, where the drills are down 200 feet. Considerable interest is reported being taken throughout Oregon and Washington over the oil prospects along the Columbia. Secretary F. Graham says the company has secured 20,000 acres by location under placer mining laws and by lease.

OKANOGAN COUNTY.

On Palmer mountain, near Loomis, a strike of free gold ore is reported on the Security mine of the Security G. M. Co., showing 2 feet in width, with values in gold, silver and galena.

Superintendent C. Peterson has men at work driving the tunnel at the Favorite mine, near Loomis.

Superintendent J. M. Hagerty, at the Ruby mine, on the east slope of Mount Chapaca, near Loomis, says three eight-hour shifts are driving in the lower tunnel, making 6 feet per day.

SNOHOMISH COUNTY.

A. S. Chase, of Gold Basin, manager of the Sunrise M. Co., says operations will resume next week. A tram, three-quarters of a mile long, will be built between the mine and the company's road on the south side of the range. This road was built last summer and connects with the "45" road to Wallace, Idaho, on the Great Northern, which will be the shipping point for the Sunrise.

STEVENS COUNTY.

B. F. Parker, manager of the Alice G. M. Co. of Blue Creek, says the stockholders in Portland, Astoria and Spokane have decided to put in a concentrator, which will be of fifty tons daily capacity. It is expected to have it in operation by August 1. The mines are $4\frac{1}{2}$ miles northwest of Chewelah, $1\frac{1}{2}$ miles from Blue Creek siding. Considerable development has been done, but for two years the property has been idle. The ore bodies show a ledge 27 feet wide, assaying \$6 in gold and a percentage of copper. The ore also carries a little silver, but no lead. Some machinery that is on the Stella, owned by the same company, will be transferred to the Alice and men will be put to work in the lower workings and stopping begun.

Superintendent B. J. Gleason of the Old Dominion mine, near Colville, says that F. Peck of Chicago, Ill., and his associates, who own the group, will take an interest with the lessees of the mine and work will be increased. The 100-ton concentrator that has been idle at the mine for the past six years will be overhauled and put in operation. The flume, which furnishes the concentrator with water from a stream 2 miles away, has been repaired, and the air compressor at the lower tunnel is in operation. Since work was suspended several years ago the lower tunnel, which has a length of 3000 feet, has fallen in in places, and it is being cleared and retimbered.

The Silver Butte mine, operated by C. Knutson, expects to ship 600 tons of silver-lead ore during May. This property has been unproductive for some time owing to the shaft being filled with water, but during the winter a tunnel was started to tap the lower workings, which is expected to be finished by August 1.

The Last Chance mine (formerly the Silver Butte), on the east side of Deep creek, 8 miles from Northport, has resumed shipments, says C. C. Knutson, manager. Fifteen tons of ore a day will be shipped, until the 600 tons on the dump are delivered at the smelter. Stopping will also resume. The ore carries 18% lead, fourteen ounces silver and \$3 in gold per ton. Besides this ore there is a body of concentrating ore. A crosscut is being driven that is expected to tap the ledge at 380 feet on the 200-foot level.

WYOMING.

FREMONT COUNTY.

The Fremont County Oil, Gas & Coal Co. began operations last week on their

oil lands in Teton Basin district, near St. Anthony. Equipment capable of going to a depth of 1800 feet has been put up.

UINTA COUNTY.

The Idaho-Wyoming Oil Co. report increasing their holdings to 15,000 acres of land, most of which lies in Fossil Oil district, near Fossil. They are sinking two wells and will do additional development the coming season.

FOREIGN.

AFRICA.

CAPE COLONY.

The Cape Tin Mines, Ltd., report stream tin, as well as tin-bearing lodes, on their lands 16 miles from Cape Town. The Cape Government have no claim upon tin or tin ore, and no Government royalty is, therefore, payable. Manager Mills-Davies reports that the depth of the deposit of stream tin to vary from 1 to 15 feet, with average value of 30% tin. On Annex Langverwacht at least two lodes have been found carrying tin, viz., the Langverwacht and Clinton lodes.

AUSTRALIA.

NEW SOUTH WALES.

Recent experiments in treating cinnabar from the Great Australian Quicksilver Co. mine at Yuigbar, on the Clarence, carried out in a newly designed furnace, having proved satisfactory, the company decided to build a battery of similar furnaces at the mine. These are expected to be in operation by June 1. It is estimated the ore can be mined and reduced for £2 per ton, and the company expects to make a profit out of 2% ore. There are 400 tons of 4% ore in the dump, and bodies of 2% and 3% ores are opened in the mine.

The British Broken Hill Proprietary at Broken Hill report, in Blackwood shaft, 300-foot level, good mill ore is being broken in the south end of main west stopes, in stopes off No. 4 winze, and in stopes under No. 7 shaft, also in the north and south ends and center of the main west stopes, 400-foot level. In Howell shaft, 300-foot level, fair grade ore is being broken from the central stope and from north end of stopes on 400-foot level. On 500-foot level stoping started with two machines.

A discovery of copper has been made 3 miles from Molong.—At Glen Innes mining for molybdenite is receiving attention, and a number of new claims have been taken up.

Alluvial gold is being obtained at Kianga creek, near Moruya. There are forty men on the ground. At the field known as Rat's Head, in the same district, recently a miner found a nugget weighing 2½ ounces.

Pay rock is being raised from Seymour's Doughboy Hill mine, Bywong. A drive is in 80 feet at the 150-foot level.—The revival of mining along the White Reef, West Wyalong, is due to a shoot of ore showing in the Barrier mine, which has been driven 230 feet, giving an average width of 2 feet, and yielding two ounces per ton.

Activity in mining is increasing around Cowra. A number of prospectors are making wages, and claims are being opened up. All the available country has been taken up. The battery at the company's mine is not sufficient to treat all the ore from the field.

The Union Jack Co., Tumberumba, has taken up 100 acres in the bed of Tumberumba creek under the new Gold Dredging Act, and has thirty-four men dry-stripping who have a large tonnage of wash dirt ready waiting for water.

QUEENSLAND.

New Chillagoe R. & M. Co. returns from smelting works for March: Treated—Chillagoe ore, oxidized, 1543 tons; sulphide, 903 tons; Mungana ore, 872 tons; lead furnace matte, 94 tons; total, 3412 tons; producing 291.5 tons of matte, containing 152.6 tons of copper and 7888 ounces of silver.

The March returns for Charters Towers field are: Mills—19 906 tons of ore crushed for 21,500 ounces gold. Cyanide works—18,500 tons residues treated for 10,000 ounces bullion. For the quarter ending March 31st 57,313 tons milled gave 60,500 ounces, compared with 48,700 tons for 49,000 ounces for the same period of 1902.

VICTORIA.

At Creswick, the drives at the Berry Consols Extended have been fitted up ready for the installation of the electric haulage plant, which is expected next month.

In Mount Morgan field, the crushings for March were: Mt. Morgan mine, 19,515 tons yielding 11,259 ounces, of the value of £3 19s 6d per ounce; Mt. Usher mine, 310 tons for 240 ounces, value £3 13s per ounce.

WEST AUSTRALIA.

President C. A. Moreing of the great Fingall Con., Ltd., in his annual report to the directors at London, says during 1903 the main shaft was sunk 589 feet, making 758 feet total depth, and is now 100 feet deeper than the Armstrong shaft. The Armstrong shaft was a small shaft, sunk in the early days of the company, but with the increased size of the mine, and of the equipment, this shaft was not large enough to handle the ore. From the new shaft it will be feasible to work the mine to a depth of 2500 feet. During the year developments in south of No. 4 level and of No. 5 level have shown the main ore chute, instead of being more or less like an inverted fan, is quite regular in size, from the fourth level to the bottom. In the old levels (first, second and third) the ore body was short, and the ore in the south of these levels averages 6 dwts. only, so that this portion at the top of the chute is assumed to be unpayable, yet on development it may prove otherwise. A winze was sunk from No. 8 level down to the future No. 10 level, in which results were uniformly satisfactory. Outside the main pay chute another chute was found, which is of lower grade, averaging 14 dwts. in the level. It is 400 feet long and 7 feet wide. At the bottom of No. 2 water shaft 7 feet of ore was struck, running 18 dwts. a ton. No. 5 level is being driven south. During the year 90,950 tons were extracted, taken mainly from between the sixth and seventh levels. The reef is wide and cost of timbering high, so it was decided the more economical way to work the mine was to stope the ore continuously from the seventh level to the fifth level. This will evade the necessity of timber at the No. 6 level. Then, it is proposed to stope from No. 5 level, which is already timbered as far as payable ore extends. Also, it is proposed to stope the mine from the ninth level to the seventh level, and in future levels will be placed farther apart. The mill has been increased from thirty to sixty stamps, with the entire remodeling of the cyanide plant and corresponding increases in the concentrating works. The treatment has given an average of 92%. Of the tailings from the mill 38% are slimes, of which 45,000 tons have accumulated, which run 4 dwts. per ton in value. A slimes plant is in course of erection. It is proposed to increase the mill to eighty stamps. The working costs have been steadily reduced during the year, showing a reduction of 10s. per ton, reaching 26s., not including development work, but including all other expenditure.

The Mint receipts for the month of March were 115,824 ounces.

Experimental work with a magnetic separator at the Broken Hill Block 10 mine is stated to be showing profitable results.

The gold yield of West Australia for March was 194,723 ounces—an increase of 17,000 ounces over March, 1902.—An alluvial find is reported from Black Range, near Mount Magnet. The first day seventy ounces of gold were obtained, including a sixteen-ounce slug.—The Ivanhoe Gold Corporation report the middle lode cut by the borehole 118 feet west of Patterson's shaft, 865-foot level. For the first foot drilled, borings assay gave 10 dwts. gold per ton.

A discovery of alluvial gold has been made near the Lady Mary mine, 5 miles southeast of Norseman, in the claim of Hamdorf & Steadman, at depth of 80 feet. In a claim south of the original find Shepard & Co. also obtained pay.

At Kalgoorlie, the diamond drill at the Great Boulder, stationed at the 600-foot level in Jansen's shaft, at north end of group, cut the northerly extension of the Ivanhoe east lode at a point 280 feet north of latter's lease boundary, and at depth of 1335 feet from surface. At point cut it averages 25 dwts. over a width of 10 feet. The management of the Ivanhoe has, with the consent of the Boulder Co., decided to put in a series of drillholes westward from the bottom workings of the Great Boulder, to test the main Ivanhoe ore bodies at vertical depth of 1600 feet.

BRITISH COLUMBIA.

(Special Correspondence).—Manager W. Gray, of the Velvet-Rossland mine, Ltd., says from March 25th to April 29th they were unable to ship, owing to the state of the roads. Shipped from April 29th to May 12th, 110 tons. The ore bins are full due to the difficulty in getting teams. Recent work has opened up a good shoot of ore on the second level—the farthest southern development yet made in this mine. There remains 100 feet to drift before striking the ore shoot of the Portland, which mine is also under Gray's charge. On the second level of the Velvet they have drifted 90 feet in ore, the entire width of the drift. Assay value of the ore is \$20. The output will be increased by this new find, and in addition there

are 1000 tons of fines to ship that will net \$3.50 per ton.

Rossland, May 18.

F. Watson of Spokane, Wash., has a working bond on the Rambler, near Beaverdell, in the Boundary district. A tunnel will be run on the lead for 250 feet, which is expected to bring the heading under the 76-foot shaft at depth of 110 feet.

Diamond drilling on the 700-foot level of the Josie mine last week struck the Annie lode. The Annie vein has been opened up on the 300 and 500 levels west of the dyke. The diamond drill has been moved to the 900-foot level.

G. W. Hughes, of Sandon, manager of the Sunset mine, says he intends to build a concentrator the coming summer at the Trade Dollar mine, above Cody, which is connected by tunnel with the Sunset.

Preliminary work for building an aerial tram line from the Eva mine to Pool creek in Camborne has begun, and it is expected to be in operation by July 31st.

Manager W. Pool, of the Ophir-Lade Co., owning the Oyster-Criterion group on Pool creek, near Camborne, has bought the entire property formerly owned by A. and C. Markay, M. Beaton and W. Stout. These are on Pool and Mohawk creeks, and are divided into three groups, the Sir Wilfred, the Homestead and the Idaho, a total of eighteen claims. They will be operated by the Ophir-Lade Co., which will then have thirty-seven gold claims. The leads are quartz, some carrying free gold. Work on all the groups will begin next week. Power will be had for all purposes from the fall on Mohawk creek, and 500 inches have been bought on Pool creek for the Oyster-Criterion mill. Work on the mill is progressing.

T. McGuigan, manager of the American Boy, near Slocan City, has resumed.

The White Bear M. Co., of Toronto, operating near Rossland, propose to build a concentrator and increase the mining plant. The second level (850-foot level) has shown several bodies of ore which will pay for mining and smelting without concentration, which are being opened up. In addition to the smelting ores, the concentrating ores have been opened up on the 850-foot level. Several sites for the mill are under option. B. MacDonald, of Spokane, is consulting engineer.

At the Spitzee mine, near Rossland, the unwatering is progressing. A larger sinking pump will be placed in the mine.

Surveys have been made for the Kootenay mine's tramway from the workings to the Canadian Pacific railroad, near Trail. The tramway will begin at a point below the lower adit, from which the ore mined in all the levels can be delivered by gravity to the terminal ore bins. It will be automatic and run by gravity, sufficient fall being secured in the mile and a quarter between terminals. The tramway is designed to handle 300 tons of ore daily, and after its completion the output of the mine will be increased to this figure.

The White Bear Co. at Rossland will put in a 20-drill compressor and a 125 H. P. hoisting plant this summer. The Canadian Pacific railroad will build a spur to the mine. It is intended the hoisting plant will suffice for the requirements of the mine to the 1200-foot level, and that its winding capacity can be increased, when necessary.

W. L. Laury, manager of the Green Mountain-St. Louis Con. Co., near Rossland, says additional machinery will be put in at the mine, including another boiler and a hoist capable of going to the 1000-foot level. After these are in, sinking the main shaft will be resumed from the 450-foot level.

On upper Boulder creek, near Atlin, C. D. Newton & Co. propose beginning operations on their hydraulic ground, which, for the first part of the season will be confined to ground sluicing, preparatory to putting in a plant next fall. It is intended to build a reservoir for conserving the water supply.

Superintendent W. Y. Williams says the steam shovel is in operation on No. 1 level of the Knob Hill mine near Phoenix. The shovel is mounted on traction wheels, and its dipper capacity is three-fourths of a yard (one and one-half tons). The capacity of the shovel is 660 yards per day of ten hours. It is fitted with a vertical boiler; size of engines, 7 by 9, duplex. Work has been resumed on the Ruth-Esther gold-copper mine on Sophia mountain, Trail creek, near Rossland, and the company expects to cut the ledge within the next 30 feet. The claims are near the Portland and Velvet mines, and on the same ledge as the Velvet. The tunnel is in 190 feet, and it is expected to cut the ledge at a depth of 150 feet. The vein on the surface shows values in gold and copper.

Arrangements have been made to put in a 30-drill compressor plant for the Nickel Plate mine at Hedley City, Similkameen district.

The Vancouver News-Advertiser says

Sing Lee, a wealthy Chinaman at Clayoquot, has bought the Wreck Bay placers, which about a year ago were deserted by a Seattle man, who had had a number of men at work. Sing has put on thirty Chinamen, developing the claims. They have been too largely worked out to be sufficiently profitable from the white man's standpoint, but may serve for Chinese.

The Lytton M. & Manufacturing Co. has been incorporated to develop the deposits of red and brown ochres on a plateau a few feet above Fraser river, near Lytton. Assays show some gold, and 30% iron oxide. It is intended to mine these deposits for paint manufacture.

The London office has sent orders for reopening of work in Camp Mansfield, at head of south fork of Kaslo creek, near Kaslo, in the Slocan district, after being idle for a year. The Kaslo-Slocan M. Co. are the principal owners. The ores are free milling gold.

J. C. Ryan, of Spokane, Wash., manager of the Soho group of claims in McGulgan basin, says his company has let a contract for driving a crosscut to strike the No. 4 vein on the Soho. As soon as there is sufficient water it is the intention of the Rambler-Cariboo Co. to start its mill. The Antoine is showing in the lower workings 4 feet of high-grade ore.

The Payne Co., at Sandon, is putting up a zinc separator.

C. V. Jenkins, office manager of the War Eagle and Center Star Cos., at Rossland, says on the Center Star and War Eagle 300 men are at work; the Le Roi has 375; Le Roi No. 2, 50, and 50 on the Columbia-Kootenay; the Spitzee has started with a few men, and the Giant is continuing development, and all told there are 900 miners in the camp. The standard scale is \$2.50 for muckers and \$3.50 for miners, per eight hour shift. On the War Eagle and Center Star, however, they are working a contract system, developed by Superintendent C. R. Davis. There men are paid for stopping on the basis of the lineal foot bored. The company furnishes all the material and does the hauling, including the loading of the holes, so that the miners get in a full eight-hour shift. The price for drilling may average from 28 to 30 cents per foot. The rate is fixed by the company. The miners are making from \$4 to \$4.50 per shift. The company furnishes the muckers. The plan seems to give satisfaction to both sides. Le Roi is doing a good deal of development on the contract basis. The War Eagle is shipping 250 tons a day and Center Star 350. E. B. Kirby, general manager of the War Eagle-Center Star Cos., has been experimenting on a wet process which he claims will be successful in milling and concentrating their ore, and the milling plant will be put in this summer.

The Spokane, Wash., owners of the Bluebird mine, in Slocan mining district, near Slocan City, will resume work next month and propose to ship ore. They will sink on the lead an additional 100 feet. From the bottom of this shaft they will drift in both directions.

A rich strike is reported made last week at the Athabasca-Venus mine on Morning mountain, near Nelson. While a tunnel was being driven on the lead a new vein was cut 300 feet in, showing values in gold.

The Morrison mine, near the Mother lode, at Greenwood, resumed operations last week. The Morrison Co. also owns the Atheist mine in Wellington camp. The B. C. mine in Summit camp has thirty-seven men at work. The Oro Denoro has six men stripping the ledge. At the Emma eleven men are at work and the mine is shipping to Trail Junction.

Manager Lane of the Wakefield mine, near Slocan City, is at the mine superintending opening of work after the winter's suspension. The Rambler concentrator has started up and the number of men at the mine increased. The Ruth is expected to put on more men at the mine, and the mill to start up. The Ivanhoe concentrator is running again, says Manager Hickey.

CANADA.

ALBERTA.

A bond has been taken on a group of coal measures 45 miles east of Fernie (B. C.), in the Crow's Nest, near Balmore, by the Granby Smelter Co. of Grand Forks, B. C., and the International Coal & Coke Co. organized under Washington laws, it having been ascertained that coal was of quality for coking purposes. The coal claims have a length of 7 miles, with nine seams, four of which have been prospected, giving an aggregate width of 60 feet of coking coal. Men have been put to work developing in three seams, and arrangements are being made for building coking ovens. The officers of the International Co. are: A. C. Flumerfelt and H. N. Gaier of Grand Forks, B. C., and W. G. Graves of Spokane, Wash.

NOVA SCOTIA.

Owners of coal mines in Nova Scotia profited through the coal strike in the United States last year, says the Boston Financial News. According to the annual report, the coal output in 1902 was 4,362,869 tons, as compared with 3,625,365 tons the previous year. The increase in the production of coke was even more marked, the season's output being 406,000 tons, as compared with 120,000 tons in 1901. Of iron ore 489,000 tons were produced and 28,279 ounces of gold.

MEXICO.

CHIHUAHUA.

The Detbridge-Burr Exploration Co. report a strike of 500-ounce silver ore in the Vencedora mine, near Parral.

W. Adams, manager of Las Minillas mines, 12 miles north of Chihuahua, has started two more shafts, one of which is on the Leona claim, above the former workings. This shaft will be put down on the supposed footwall of the east and west vein, and connect with old workings. Then drifts will be run to crosscut the east and west and north and south veins. The third shaft will be put down at junction of two veins near east side of group and a fourth shaft is also proposed.

The San Toy M. Co., near Santa Eulalia, propose putting in an aerial tramway from the mines down to within 2 miles of the Mexican Central Railroad.

The Chihuahua M. Co. has about finished its pipeline from Hacienda Robinson to the mines at Santa Eulalia, 13 miles distant, and the line and reservoir are expected to be in use by June 1.

M. V. Place, vice-president and general manager of the San Jose M., M. & Railroad Co., at San Jose del Sitio, states the name of the company has been changed to the Pittsburgh-San Jose R. & Co.

R. Emerson of Parral has denounced forty-four pertenencias of mineral ground north of the Las Minillas mines, 12 miles north of Chihuahua.

It is reported the Esperanza mine, in Palmillo Hill, near Parral, has closed down and the idea of striking the Palmillo vein given up.

Boyce & Burnham of Boston, Mass., have bought the Kruger mines at Cusi-huiriachic, the ores being gold-silver. The Moctezuma Lead Co. at Santa Barbara is treating 400 tons of ore daily in its concentrating plant, the increase being due to the putting in of heavier engines.

DURANGO.

The Coronado-Durango M. Co., with head offices in Chicago, Ill., and branch offices at the mines, has been organized; F. J. Lichtenherger of Chicago is manager. At Panuco de Coronado, near the Avino and San Luis mines, they have bought La Union, La Gran Sonora, Zaragoza and Peruana, and have options on several others, the price being reported at \$200,000.

The Penoles M. Co. of Mapimi report having struck coal in their coal land, 60 miles from that place, the diamond drill going through a 4 foot vein of coal at depth of 400 feet. A railroad to these lands is proposed by the company.

The Guggenheim Smelting Co. is reported having plans drawn up for a smelter at Velardina.

GUANAJUATO.

Concessions have been granted on the Guanajuato river, from Guanajuato to Silao, a distance of 15 miles, to G. W. Bryant of Guanajuato, manager of La Luz mines, to work the tailings which have accumulated in the river from patio operations.

GUERRERO.

C. Ackley, a prospector, reports finding in the mountains north of Limon deposits of cinchona which contain from 3% to 5% quicksilver.

OAXACA.

J. T. Franklin and H. M. Atkinson, of Waco, Texas, have bought twenty pertenencias in Zimiltan district, near Ayotlesco, 18 miles south of Ocotlan. They have named the group Franco-Mexicano and organized the Canadian-Mexican G. M. Co. of Waco, Texas. The ore carries values in gold and silver.

SAN LUIS POTOSI.

M. Seitz is operating sulphur mines near Carritos Guadalcázar from which he reports turning out 30,000 tons annually, worth \$22 gold per ton. Besides this, he is prospecting with diamond drill on 3210 pertenencias. Previous to the operation of these mines, the principal supply of sulphur for Mexico came from Popocatepetl.

SONORA.

Near Cucurpe, in the Magdalena district, C. W. Phillips and R. Lewis have located an antigua mine which they have named the Rey del Oro, and will begin development work next week. They have

sunk 200 feet and gone below the old workings, opening a 20-foot ledge of free-milling gold ore, which assays \$13.93 per ton. A mill will be built near the mine.

At the Cerro Prieto mine, near Magdalena, preparations are being made for building a 100-stamp mill and cyanide plant.

M. Latz & Bro. have granted a working bond on their Jobaba mine, 8 miles northwest of Magdalena, to a company of Michigan men, who will develop it and erect a mill.

The 5-stamp mill on the mine of La Loralina M. Co., at Empora Camp, 60 miles east from Magdalena, will be increased to ten stamps, say Tener Bros. & Balch, of Magdalena, part owners. The shaft is 296 feet deep, and will be sunk to a depth of 400 feet, cutting the ore body there.

The Bufo M., M. & S. Co., of Los Angeles, Cal., are putting in a concentrating plant and reverberatory furnaces at their mines near Sahuaripa. The company will still ship its high-grade ore. Development work continues and a pumping plant is being put in.

L. Ginger of Colorado Springs, Colo., and Maine men have incorporated at Augusta, Me., the Gold Coin Meza Mexican M. Co. as a branch of the Gold Coin M., M. & P. Co., which has been operating in Yaqui district.

J. B. Farish, consulting engineer of the Creston-Colorado M. Co., of Las Minas Prietas, denies the reported sale of that company's property to J. W. Gates & Co., of New York.

PERSONAL.

J. B. FARISH, E. M., of Denver, Colo., is in San Francisco, Cal.

J. W. MALCOLMSON of El Paso, Texas, is examining mines in Mexico.

CURTIS H. LINDLEY of San Francisco, Cal., is at Shasta Springs, Cal.

F. J. BUCK has returned to Denver, Colorado, from Las Vegas, N. M.

H. SMITH, president Section 7 Oil Co., returned to Coalinga, Cal., last week.

E. T. WALLACE, E. E., has returned to Yreka, Cal., from San Francisco, Cal.

F. GROTEFEND, of Redding, Cal., is in San Francisco, Cal., on mining business.

M. J. SWISHER is superintendent of the Golden Age mines, near Walistreet, Colo.

TINGLEY S. WOOD of Leadville, Colo., is in San Francisco, Cal., on mining business.

F. L. JOHNSTON of Berkeley, Cal., has gone to Bisbee, Ariz., as assayer and engineer.

P. W. FLEMING, of Tucson, Ariz., is in Globe, Ariz., in the interest of Pacific M. & M. Co.

J. F. BRANDES of Denver, Colo., is examining mining properties near Georgetown, Colo.

G. J. BANCROFT, of Denver, Colo., has returned from examining mines near Yuma, Ariz.

H. W. TURNER of Cherry Hill, Cal., is at Hornbrook, Siskiyou county, Cal., examining mines.

W. S. BROWN of Fremont, Neb., is at Cherry Creek, Nev., examining the North Mountain mine.

L. D. BALL has resigned as superintendent Yreka M. & M. Co., at Rollin, Siskiyou county, Cal.

A. T. HANSEN of Laurium, Mich., of the Copper Glance M. Co., is in Bisbee, Ariz., on business.

G. S. GOODALE, mining engineer for the Victoria copper mine, near Mars City, Mich., has resigned.

H. A. COHEN of the Bully Hill mines and smelter at Winthrop, Shasta county, Cal., is in New York.

A. B. PANE of San Francisco, Cal., is making a tour of the mines of Butte and Shasta counties, Cal.

E. C. VORHEIS, superintendent of the Lincoln mine, near Sutter Creek, Cal., is in San Francisco, Cal.

H. H. DYER, of Leadville, Colo., is manager of the zinc plant of the Utah Metals Co., at Park City, Utah.

C. H. RICE is superintendent Yreka M. & M. Co., at Rollin, Siskiyou county, Cal., vice L. D. Ball, resigned.

W. E. SANDERS is vice-president and manager of the Pulaski G. M. & M. Co., operating near Sumpter, Or.

SUPERINTENDENT C. PUSHER of the

Mountain Maid mine at You Bet, Nevada county, Cal., is in Chicago, Ill.

F. C. CLARK of Salt Lake City, Utah, is superintendent Palmer-Holland group of mines, near Silver City, Idaho.

W. C. ADAMS, interested in the California mine, near Grass Valley, Cal., is in New York on mining business.

C. A. HOLLAND, of Sonora, Cal., superintendent of the Altadena and Starr King mines, is in San Francisco, Cal.

MANAGER KING of the Balsley-Elkhorn mines, near Baker City, Or., is at Baker City from Salt Lake City, Utah.

S. P. SMITH, JR., has resigned as superintendent Ocean Wave coal mine, at Williamsburg, Fremont county, Colo.

A. L. DICKERMAN has resigned as manager of the Utah Metals Co., operating the zinc plant at Park City, Utah.

J. L. JOSEPH, a mine owner and superintendent of the electric plant at Tonopah, Nev., is in San Francisco, Cal.

T. J. OSTER, interested in the Plattsburg group, at Loon Creek, Idaho, is in the East from Salt Lake City, Utah.

G. R. TUTTLE, superintendent of the Golden Gate mine, near Grass Valley, Cal., is in San Francisco on business.

A. S. CHASE, manager Sunrise M. Co., returned to Gold Basin, Snobomish Co., Wash., from a business trip to New York.

W. A. CLARK of Butte, Mont., is in Salt Lake City, Utah, from the mines of the United Verde C. Co., at Jerome, Ariz.

J. F. ATKINSON of Missouri is assistant professor of mathematics in the New Mexico School of Mines at Socorro, N. M.

J. ROSS, JR., superintendent of the Wildman-Mahoney mine, has returned to Sutter Creek, Cal., from Confidence, Cal.

J. H. MACKENZIE has returned to San Francisco, Cal., from an examination of mines at Hayden Hill, Lassen county, Cal.

E. R. ABADIE, superintendent of the Champion M. Co., has returned to Nevada City, Cal., from San Francisco, Cal.

C. R. DOWNS, superintendent of the Bunker Hill mine at Sutter Creek, Amador county, Cal., is in San Francisco, Cal.

E. M. BRAY of Ely, Nev., who is interested in the Nevada and New York copper mines, near Ely, is in San Francisco, Cal.

E. H. BENJAMIN, E. M., has returned to San Francisco, Cal., from the Golden Eagle mine, Hayden Hill, Lassen county, Cal.

J. WITHERLY, superintendent of the Socorro mine, southwest of Wickenburg, Ariz., is at Los Banos, Cal., for the summer.

F. C. LINCOLN of Colorado has been elected to the chair of metallurgy in the New Mexico School of Mines at Socorro, N. M.

J. H. TOWNE of Pendleton, Ind., vice-president Indiana G. & S. M. Co., operating near Georgetown, Colo., is at their mines.

J. STEWART is superintendent Ocean Wave coal mine at Williamsburg, Fremont county, Colo., vice S. P. Smith, Jr., resigned.

G. KELLOGG of Bakersfield, Cal., interested in the Kern river oil fields, is examining oil properties in Evanston, Wyo., oil district.

SUPERINTENDENT J. A. PARKER, of the El Dorado C. Co., is in Georgetown, El Dorado county, Cal., from San Francisco, Cal.

E. SMITH and W. P. DUNHAM, owners in the Consuelo M., M. & P. Co., at Dolores, Chihuahua, Mexico, are in Los Angeles, Cal.

WM. M. KERKHOFF of Minneapolis, Minn., is visiting mines in which he is interested at Batamote, near Bonanilla, Sonora, Mex.

A. N. BUTTS of San Francisco, Cal., who has had charge of the erection of a mill in Wisconsin, was in Denver, Colo., the past week.

PRESIDENT TODD, of the Quincy M. Co., returned last week to Boston, Mass., from a trip of inspection to their mines at Hancock, Mich.

G. A. BETHUNE has returned to San Francisco, Cal., from a trip to Searchlight district, Nevada, and Ballarat district, California.

H. JOHNS has resigned as manager of the Sunset mine of the Montreal & Boston C. Co. at Greenwood, B. C., and goes to Colfax, Wash.

S. JAMES has resigned as superintendent of the Arkansas Valley smelter at Leadville, Colo., and is general superin-

tendent of the smelter at Salida, Colo., and also of the Republic smelter at Leadville, Colo.

E. M. BINFORD, has resigned as superintendent of the Carls mine, near Eureka, Juab county, Utah, and has gone to Salt Lake City, Utah.

J. E. MILLER of San Francisco, Cal., part-owner in the West Point mine, at Deadman's Flat, near Grass Valley, Cal., is at Grass Valley.

F. FOURNIER, managing owner of the Dos Estrellas mine in El Oro camp, Mexico, Mex., is making an extended visit in the United States.

R. WHINNERAH, former superintendent of the Humphrey mill, Creede, Colo., will have charge of the Mountain Pride mill at Breckenridge, Colo.

E. S. SAFFORD, chief engineer and manager of the Pittsburg-San Jose R. & E. Co., returned to Chihuahua, Mex., from the East last week.

H. G. HEFFRON, formerly with the Bingham Con. Co. at Bingham, Utah, is manager of the Gold Roads mines and mill near Kingman, Ariz.

C. H. TALLMADGE is manager of the Golden Age group, near Wallstreet, Boulder county, Colo., owned by H. E. Simmons & Co. of New York.

T. H. OXNAM has been reappointed manager of the Palmarejo mines at Palmarejo, Mex., from which position he resigned some months ago.

A. E. STAHLER is manager of the Belmont-Middle Mountain-Fairplay group of mines at Winfield, Chaffee county, Colo., vice A. E. Bokman, resigned.

C. H. GITSCH has resigned as superintendent California mine, Park City, Utah, and will devote his attention to development of the Woodside group.

J. W. TAYLOR of Salt Lake City, Utah, is in Columbus, Ohio, on business connected with the Wild Bill M. Co. at Shantie, Beaver county, Utah.

J. C. CARERA of Mesilla Park, N. M., returned last week from an examination of the Encinillas mines, 50 miles east of Santa Rosalia, Chihuahua, Mexico.

H. T. POWER, superintendent of the Hidden Treasure drift mine at Sunny South, Placer county, Cal., has returned to the mine from San Francisco, Cal.

C. M. FUELLER, mining engineer, Denver, Colo., has returned there from a trip through Georgia and Alabama, where he has been examining mining properties.

T. MALTMAN of Angels, Cal., is in San Francisco, Cal., and will sail next week for Nome, Alaska, to take charge of the Anvil-Sunrise mine, in which he is interested.

W. BLAKEMORE, former superintendent of the Crow's Nest Pass Coal Co., operating at Fernie, Morrissey and Michel, B. C., is consulting engineer of the same company.

F. T. KELLY, superintendent of the I X L and Hidden Treasure mines, in the Greenhorn mountains, near Sumpter, Or., returned last week from an extended stay in Spokane, Wash.

G. D. DOVETON of Doveton & Purington, Denver, Colo., has left for Torres, Mexico, on metallurgical work for the Creston & Colorado Co., and expects to be absent about three months.

C. E. MAGNUSON, Ph. D., has been appointed to the newly established chair of physics and electrical engineering in the New Mexico School of Mines at Socorro, N. M. He is a graduate of the University of Minnesota, department of electrical engineering, and of the University of Wisconsin, where he was a fellow in physics.

Commercial Paragraphs.

THE Brown Corliss Engine Co. of Corliss, Wis., are looking for a number of good agencies to handle their work in different parts of the country.

C. M. FUELLER, mining engineer of Denver, Colo., reports that he is designing a 500-ton mill for Georgia, a 100-ton mill for Boulder, Colo., and a 150-ton mill for Old Mexico.

In a plant recently installed in the South by the Pneumatic Engineering Co., 123 Broadway, New York, the air lift system pumps 9,000,000 gallons of water per day from four 10-inch wells.

THE Alpine Con. G. M. Co., whose office is in Baker City, Or., and whose mines are near Sumpter, Or., has recently

placed an order through their manager, J. T. Grayson, with the Rison Iron Works of San Francisco, Cal., for a complete 20-stamp mill, to be operated by steam.

Books Received.

Report of Secretary of Mines for Tasmania for 1901-02, including reports of commissioners of mines, inspectors, geologists, etc. It forms an interesting volume descriptive of Tasmania's mineral resources.

"The Copper Hand Book," for 1902, by Horace J. Stevens. This is the latest edition of this valuable annual publication. It is devoted to a popular, scientific and practical description of copper mines and metallurgical works, and devotes considerable space to the uses of copper. The geology of copper deposits throughout the world is one of the most interesting features of the work, and the list of copper mines with accompanying data one of the most valuable. 600+82 pages. Price \$5 in buckram binding. Horace J. Stevens, publisher, Houghton, Mich.

The second edition of "Lindley on Mines" has been received, and forms two volumes constituting 2150 pages of valuable text on the mining law of the United States. The volumes are profusely illustrated and contain all the important mining decisions of the United States Supreme Court up to date. The work has been entirely revised, and as the author states, the new adjudications have been assimilated to the old sections, and where new subjects have been incorporated supplemental ones have been appropriately grafted into the treatise without disturbing the general plan of arrangement or the logical sequence of the sections. Where the subject under consideration would seem to justify or require it additional diagrams and illustrations have been utilized. It will be gladly welcomed by the legal profession everywhere, as the work is an undisputed authority on the important subject of which it treats—the mining law. Price in calf, \$15.00; Bancroft-Whitney Co., San Francisco, Cal.

Obituary.

C. SHAD, a pioneer miner and operator on the Comstock, died at Carson, Nev., on May 15. Deceased was 80 years of age and a native of Germany. He leaves a wife in San Francisco, Cal.

C. B. BARSTOW, a pioneer mining man of California, died May 13 at Glencoe, Calaveras county, Cal., of heart failure, aged 80 years. Deceased was a native of Maine and a graduate of Bowdoin College.

J. BENNETT, a pioneer miner of Sierra and Nevada counties, Cal., died at Grass Valley, Cal., May 14th. He was at one time interested in the Gold Hill mine, near Grass Valley. He served several terms as city trustee and one term as county tax collector. Deceased was born in Cambourne, Eng., in 1821.

W. H. RODDA died on May 9th at Kalgoolie, West Australia. Deceased was formerly interested in mines in Nevada county, California, having been superintendent of the French Lead mine, near Grass Valley. He was later superintendent of the property after it changed its name to the North Star. Deceased leaves a wife, two sons and two daughters.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

PNEUMATIC PRUNING SHEARS.—No. 143,578. Feb. 18, 1903. W. Young, San Francisco, Cal. This invention is designed for trimming and pruning trees, hedges and the like, and has reference particularly to such shears as are actuated by compressed air or other suitable impelling fluids. Its object is to provide a labor saving device which will be more powerful and more efficient than the hand actuated devices commonly in use. The whole apparatus is made light enough to be easily carried about by the operator and held in his hands, and manipulated above his head in the manner customary in pruning trees and shrubbery.

PNEUMATIC PRUNING SAW.—No. 143,579. Feb. 18, 1903. W. Young, San Francisco, Cal. This invention relates to improvements in apparatus for trimming and pruning fruit trees and the like, and has reference particularly to a portable sawing device which is operated by compressed air. Its object is to provide a convenient, light and portable engine and saw which may be easily held in the hands, and by which limbs and branches too large for pruning shears and inconvenient of access for hand sawing may be severed with ease and in far less time than they could have been by ordinary pruning or hand sawing methods.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 12, 1903.

727,871.—MILEAGE TICKET HOLDER—E. R. Allen, Prescott, Ariz.
727,880.—TELEPHONE DIRECTORY—L. M. Bannan, S. F.
727,736.—DENTAL DRILL—C. R. Basford, Healdsburg, Cal.
728,153.—GAS REGULATOR—G. S. Bennett, S. F.
727,739.—CROSS HEAD—F. H. Blanding, S. F.
727,743.—OIL COCK—Brunner & Patterson, Hayward, Cal.
727,745.—CORNICER BREAKS CUTTER—G. R. Hyde, Fresno, Cal.
727,759.—WIPE ROPE SOCKET—Double & Katten, Los Angeles, Cal.
728,096.—SPIKE PULLER—O. Giltner, Portland, Or.
727,958.—ORE CRUSHER—J. A. Johnson, Los Angeles, Cal.
728,115.—INK WELL HOLDER—J. C. Killey, San Diego, Cal.
727,802.—STAMP MILL—C. C. Lane, Los Angeles, Cal.
727,993.—BATH BRUSH—T. L. Newport, S. F.
728,127.—BOTTLE—M. & M. B. O'Meara, S. F.
728,036.—LETTER STAMPING MACHINE—J. N. Stacy, Portland, Or.
727,712.—AWNING—F. Thomas, S. F.
728,147.—TELEPHONE SELECTING DEVICE—W. D. Watkins, San Jose, Cal.
728,068.—PNEUMATIC PRUNING SHEARS—W. Young, S. F.
728,069.—PNEUMATIC PRUNING SAWS—W. Young, S. F.

Latest Market Reports.

SAN FRANCISCO, May 22, 1903.

METALS.

SILVER.—Per oz., Troy: London, 26d (standard ounce, 925 fine); New York, bar silver, 54½c, refined (1000 fine): San Francisco, 54½c; Mexican dollars, 40 @ 42½c San Francisco, 43c New York.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50 @ 14.75; Electrolytic, 1 to 3 casks, \$14.50 @ 14.75; Casting, 1 to 3 casks, \$14.50 @ 14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £62 12s 6d spot per ton.

Copper remains unchanged, the demand and output seemingly being without material fluctuation.

The following gives the figures of the consumption of foreign copper in Germany for January-March, 1903, compared with the same period of 1902 and 1901:

	1903	1902	1901
Imports, tons.....	19,590	17,427	16,502
Exports, tons.....	2,942	2,298	2,389

Consumption, tons.....16,648 15,129 14,113

LEAD.—New York, \$4 37½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½; pig, \$4.75. London: £11 12s 6d per long ton=2.75c per lb.

SPELTER.—New York, \$5.75; St. Louis, \$4.60; London, \$2.00 17s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$29.45 @ 29.65; San Francisco, ton lots, 31½c; 500 lbs., 32c; 200 lbs., 32½c; less, 33c; bar tin, \$35 @ 37½c. London, £134 spot.

PLATINUM.—San Francisco, crude, \$18.00 @ 19c; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.50 @ 46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 @ 46.00; 76½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 31c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17.15c.

NICKEL.—New York, 50 @ 60c @ 1b.; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$20.60 @ 21.50; gray forge, \$19.85; San Francisco, bar, 3c @ 1b., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31.50; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 1½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c @ set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2.50 @ 2.75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, 3c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 4c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

CHEMICALS.—Cyanide of potassium, 98½-99½, jobbing, 25 @ 26c @ lb.; carloads, 23 @ 24½c; in tins, 35c; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 2½ @ 2½c @ lb.; caustic soda, in drums, 3 @ 4c @ lb.; Cal. s. soda, bbls., \$1.25 @ 1.50 @ 100 lbs.; sks., \$1.05; chlorate of potash, 12 @ 13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; horax concentrated, 7 @ 8c @ lb.; roll sulphur, 4 @ 6c; powdered sulphur, 2 @ 3c; flour sulphur, French, 2 @ 3c; alum, \$2.00 @ 2.25; California refined, 2 @ 2½c; sulphide of iron, 9c @ lb.; copper sulphate, 5 @ 7c; chloride of lime, spot, \$2.50 @ 2.75; sulphuric acid, in carboys, 66½ B, 2½c @ lb.; nitric acid, in carboys, 8c @ lb.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @ 9c per lb.

BONE ASH.—Extra No. 1, 5 @ 6c per lb. No. 1, 4 @ 5c.

BORAX.—Concentrated, 7 @ 9c per lb. powdered, 9 @ 12c; fused, 25 @ 30c.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5 @ 7c.

MANGANESE.—Pure, 1½ lb., 60c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

BISMUTH.—Subnitrate, per lb., \$1.60.

SODIUM.—Metal, 1½ lb., \$1.00.

MERCURY.—Bichloride, 1½ lb., 90c.

PHOSPHORUS.—(American) 1½ lb., 75c.

SILVER.—Chloride, 1½ oz., 90c @ \$1.00; nitrate, 55c.

URANIUM.—Oxide, 1½ lb., \$3.50.

ZINC.—Metallic, chemically pure, 1½ lb., 50c; dust, 1½ lb., 10c; sulphate, 1½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

MINING AND SCIENTIFIC PRESS

Whole No. 2236.— VOLUME LXXXVI.
Number 22.

SAN FRANCISCO, CAL., SATURDAY, MAY 30, 1903.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

Copper Production in Lake Superior Region.

All who are at all familiar with the mining world know more or less of the Lake Superior copper mines. They are noted for their long continued and large output and for the great depth to which some of the mines have been worked (4938 feet the deepest shaft, the Tamarack No. 5). The district at present is producing about 350 tons of metallic copper daily,

years since. It has been frequently stated that the Homestake mines in South Dakota have about 900 stamps crushing over 3000 tons of gold ore daily, and the Alaska-Treadwell has 540 stamps crushing about 2000 tons daily.

In the Lake Superior region 75 steam stamps crush every 24 hours from 350 to 500 tons per stamp, in the aggregate crushing of the entire output of the mines as stated above—27,000 tons. In the crushing and concentration of this large amount

will be about 4900 feet vertical below the collar of the shaft. The Tamarack mine has five shafts, all of which are vertical. No. 1 cuts the conglomerate at 2270 feet; No. 2 is 4250 feet deep; No. 3 is down 4799 feet; No. 4 is 4450 feet deep, and No. 5, the deepest vertical shaft in the world, is 4938 feet below the surface. It was commenced in August, 1895, and reached the conglomerate in December, 1901, at 4662 feet. The Calumet & Hecla mine is the largest and most extensively operated mine in the Lake

Upper Terminal, Tramway Nimrod Syndicate, La Quinua, Peru.

Town of La Quinua, Peru.

Mill of Nimrod Syndicate, La Quinua, Peru.

nearly all by wet concentration, there being little copper ore in the district which does not occur in the form of native metal. The output has fluctuated largely in the past, but at present is the heaviest ever made since the discovery of the mines. The daily shipments of ore from the mines to the mills, some of which are many miles apart, now aggregate nearly 27,000 tons, and nearly all of this is mined underground from veins only a few feet in width.

Where large tonnage is mentioned in mining operations, one usually thinks of large open cuts or quarries; but the Lake Superior mines, with few exceptions, passed the surface-mining stage many

of ore, nearly 320,000,000 gallons of water are required, or about 50 tons of water for each ton of rock crushed, as compared with 3½ to 5 tons employed in stamping ordinary gold ore. A large amount of this water is used in the various concentrating operations through which the ore passes after crushing. Some of the pumping plants at these mines have a capacity of exceeding 130,000,000 gallons daily.

The temperature at the bottom of some of the deepest shafts is 75° to 80° F., after connection had been made with distant shafts by means of levels. The Calumet & Hecla No. 4 shaft, an incline, is 6900 feet deep. It is intended to sink to 8100 feet, which

region, and produces more than 50% of the output of the district, and about 8% of the entire output of the world. The rock at present contains about 2½% metal; or 50 pounds metallic copper to the ton of ore. The working force of the mine is about 5000 men, including miners, mill men, smelters, those engaged in transportation, the hydraulic branch, clerical force, etc.

In Lake Linden, where the tailings from the Calumet & Hecla mine have accumulated, it is estimated there are 25,000,000 tons of sand which contain from 0.5% to 1% of metallic copper. Experiments are being made with a view to reconcentrating.

The Passing of a Mine.

Recent press dispatches state that the Cliff copper mine in Keweenaw county, Mich., is to be dismantled, after an idleness of many years. The Cliff was one of the noted early mines of the Lake Superior copper region. It was not on one of the conglomerate or amygdaloid beds, but upon one of the fissure veins of that interesting district. The fissure is said to have been worked out, or, at least, worked until it was no longer profitable. It paid its first dividend in 1849. The Cliff mine in its early history was a noted producer of mass copper. The large and profitable production of metallic copper by a number of mines in the Lake Superior region has been a powerful stimulant to the deep exploration of mines in that district. Not all of these enterprises have proven all that had been hoped for them, but a fair percentage have proven remunerative. Recently it has been said that with great depth the copper-bearing conglomerates show poorer values than nearer the surface, but it has not yet been proven that this is not merely a local condition, and that an improvement may not occur at still greater depth. Great mines have been closed before, and in some cases they have been reopened with satisfactory results to the operators, but in the case of the Cliff mine, the impression seems to prevail that it has actually been worked out.

THE recent session of the Idaho Legislature passed what is known as the "Pure Food law," in which a clause of the act prohibits the sale of oil and gasoline less than 150° fire test. Gasoline used in engines is usually far below this point, being generally from 70° to 80°. This act has resulted in shutting down several mills where gas engines were used for power. While it is always desirable to have illuminating oil and other petroleum products as high proof as necessary, it is not absolutely clear how these commodities came to be classed as "pure food."

Value of Mine Surveys.

Mining engineers know and appreciate the value of accurate mine surveys and maps, and most mines have maps which will answer all practical purposes, but there are those without them. A full set of maps must embrace level maps, and vertical longitudinal and vertical cross-sections of veins which have any considerable dip.

It is the practice to plot a general plan of the "underlay" on a single sheet, showing each level in the mine, with all its details of development, winzes, raises, crosscuts and stopes, each being indicated by characteristic marking. The idea of projecting plan and vertical section on a single plane, as attempted occasionally, is unsatisfactory, and is never done by those familiar with the principles of mine mapping. The scheme of mapping each level separately, each level map drawn to a certain datum, is an excellent one, and tracings of these several level maps may be made, which admits of binding them together permanently or temporarily, and the lines showing the several levels may then be examined simultaneously by placing the sheets one above another, and the relative position of the workings on adjacent levels studied.

By plotting all the development work, and also the structural geological features (such as changes in character of rocks through which the workings pass, the dip of the formation, all dikes intersecting the workings, cross veins, seams, faults and gouges, together with their strike and dip), the maps may be made to serve their greatest usefulness. The breaks in the vein, which occur on any particular level, may be referred to levels above and below, as does any other geological irregularities which may occur. The lack of just this sort of knowledge has sometimes resulted in closing mines subsequently proven to be valuable.

Never, perhaps, is an accurate mine map appreciated so greatly as upon the reopening of a long abandoned property. Such mines are usually flooded, and when new work is undertaken, as connecting with works of an adjoining property, or sinking a new shaft to be connected with the old workings, the element of danger which attends such operations, owing to large volumes of water in the old works, is reduced to a minimum. The manager knows how far he is from the old levels or stopes, and can anticipate imminent danger and provide against it.

Accurate maps are also of great service in searching for new ore shoots, as by their use a comprehensive idea of the entire vein may be obtained, for a glance at the map places the development of several thousand feet possibly immediately under the eye, and the relations of the various portions of the mine become apparent.

The Labor Situation.

There are at present said to be more idle men in industrial lines than at any time since the coal strike of 1902. The number is estimated at more than 50,000, mostly in the States east of the Rocky mountains. On the Pacific coast there are a few hundred railroad and other laborers idle—on strike. In the mines of the West, however, there is no disturbance of moment, except in the coal mines on Vancouver Island.

In Arizona the eight-hour law passed by the last territorial Legislature becomes operative June 1st, and the developments of the immediate future are looked forward to with some concern by mine managers and owners in that Territory. It is reported from several districts of Arizona that the operators will not deny the demands of the miners should they attempt to insist upon putting the law into active operation, but miners throughout the Territory have been notified that beginning June 1 wages will be reduced 25 to 50 cents per day, the present rate being \$2.75 and \$3.50. This step was taken at a recent meeting of the Mine Operators' Association, presumably in anticipation of the proposed eight-hour day. The convention of the Western Federation of Miners, in session at Denver, Colo., has instructed delegates from Arizona to accept no reduction in wages, consequently the outlook for continued prosperity in Arizona is not bright.

In California the miners in Calaveras and Amador by the recent strike secured a nine-hour day for

ten hours' pay, and it is now stated to be the intention to demand an eight-hour day for the same pay. They are in the meantime strengthening their organization, and notices have been posted in the several mining towns and at the mines, in the English, Italian and Austrian languages, directing all men employed in or about the mines who have not already joined the union to at once affiliate themselves with some labor organization, or they will be boycotted as "scabs."

There are few of the mines in the district affected by this movement that can afford any additional expense, and a demand for still shorter hours would undoubtedly result in closing some of the mines of the district, with the further probability that in the case of some of them they would not again be reopened by the present generation.

In view of the present situation, it is hoped that wiser counsel will prevail and that the miners will see the inadvisability of adding to the burden of expense under which these mines are already struggling.

Gwin Mine Annual Report.

The annual report of the Gwin mine, Calaveras county, Cal., for the year ending March 31, 1903, has just been issued, and shows some interesting figures as to total cost in mining and milling, and also in the several departments of the mine. The report, while giving an itemized statement of costs, makes no mention of the results obtained, but this fact does not in any manner affect the cost of operating. The Gwin mine is worked through a well equipped vertical shaft, about 1800 feet in depth. The mill has 100 stamps and the rock is somewhat softer than the average of the mines of this portion of the California gold belt. The vein varies from 4 or 5 feet to over 20 feet in width. The workings are promptly and substantially timbered and the practice of filling is carried on as close after stoping as convenient, as the ground is very heavy and cannot be held with timbers alone. The management is progressive, and many innovations and labor-saving devices have been introduced. Following is the report of the secretary for the fiscal year ending March 31, 1903:

ITEMS.	Mined and sent to the mill, 135,033 tons.	Cost per ton.	Milled and concentrated, 135,393 tons.	Cost per ton.

* 1% per month written off these accounts for deterioration.
† Apportioned according to its estimated life or utility.

There were 2010 831 tons sulphurets (less moisture) produced. Wagon and railroad freight, loading wagons and cars, and Selby Co.'s charges amounted to \$21,981.17, being \$10.331 per ton of sulphurets or \$0.1588 per ton of ore milled.
Total cost of production and treatment per ton of ore: Mining and development work, \$1.9443; milling and concentration, \$0.30608; sulphurets, Selby's charges, etc., \$0.1588. Total, \$2.4031.

It is stated by the English press that the government of the Malay States will impose a duty on tin stone exported from the Straits mines, the object being to discourage the shipment of tin ore from those mines to America for reduction, and to encourage the erection of reduction works on the peninsula for the treatment of the ores there. This may be true, but it seems improbable. It is further stated that tin bars or plate produced in the Malay districts will not have to pay any export duty.

CONCENTRATES.

It is never safe to buy stock in a corporation which pays an unearned dividend.

A TEMPERATURE of 302° F. in a boiler is equivalent to a gauge pressure of 55 pounds.

WITH suitable nozzle, a good hydraulic giant, under 265-foot pressure, would throw 500 inches water.

THERE is no legal authority under which public lands may be leased from the Government for mining purposes.

AT 30 inches barometric reading, a troy pound of distilled water equals 22.7944 cubic inches; avoirdupois, 27.7015.

SOUND has been transmitted by the rays of a searchlight a distance of 4 miles, and the radiophone has been in use for some time, but not in a practical way.

A "STORAGE BATTERY" does not store electricity. Electricity can no more be "stored" than can sunshine. What is called a "storage" battery is really a reversible battery.

AN individual can relocate "his own mining claim" under an assumed name, without violating any statute; but there are some things concerning which statutes should be unnecessary.

WHERE both parties claim under the same location neither one can contest its validity. A location may be made by an agent, and this without the knowledge or consent of the principal, if he afterwards accepts the location.

THE rock specimens from Argenta, Montana, are white quartz, slightly stained with iron oxide. The lead-colored mineral with metallic luster is molybdenite, (sulphide of molybdenum); the silvery-white scales are muscovite mica.

WHEN a mill is built of lumber that has not been thoroughly seasoned it is well to line up the shafting occasionally during the first year or two, as the tendency of some timber to warp upon drying will throw shafting out of line.

A PART owner of a patent has the legal right to convey to others the right to use, make and vend the patented article without the consent of his co-owner, and the latter cannot maintain a suit for infringement against the grantees.—108 Fed. Rep. 77.

THE ore sample from Jacksonville, Or., is specular iron, a variety of hematite. It is doubtless a good quality of ore, but the vein described is too small to be commercially valuable for iron. It may contain gold, as this ore sometimes does in gold mining regions.

THE specimens received from Kernville, Kern county, Cal., are native antimony, which rarely occurs native, there being not more than a half dozen localities cited by the authorities. They are chiefly valuable owing to the rarity of the occurrence of the native metal.

THERE are engines now running which can take a train of 300 tons, exclusive of the weight of the engine and tender, along a straight, level road at the rate of 50 miles an hour for as long a time as the supply of coal and water will hold out—not a spurt, but a long-sustained effort. The same engine is quite capable of developing over 1000 I. H. P.

HOISTING ROPES are made usually of six strands of nineteen wires in each strand, the several strands grouped around a tarred hemp core. An inch rope of this description weighs 1.6 pound per running foot. A rope 1½ inches diameter weighs 2.5 pounds per foot. The latter rope, made of crucible cast steel, would have a breaking strain of about fifty-five tons.

"BALL STAMP" is the name given to the heavy steam stamps employed in the crushing of the metallic copper-bearing rock in the Lake Superior region. These stamps weigh each several thousand pounds and have a capacity of 500 tons and upwards per day. When it is said a mill has "three heads" in operation it is meant that three Ball stamps are crushing ore.

A HOISTING ENGINE may be set directly upon the concrete or masonry foundation, (former preferred). The bed plate may be set in place and raised slightly by placing thin metal shims, ½ to 1 inch thick, depending on width of bed-plate, and run in a thin mixture of cement and sand, which should be carefully spread under the bed-plate and so arranged that it will completely fill the space. Allow to set for several days before running.

NEITHER the laws of Arizona or of any other State or Territory require that additional assessment work be done on a mining claim when an amended location is made unless the change in boundaries of the claim result in placing the work already accomplished entirely out-

side of the limits of the amended location. The amended location must be recorded, and any work previously done under the original location stands for the amended location.

WHERE a director of a corporation performed services as its manager, not pertaining to his duties as director, he is entitled to recover the reasonable value of such services, though no rate of compensation was fixed by the board of directors prior to performance of the services. No legal quorum of directors of a corporation is present when action is attempted to be taken on a matter as to which one of the directors necessary to make the quorum is interested, and resolutions passed at such meeting can not be ratified by the stockholders.—64 Pac. Rep. (Cal.) 1082.

WHEN A locates one or more mining claims the title rests in him, and if he subsequently transfers an interest in these claims to B and C the title still rests in his name, but the transfer should be placed on record, the same as any transaction in real estate, and this secures B and C in their interest in the claims. It is not necessary that the names of B and C appear on the location notice. An amended location notice and record of same may be made, but this is unnecessary. B and C, however, become equally responsible with A for continuance of annual assessment work.

IN any system of incandescent lighting by multiple arc, or parallel arrangement, when one lamp is on, the resistance is such that only the current required for that lamp can flow; when two lamps are turned on, the resistance is half of what it was before, and twice as much current flows. More power is therefore required of the generator. If no lamps were lighted, the generator would not be called upon for any current, and it would run free, offering no resistance to motion except the friction of its armature shaft. This is true of all dynamos, alternating or direct.

GRAPHITE is pure carbon when the mineral itself contains no impurities. It occurs massive, earthy and crystalline, often found in disseminated grains and scales in slates, granite, limestone and other rocks. The mineral may be concentrated and both wet and dry processes are used for this purpose, the former being preferred. The ore is crushed wet by means of stamps, followed by a rough concentration on stationary buddles, the concentrates being dried and further crushed and ground with buhr stones. In some mills the mineral is obtained by collecting the graphite from the surface of the water, where it floats after fine crushing.

ALUMINUM is manufactured from its oxide by electrolytic decomposition. Its specific gravity is 2.68. Its tensile strength varies from 22,000 to 30,000 pounds per square inch. Its electrical conductivity is higher than that of any other common metal, excepting copper, in proportion to its cross-section, and is more than twice as great as copper for equal weights. The relative price is determined by the electrical conductivity. Aluminum conductors will cost the same per mile as copper of equal conductivity if the price per pound of copper is 47.77% of the price per pound of aluminum. Copper wire, for electrical purposes, at 15 cents per pound, is equal to aluminum wire at 31.4 cents.

THE silver ores of California usually carry little gold, sometimes none at all, as in the Calico district, San Bernardino county. In the lead-silver ores and other ores containing sulphides, carbonates and oxides of the base metals, with silver values, gold is usually present and in some cases amounts to more than the silver. It has not been demonstrated that there is definite ratio of gold to silver in any of the California ores. This particular phase is more characteristic of districts than of certain ores. It would be quite possible to find silver values ranging from 7 ounces to 12 ounces, with merely a trace of gold, though no such occurrence is known to "Concentrates" in Calaveras county, Cal.

PHOSPHORUS is an element, widely distributed, occurring only as phosphates. It is present in sea water in minute quantity, but no attempt, so far as "Concentrates" knows, has been made to extract phosphorus from sea water. The phosphorus of commerce is obtained by treating burned bones with sulphuric acid, when an insoluble calcium sulphate and a soluble acid calcium phosphate are formed. The solution of acid calcium phosphate is filtered, evaporated to dryness, and the residue is heated to change the acid salt into the metaphosphate. The calcium metaphosphate is then intimately mixed with charcoal and heated to redness in earthen retorts and the phosphoric vapor is condensed in water. Phosphorus is also manufactured from mineral phosphates. Phosphorus is insoluble in alcohol and water. Because of its inflammability it is kept under water.

IN the Transvaal, South Africa, the ore-bearing formations follow a plane parallel to the sedimentary deposits and dipping slightly to the south. Considerable drilling has been done to demonstrate the value of the reef at great depth. The deepest hole drilled has a depth of 4800 feet, and at that depth found the reef with good values at a point only 25 feet from that at which it was theoretically expected that the reef would be cut. This hole was started before the war, in January, 1899; but at the beginning of October, 1899, on account of the war,

the company was obliged to stop working. For twenty months the rods were left idle in the hole. The work of sinking deeper was resumed in January, 1900, and continued until the depth of 4800 feet was reached and the permanency at that depth of the rich deposits of the Rand mines proved. The hole was put down in 10½ months of actual drilling.

F. L. BOSQUI recommends as a suitable flux for cyanide precipitate after acid treatment: With every 100 parts of precipitate is mixed 50 parts of a flux containing 4 parts borax, 2 parts soda and 1 part sand, but as he says, owing to the complex character of the zinc precipitate, a suitable flux can only be determined after a good deal of practical experiment. On this same subject Alfred James says: "The fluxes used (in smelting auro-cyanides) vary at each works in accordance with the condition of the slimes. When these are fairly pure they are melted with one-third to one-half their weight of fused borax and about one-tenth sodium carbonate; to this is added a little sand if necessary. Zinc, copper or other metallic impurities require the addition of more borax; old slags from previous fusions are added with advantage. Fluorspar is sometimes used. The borax should be ground borax glass."

THE smelting of antimony ore is attended with difficulty, and but few metallurgists are thoroughly familiar with the details of modern practice. In a general way, it is sufficient to state that the sulphide of antimony (stibnite), which is the principal ore of the metal, is melted with wrought iron scraps, in which the sulphur of the stibnite combines with the iron, leaving the metallic antimony, or the ore is roasted, whereby the sulphur burns to dioxide, and the antimony becomes an oxide, which is reduced by fusion with coal. The molten metal after being purified is poured, together with an easily fusible slag, into a heavy iron mold. The antimony solidifies first and its upper surface is characterized by a network of fern-like forms—an incipient crystallization, which is required by buyers as an evidence of the purity of the metal. The United States Geological Survey reports no antimony ores mined in the United States in 1902.

THE most common terms in use to represent electrical units are the ohm, the volt, the ampere and the watt. These were given international standard value by the International Electrical Congress in Chicago, 1893. As fixed by that convention, the ohm is represented by the resistance of a column of mercury, at 32° F., of a mass of 14.521 grams, and of constant cross-section throughout the length of 106.3 centimeters. The international ampere is represented by the constant current which, when passed through a solution of nitrate of silver in water, of a certain percentage, will deposit silver at the rate of 0.001118 gram per second. The international volt is that electro-motive force which will produce a current of one ampere through a resistance of one ohm, and is represented by 1/1000 of the electro-motive force between the terminals of a dark cell. The watt is the amount of work done per second by a current of one ampere through a resistance of one ohm.

TO DETERMINE the amount of lead in an ore, where because of an unusual percentage of copper the ordinary fire assay is not satisfactory, the ore or matte is first treated with nitric acid, the solution then diluted and filtered, precipitation effected by sulphuric acid, throwing down sulphate of lead, sulphate of baryta, sulphate of strontia and sulphate of lime. The precipitate is then washed down to the point of the filter with water, to which two drops of sulphuric acid are added, then dried. The dry precipitate is placed in a small clay annealing cup, the filter ignited, the ashes added to the precipitate in the cup. Cyanide of potassium, equal to about five times the weight of the precipitate, is then added and the whole of the contents of the cup fused at a low heat over a spirit lamp. The lead sulphate is soon reduced to metallic lead, settling in the bottom of the cup. The cup is allowed to cool, and then, with the contents, placed in a porcelain dish with water. The cyanides then dissolve, leaving the metallic lead, which is dried and weighed.

THE resistance which a flywheel offers to the air may give rise in some cases to a considerable waste expenditure of energy. In experiments at a station at Nuremberg, Germany, where two tandem compound engines of 450 H. P., direct coupled to the dynamos, were working at ninety-five revolutions per minute, to equalize the running with the great variations of load which occur, a very heavy flywheel was used with the arms of a channel section. These arms were found to offer a great resistance to the air, and to create a powerful draught. It was decided to cover the wheel with sheet iron to reduce the resistance and thus gain power. To test the amount of energy lost, the dynamo was made to run as a motor and thus drive the engine and flywheel at no load. When the latter had no protecting cover it was found to absorb 13,300 watts, but when the covering was replaced it took only 9874 watts, thus showing a gain of 3426 watts, or 5.7 H. P., this being 1.2% of the power of the engine. Counting the current price per kilowatt hour and a day's run of seventeen hours, it was calculated that this represented an economy of nearly \$300 annually. Another test of a similar nature was made upon a 630 H. P. engine, and showed an economy as high as 30 H. P., or 4.8% of the engine power, which was gained by properly diminishing the air resistance of the flywheel.

cause the series is found both east and west of the river.

Although much of the earlier geological arrangement in the Cordilleran system was very provisional in character, the new series of research beginning in 1894 shows a better and clearer conception of conditions, and the time is not far distant when we shall witness more correlation of the rocks north and south of the international boundary line than has prevailed heretofore.

This subject is invested with unusual interest. Dr. Dawson himself was of the opinion that rocks found in the Cambrian strata near Adams lake have their representatives in California. This statement adds very much to the interest taken in this subject by practical mining men who know the value of scientific comparisons which are based on demonstrated truths.

I shall endeavor at some future period to present a fuller and more particular review of this question for the information of the readers of the MINING AND SCIENTIFIC PRESS.

Upon the theory of dynamic metamorphism what appears to be impossible conditions may be satisfactorily explained. This seems to have advanced very close to a practical demonstration in the light of recent investigations in the Rocky mountain region.

The Commercial Assay of Lead Ores.*

Written by W. A. JOHNSTON.

In reviewing the article of Mr. Warwick on "The Commercial Assay of Lead Ores," it seems to me that it is not as thoroughly scientific as it should be, and it certainly is inaccurate and misleading. It starts out by saying the fire assay is so inaccurate that it is a wonder the sellers of ores have made no organized resistance to the fire assay, leaving us to infer that the buyers object to this method, while as a matter of fact the smelters want accurate assay methods. Many years of experience in comparing assays for settlement convince me that the smelters get no advantage by fire assay.

It is not a fact that all smelters use both the chemical and fire assay, being careful to adopt that method which gives the lowest results. Such a statement would argue that the miners were devoid of ordinary intelligence and the smelters were oblivious to all sense of decency and fairness. The smelter does not object to either method, but does object to using both methods on the same ore and settling on the one that gives the highest results.

It is not a fact that smelters are buying Breece Hill and Lillian mine ore on chemical assays and all other ores on fire assay. In some cases of ore containing bismuth the volumetric assay is used, because the miner would get more for the bismuth than for the lead, and besides, bismuth is considered undesirable in smelter mixtures and a detriment to the quality of the lead.

The article says: "It is notorious that the fire assay for lead ores becomes increasingly inaccurate as the ores become more complex and lower grade" (lower grade in lead). No. 1 sample carried 10½% by volumetric and 9½% by fire assay, a difference of 1%. No. 7 carried 20.6% by volumetric and 17.6% by fire method, a difference of 3%, or just the reverse of the above statement. The statement that complexity of ores increases the inaccuracy of the fire assay is not very satisfying—it is rather indefinite and too general. What we want to know is what are the usual ingredients in the ores that influence the fire assay? Can't an ore be complex and yet the fire assay be fairly correct? In the complex ores containing arsenic, antimony, bismuth, copper and iron, fire assay is very apt to give results above those of chemical method. His table of comparative tests of nine samples is too one-sided to be convincing. It proves nothing; merely shows that the volumetric method on these samples showed higher results than the fire test.

It is not unusual, nor a fact, that the ores which need the most consideration get the least. It is to the interest, and has been the policy, of the smelters to make prices which will keep as many mines producing as possible, and any discrimination in prices has favored the low-grade producer.

In many cases of ores carrying under 5% lead, the lead is paid for as iron.

I am not prepared to say, as a fact, that the loss of lead in a blast furnace should average up with a loss by fire assay. Every one knows the conditions of bandling ore in a furnace are quite different from that of an assay test, and that in the practical working of furnaces lead goes into fumes, into slag and into matte, and, in the latter, being subject to a second loss by roasting and resmelting; but I do know a smelter does not sell as much lead as it purchases.

Mr. Warwick gets away from the scientific side of the question entirely when he goes to talk about what the smelters pay for lead and what they sell it for. He figures the smelters' schedule for the lead contents, and leaves the story of the balance of the schedule untold.

It is the custom in Colorado to buy lead in ores at

so much a per cent, and if the smelter has a margin in the lead it is otherwise with the balance of the price.

There is no question in my mind that the smelters desire, and would advocate, the chemical method, but I am not so sure that Alexander's method is the best—I am told that it is very unreliable in ores carrying lime.

If the Society cares to investigate this subject further, I would approve of Mr. Warwick's suggestion to appoint a committee to investigate the subject.

Mining in Peru, South America.*

Written for the MINING AND SCIENTIFIC PRESS by
M. J. LIDSTONE, M. E.

The Chuquitambo gold mine, owned by the Nimrod Syndicate, Ltd., of London, is situated in the district of Junin, over 200 miles from Callao, on the Atlantic slope of the Andes and the headwaters of the Amazon. It is a mine noted in the history of Peruvian gold mining, and is supposed to have been worked by the Incas many years before the conquest of the country by Pizarro.

It is known to have produced several million dollars before the present owners obtained possession of it.

The location is ideal for mining purposes, the expense of operating being nominal, probably not exceeding \$1 a ton.

The town of La Quinua is just below the mine and 9 miles east of the Cerro de Pasco copper mine, owned by the J. B. Haggin Co. of New York City. It lies at an altitude of 11,000 feet above sea level. The chief occupation of the natives is agriculture, the soil being fertile and well adapted to the raising of good crops of potatoes, their staple food. The climate is salubrious, being similar to northern and central California.

Lime is the principal geological formation of the country.

The Chuquitambo has very large deposits of conglomerate and sedimentary ore, easily worked by tunnels and open cuts. It promises to be a large and successful property, having several separate deposits. The ore is carried to the mill by inclined gravity tramways.

A modern 40-stamp mill has recently been erected on the property by the Union Iron Works of San Francisco, Cal., which will be increased in the near future to 100 stamps. There is an abundance of water power, conveyed to the plant by a ditch and pipe line, which is utilized for running the mill. The ditch has a capacity of about 500 H. P.

The laborers are principally natives, who work for very small wages—from 40 cents to \$1 a day, gold.

Frank Merricks, the manager, has gone to London for a few months, and Ernest Lascelles is acting manager in his absence.

*See illustrations on front page.

The Cummer Dryer.

The accompanying engraving illustrates the Cummer self-contained dryer, which consists of a revolving cylinder incased in a steel casing. A mechanical stoker for burning slack bituminous coal is shown in the cut, but the furnace can be fitted for burning

The Cummer Dryer.

any kind of fuel. An elevator is shown for elevating the material to be dried by the dryer, but where sticky slimes are to be dried the Cummer bandling system is used. This system so handles the material that it is impossible for it to stick in the dryer.

The Cummer dust collector is also furnished with the self-contained dryer, and no dust is lost, which is a very important factor. The Revenue Tunnel Co., Ouray, Colo.; Silver King Mining Co., Park City, Utah; Smuggler Union Mining Co., Telluride, Colo., are all drying concentrates and slimes by the Cummer process. The manufacturers, The F. D. Cummer & Son Co. of Cleveland, Ohio, will furnish particulars.

Geology of the District West of Redding, Cal.

Written for the MINING AND SCIENTIFIC PRESS by
CHAS. J. O'BRIEN, M. E.

Four miles west of Redding, extending almost due north and south, a dike of andesite comes up through the ancient porphyry which forms the underlying country rock of the district. The overflow was quite extensive, and the trend of the dike is clearly defined throughout its course by outcrops of schist, due to the metamorphism of the country rock along the plane of contact.

Both the original country rock and the overflow, as well as the dike itself, are much altered for a considerable depth. In both cases the ferro-magnesian silicates are changed to chlorite, and, in the case of the porphyry, secondary calcite has formed. The andesite is considerably richer in iron than the porphyry which it penetrates and overlies, and both are rich in alumina and poor in magnesia, which is manifest in the schists and other alteration products of these rocks. These schists, frequently called talc, are properly chlorite, schist and phyllite, and range in color from almost colorless translucent through light and dark green to black. There is a slight difference between the schists produced in these two rocks, that in the andesite being somewhat crystalline, more blocky and opaque, than the schists in the porphyry.

Those who would anticipate the character of the ores to be found in a given formation in this district, if any, should learn to make the foregoing distinctions, as the mode of occurrence in the two formations here considered is widely different. In the first place, it may safely be said that all values occur in connection with veins in the schists. There are numbers of gash veins in the andesite, but, as far as my knowledge goes, these are invariably barren.

At the Mt. Pleasant mine, on the Shasta road, development work has been on the foot wall of the dike, the original porphyry forming the other wall. Here the quartz bodies, lenticular in form, are pretty thoroughly mineralized throughout their whole extent, the ore being pyrite, with traces of chalcopyrite and a little free gold. At the Sugar Loaf, 3 miles south of the Mt. Pleasant, development on the hanging wall of the dike has brought to light free gold in pockets, and some tellurium (nagayagite). The pyrite here found occurs in small cubes, thinly sprinkled along the interstices between quartz and schist, and may be neglected for values. This seems to be the general character of the ore wherever it has been found in the andesite.

Of what may be contained in the original porphyry little can be said in a general way. Erosion has exposed only small areas here and there, and but a few veins have been uncovered. What may be considered a promising silver prospect has been opened a short distance east of the main contact. The ore is gray copper, and assays taken from the dump show values ranging from 17 to 500 ounces of silver to the ton. Copper, lead and antimony are also constituents. The claim is not being worked at present.

The Sugar Loaf mine has two old veins in the porphyry, which intersect the contact. These ledges are large, but low grade, so far as a depth of 10 or 15 feet has demonstrated. The ore is marcasite.

An interesting feature in connection with the veins along the contact is that at times considerable lime is encountered in the gangue. It is of the variety called aragonite, which is presumed to be deposited from hot solutions. It is often found crystallized and

Hints on Rubber Belting.

Written for the MINING AND SCIENTIFIC PRESS by W. H. KRITZER.

In selecting belts, secure them of sufficient width, so they will run without slipping and still be moderately slack.

The width of belt needed depends on the tension and speed of the belt, also arc of contact on smaller pulley.

FIG. 1.

vide for stretch, cut it shorter than the actual measurement around pulleys taken with a steel tape measure drawn tight.

To allow for stretching in a new belt of 3, 4 or 5 ply, cut it $\frac{5}{32}$ inch per foot shorter, for 6, 7 or 8

FIG. 2.

of belt, so that each hole in the second row centers between the nearest two holes in the first row.

For lacing belts rawhide lace leather is better than any other kind and $\frac{1}{4}$ inch is the proper size for belts up to 3 inches in width, $\frac{3}{8}$ inch for a 3 to 12 inch width of belt and $\frac{1}{2}$ to $\frac{3}{4}$ inch for main belts from 12 inches up. The size of holes and distance between them should be as per following table:

Width of belts.	Size of hole.	Distance of first holes from ends of belt.	Distance of first hole from edge of belt.	Space between holes.
3 in.....	$\frac{3}{8}$ in.	$\frac{1}{2}$ in.	$\frac{3}{8}$ in.	$\frac{3}{4}$ in.
3 to 6 in....	$\frac{3}{16}$ in.	$\frac{3}{4}$ in.	$\frac{3}{8}$ in.	1 to $1\frac{1}{4}$ in.
6 to 12 in...	$\frac{1}{4}$ in.	1 in.	$\frac{1}{2}$ in.	$1\frac{1}{2}$ in.
12 to 18 in..	$\frac{5}{16}$ in.	$1\frac{1}{2}$ in.	1 in.	$1\frac{1}{2}$ in.

Tight belts mean additional friction on bearings and a waste of power.

Wide, heavy belts required to perform unusually severe work should be made endless.

Seam side of belts should not be run next to pulleys.

Speed of belts should not exceed 5000 feet per minute, and less than 4000 is preferable.

In adjusting a new rubber belt, in order to pro-

vide for stretch, cut it shorter than the actual measurement around pulleys taken with a steel tape measure drawn tight.

A 4-ply belt for transmitting power is equal to a single leather belt. A 6-ply is equal to a double leather belt, and the adhesion is from 40% to 80% greater under like conditions.

Cut ends of belts squarely across and punch two rows of holes in each end, the second row to be the same distance from the first as that is from the end

Lace from center hole in first row to opposite hole in second row, in such manner that the lace shall be straight and smooth on the pulley side and crossed on back of belt, as shown in the engraving.

Always run so that the point of lap on inside runs against the pulley. This protects the outside lap, which is most liable to open up when run point against the atmospheric pressure.

If a belt slips, moisten it very lightly on the pulley

side with castor or boiled linseed oil. Never allow animal and mineral oils, grease, resin or soap to come in contact with belts.

Do not use a vertical belt if you can possibly avoid it.

Allow no foreign objects to come in contact with belts, and, if the surface is peeled or rubbed off, apply the following mixture and let dry before running: Equal parts of red lead, black lead, French yellow and litharge, mix with boiled linseed oil and add enough Japan to make it dry quickly.

Always use a pulley as large as conditions permit, as a belt of many plies will go to pieces more quickly if run over a small pulley; then the power transmitted is largely dependent on the area of contact.

Wide belts should always be put on pulleys with

with the maker as to its being laced, riveted, sewed or wired—simply a matter of choice, as one style may be more preferable than another under the existing circumstances.

Regeneration of Cyanide Solutions After Zinc Precipitation.*

Written by ANDREW F. CROSSE.

A great deal has been said in past years at our meetings concerning the chemistry of the cyanide process, but I am of the opinion that the value of correct chemical investigation and conduct of the whole process has never been estimated at its full value. At present, speaking broadly, the whole process is controlled by estimating the amount of potassium cyanide in solution, and adding the amount required to bring it up to a certain required standard of strength. An excess of alkali is generally present, and the excess has never been accurately determined. It has been stated by various speakers that the cyanide process has attained to a state of perfection, and we have been informed that, in the future, we need not look to many interesting discussions in connection therewith. I am of the contrary opinion, and I am sure that there are a great many improvements possible, even in connection with our own comparatively simple treatment on the Rand. It is needless to say that the more complex ores in other parts of the country will give rise to complications which will need much research to overcome. I doubt whether any method has yet been published for the accurate determination of the "free" potassium cyanide in a working solution, containing all the impurities found there, neither am I aware of any method that will give a satisfactory determination of the protective alkali present in such solutions. I have published a method for the determination of protective alkali, but, on further investigation, I must candidly confess that I am by no means satisfied with the results obtained.

I have mentioned these facts merely to prove to you how much remains to be done in this particular field.

Many of you will consider these investigations of purely scientific interest. I do not think so, for I hold that the more we find out as to the chemical changes which take place in our solutions the more likely we are to arrive at the most economic and profitable use of the process.

Some four or five years ago it occurred to me, and I believe it may have occurred to many others, that the double cyanide of zinc and potassium, $K_2Zn(CN)_4$, could be regenerated by precipitating the zinc as a sulphide and recovering the cyanogen, combined with the zinc, in the form of an alkaline cyanide according to the equation $K_2Zn(CN)_4 + Na_2S = ZnS + 2KCN + 2NaOH$. I made a great many experiments on these lines, and found that in the cold the precipitation was incomplete. I therefore heated my cyanide solution to a temperature of approximately 65° C., and obtained practically complete precipitation.

The quantity of sodium sulphide required is determined by carefully estimating the zinc present in the solution, and if the value of the sulphide is known, all that is required is to add sufficient sulphide to precipitate 95% of the zinc.

The precipitate separates out rapidly, the coagulation of the zinc precipitate being accelerated by the addition of a little milk of lime.

The precipitate occupies but a very small proportion of the total bulk of the solution, and the clear supernatant liquid can be decanted with the greatest ease.

It has been stated that zinc sulphide is soluble in potassium cyanide. This is scientifically correct, but the amount left in solution after using the above process is so small, and so easily got rid of by atmospheric oxidation, that it has no practical value.

The complete scientific explanation of many reactions which we find on investigating cyanogen and its compounds in diluted solution, can be fully explained by the aid of the most modern theories of dissociation; our old-fashioned chemical equations are quite incapable of illustrating the reactions which take place in diluted solutions.

The continuous use of an alkaline sulphide would be open to some objection, owing to the slight but continual increase of caustic alkali, formed by the decomposition of potassium zincate (K_2ZnO_2).

$K_2ZnO_2 + Na_2S + 2H_2O = 2KOH + 2NaOH + ZnS$.

In order to prevent this I collect the precipitated sulphide in a filter press and use it to generate H_2S . The action of H_2S on the solution is as under:

The whole process has to be guided by simple chemical analysis, thereby maintaining the free caustic alkali in solution at any fixed percentage.

The process of regenerating the sulphide used also enables me to recover any small quantity of silver sulphide precipitated with the zinc. This quantity, however, would not be very large, as the regeneration of the cyanide working solution would only take place after the solution had passed through the extractor box. Sodium sulphide has no action on the auro-potassic cyanide $KAu(CN)_2$.

I am well aware that a solution of pure $K_2Zn(CN)_4$ will dissolve gold very readily, but, in my opinion, this is due solely to the cyanogen in the "KCN" molecule; the complex molecule $K_2Zn(CN)_4$, being partly dissociated in dilute solution into KCN and $Zn(CN)_2$. The latter molecule, being in a meta-ionic state, cannot have any value as a gold solvent.

I had plenty of time for making experiments when I first returned to Johannesburg during the war. Mr. Macfarlane, the general manager of the City & Suburban G. M. Co., was kind enough to supply me with plenty of solution, and also a large quantity of spitzluten concentrates. The solution contained no "free" KCN, all the cyanide being in the form of the zinc potassium salt, $K_2Zn(CN)_4$. I obtained a very satisfactory extraction with the solution, but the subsequent precipitation was most unsatisfactory; under definite conditions the extraction being 83.4%, the precipitation only 36%, which would give a total extraction of 30%.

I regenerated the solution as above, and obtained, under identical conditions, an extraction of 91.7% on a precipitation of 96.2%; total, 88.2%.

Of course, no cyanide manager would have used a solution in such a condition; he would have improved it by adding cyanide. I arrived at an even more satisfactory state of things without the addition of any cyanide. Within the last month I have confirmed my laboratory results by treating solution by the ton, pumped direct from the cyanide sumps.

The general results of my investigations in connection with working cyanide solutions has led me to believe that we can aim at obtaining a working solution of normal constitution and strength, and regulate its composition from time to time so as to obtain the best results, both as regards solution and precipitation of the gold, with a minimum expenditure of cyanide. I will not say "cyanide of potassium," as in the near future we shall probably use the cheaper and more common element, sodium, to form an alkaline cyanide.

The method used in my laboratory for the determination of zinc in working cyanide solutions is a modification of that described on page 338 of the last edition of Mohr's Volumetric Analysis.

The solutions required are:

$\frac{N}{10}$ Iodine.

$\frac{N}{10}$ Hyposulphite.

5% Sodium Sulphide.

Method: 100 c.c. working solution is heated to about 70° C. and an excess of sodium sulphide added. The preparation is allowed to settle, filtered off and well washed on the filter with hot water, the washing is continued until the wash water shows no trace of sulphide, the filter paper is then transferred to a small 150 c.c. flask.

The flask is filled with a rubber cork having two holes bored in it, through one passes a drip funnel with tap, and through the other a short piece of glass tube, terminating in a small length of rubber tubing,

a pinch cock is attached to the latter. Sufficient $\frac{N}{10}$ iodine is then run into the flask to leave an excess of not more than 5 c.c. (30—35 c.c. $\frac{N}{10}$ I. is usually sufficient).

The cork is replaced and about 100 c.c. very dilute hydrochloric acid placed in the funnel. The tap is opened and on pressing the pinch cock air escapes and the dilute acid takes its place. The taps are then closed and the whole apparatus shaken to thoroughly break up the filter paper. After a few minutes standing the contents of the flask are

titrated with $\frac{N}{10}$ thiosulphate and the excess of iodine determined.

If X = No. of c.c. $\frac{N}{10}$ Iodine taken

Y = No. of c.c. $\frac{N}{10}$ $Na_2S_2O_3$.

(X - Y) .00325 = grams zinc per cent.

The reactions are as under:

The method is rapid of execution and capable of great accuracy.

In regard to the determination of protective alkali, my assistant, G. W. Williams, and myself have spent a great deal of time in investigating various methods of the determination of protective alkali in working cyanide solution, and we intend, in the near future, to read a paper on this subject. I do not by any

Method of Clamping and Lacing a Belt.

clamps, as illustrated in accompanying engraving, by means of which they may be drawn tightly and laced properly without possibility of injury.

The engraving is from the catalogue of the New York Belting & Packing Co., New York City.

"Running on" a belt after it has been laced is liable to injure or break it. Have the face of pulleys wider than the width of belt used, especially flange pulleys. When a tightening pulley is needed it should be placed near the smaller pulley and applied to slack side of belt. Covering pulleys increases their efficiency from 30% to 50%.

If a belt is to be shifted from one pulley to another, rollers should be placed on the shipper on each side of the belt in a diagonal position, bringing the upper ends of the rollers as near together as possible to clear the belt, and diverging from each other at the lower end as far as may be.

To find length of belt needed, multiply sum of diameters of pulleys by 1.57 and add twice the distance between shaft centers; or add the diameters of the two pulleys together, divide the result by 2, and multiply the quotient by 3.1416, then add the product to twice the distance between the centers of the shafts and you have the length required. The following table shows the horse power transmitted per inch of width of belt for each 600 feet of speed per minute:

Arc of contact with pulley.	Ply.				
	4	5	6	7	8
150°91	1.09	1.27	1.45	1.64
160°94	1.12	1.31	1.50	1.69
170°97	1.16	1.35	1.55	1.74
180°	1.00	1.20	1.40	1.60	1.80

After any scarf joint is cemented, it is optional

means consider our work as final, and I am of the opinion that the matter requires further investigation. Anyhow, the paper will no doubt give rise to some discussion.

A Man Elevator.

Written for the MINING AND SCIENTIFIC PRESS by
S. I. HALLETT, E. M.

One of the most tedious things encountered in a gravity mill of any character located upon a hillside is the question of getting from one floor to another.

Fig. 1—Front Elevation Hand Hold.

Fig. 2—Plan Hand Hold.

Fig. 3—Side Elevation Hand Hold.

The incessant climbing of stairs wears one out, and it is very often the fact that the superintendent of the mill does not get around as much as he should from sheer weariness.

The accompanying engraving is of a man elevator that has been in use at the Silver Lake mill for the past year and a half, that is an immense saver of time and muscular energy.

As may be seen by the illustration, it is merely a continuous belt running at about 75 feet per minute, with hand-holds placed at convenient distances, so that a man may step upon one rest, taking hold of another, and travel up one side and down the other.

They are an extraordinary convenience in a tall mill and, in a general way, we have never had an accident with ours. Occasionally we have had a man get absent-minded and go over the top, where a platform is placed handy for just such gymnastics, but I have yet to learn of a case where the same man went over a second time. They are inexpensive but extraordinarily convenient.

DATA FOR MAN ELEVATOR. — Upper pulley, 12 inches diameter, 14 inches face flanged, $2\frac{1}{8}$ inches bore.

Lower pulley, 12 inches diameter, 14 inches face flanged, $2\frac{3}{16}$ inches bore.

Belt, 12 inches, four-ply, rubber.

Foot rests, placed 5 feet 10 inches apart, and are

Man Lift in Silver Lake Mill, Silverton, Colo.

fastened to the belt with elevator bolts.

Idler pulleys are used as guides on each floor, through which the belt passes.

Speed of belt, 75 feet per minute.

Gold in Georgia.

"Gold and pyrite deposits of the Dahlonega district," by Edwin C. Eckel, in Bulletin 213 of the U. S. Geological Survey, discusses briefly the general geology of the Dahlonega district (Lumpkin county), the gold ores and ore deposits, the relations of the gold ore deposits, and their age. The upper weathered zone of gold deposits can be worked at very low

ejected the copper and eruptives. The copper deposits lie in two sheets, each about 12 feet in thickness, one immediately on top of the limestone, the other about 40 feet above it, with an intervening sheet of eruptive rock. From these sheets, which dip at an angle of 20° from the horizon toward the northeast, there are ramifications of copper deposits and veins in the limestone, but the main deposits are the two sheets described. Besides the volcanic, there have been seismic disturbances, as shown by several well-defined faults between A and B (see sketch), and it is not therefore impossible that at one time the present isolated deposits on the Cananea, Juarez and Ellinita claims were connected.

Geology of Cananea, Mexico.

cost by hydraulic mining; the deeper gold ore requires expensive processes, and chlorination has not been found entirely satisfactory.

The most interesting development in the Dahlonega district during 1902 was the opening of a large high-grade body of pyrite near the town, the property of the Chestatee Pyrites Co., about 6 miles northeast of Dahlonega, on the south side of Chestatee river. This deposit outcrops about 2000 feet along the surface of the ground. It appears to be not less than 20 feet in thickness and has been followed down on the dip for a distance of about 150 feet. The average of the analyses shows about 44% sulphur, 40% iron, and 3% copper.

The ores in the first two claims are chiefly carbonates, and average 5% copper, 4 ounces silver and from a trace to \$1 gold per ton; the gangue is siliceous, analyses yielding from 50% to 65% silica, 5% to 10% lime, 10% to 14% iron. The Ellinita ores run higher, but are much less in quantity, at least as far as developed. Mr. Mitchell, the general manager of the Cananea mines, has since informed me that no attempt had been made to smelt these ores, since my visit to the property. Whether any further development of the ore bodies had been attempted I am not sure. The necks or pipes from which these ores were ejected are probably located in the vicinity of what at the time of my visit was called Camp

Mitchell, and is now the town of Cananea, for it is there that the larger, richer and baser deposits of copper exist. There, too, however, at that time, the ore bodies were practically undeveloped. Nevertheless, there were open cuts showing ore 10 feet thick, and assaying 10% copper.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 19, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PRECIPITATING APPARATUS—No. 728,126; P. W. McCaffrey, Denver, Colo.

In precipitating apparatus, combination of tank for holding solution, tank being provided with central partition, around extremities of which liquid is free to circulate, cylinders mounted to rotate on opposite sides of partition and partially immersed in solution, cylinders being perforated and containing scrap metal, and means for rotating cylinders in reverse directions whereby liquid is set in motion in circular current.

WATER WHEEL BUCKET—No. 728,230; G. J. Henry, Jr., San Francisco, Cal.

Water wheel bucket of character described, consisting of two cavities having cylindrical central surfaces each having unbroken front and rear wall, front and rear walls being joined to side walls and bottoms of cavities by gradually curved spreading surfaces thereby providing large curved outer corners and unbroken interior surfaces to each of bucket cavities, to form regular discharge lines for water along bucket surfaces.

HAND ROCK DRILL—No. 728,314; V. Y. Smith, Globe, Ariz.

Combination of slotted casing, drill shank having rear head within slotted portion of casing, slide bars, spring controlled sliding tooth carried by each slide bar and which for a time in rearward movement abuts drill shank head, whereby shank is retracted against spring resistance in casing, anti-friction rollers carried by teeth laterally of same, inclines arranged in rear paths of rollers, and lever and link mechanism for actuating slide bars.

PIPE STOVE FOR HEATING THE BLAST FOR BLAST FURNACES—No. 728,377; E. P. Davis, Ilkeston, England.

Pipe stove for heating blast for blast furnaces, provided with U shaped iron or steel pipes through which blast passes, pipes depending in stove from blast boxes or chambers at top of same.

CONCENTRATING APPARATUS—No. 728,331; A. Ten Winkel, Denver, Colo.

Combination with concentrating table, of mesh fabric provided with projections extending above and below same, but made fast thereto, lower projections resting on surface of table and forming support for fabric, leaving space below for fine material passing through fabric.

HYDRAULIC CLASSIFIER—No. 728,487; C. W. Merrill, Alameda, Cal.

Hydraulic classifier consisting of closed downwardly convergent receiver, centrally located supply opening at top, water chamber surrounding opening and having side supply opening and bottom slotted to form continuous channel opening into receiver near inner periphery of receiver, and source of supply connecting with opening at top of receiver.

HANGING UP OR THROWING OUT OF OPERATION THE STAMPS OF STAMP MILLS—No. 728,631; J. J. R. Smythe, Johannesburg, Transvaal, South Africa.

Means for hanging up stamps of stamp mills comprising angular plate or sector mounted on jack bar, so that it may rotate freely thereon, socket pivotally attached thereto in which supporting rod or finger is fixed and socket or hole for operating lever, and

catch pivoted to sector, arranged so that when sector is rotated on jack bar it lifts finger to elevate and retain tappet clear of cam.

ORE WASHING PAN—No. 728,677; J. A. Creasy, Kansas City, Mo.

Ore washing pan having inwardly projecting sector-shaped flanges arranged on opposite edges of pan, and riffle bar running around one side of pan from one flange to other.

MEANS FOR PRECIPITATING DISSOLVED METALS—No. 728,746; P. W. McCaffrey, Denver, Colo.

In copper precipitating apparatus, combination of tank adapted to hold solution, upwardly projecting partitions located in tank, depending partitions, located intermediate upright partitions and whose lower extremities terminate below upper extremities of upwardly projecting partitions, and perforated cylinders containing scrap iron, cylinders being mounted to rotate in tank whereby they are partially immersed in solution, cylinders being located directly above upper extremities of upwardly projecting partitions and close to extremities, tank being constructed to receive solution one end and discharge by overflow at opposite end, discharge being above lowest part of cylinders, whereby solution caused to pass through scrap iron in all cylinders before leaving tank.

METHOD OF MATTE OR PYRITIC SMELTING—No. 728,701; O. S. Garretson, Buffalo, N. Y.

Method matte or pyritic smelting consist in subjecting molten matte to converting or bessemerizing blast underneath column material which contains flux, removing slag and subjecting slag to action of blast underneath column of sulphur-bearing material.

GOLD EXTRACTION PROCESS—No. 728,397; T. B. Joseph, Salt Lake City, Utah.

Process of extracting gold and silver from ore containing same when in suitable condition, consists in subjecting ore to leaching action of solution of water, cyanide of potassium, hydrate of calcium, peroxide of barium and carbonic acid gas, gas being forced into leaching solution simultaneously with compressed air.

PROCESS OF RECOVERING BROMINE—No. 728,566; C. D. Grove, Colorado Springs, Colo.

Treatment of ore by bromine and subsequent recovery of bromine, process of reducing bromates formed in alkali solutions to bromides, consists adding to bromates hydrogen sulphide.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

It is reported a German company has acquired a group of claims on a ledge of tin-bearing ore on Cape Prince of Wales. A smelting plant is on its way to Cape York.

ARIZONA.

COCHISE COUNTY.

A strike is reported 4 miles east of Pearce on a group of claims being worked by J. C. Mortelle, W. Lane and F. Taylor. The ore is said to carry sylvanite. It is near the Commonwealth mine.

The Atlas Ex. & M. Co. has bought the C. Fanning group of fifteen claims aggregating 300 acres of copper ground adjoining the Lake Portage & Bisbee group, 3 miles from Bisbee. The Lake Portage Co. have a diamond drill at work prospecting the ground.

The Princeton M. & S. Co. at the head of Ramsey canyon, 24 miles southwest of Bisbee, has resumed, says President H. Hamburg at Bisbee. The work consists of prospecting shafts, a tunnel 200 feet long and a winze 20 feet deep at the face of the tunnel where the ore was found. Average assays show 10% copper and six ounces silver.

A strike of free milling gold ore is reported made in the Golden Era mine, which joins the Easter Sunday mine, in Warren district, near Bisbee.

The W. K. Taylor group of three claims in Warren district, near Bisbee, has been sold to T. Hogan and G. M. Staltz for \$12,000. The group is near the Golden Era.

GRAHAM COUNTY.

The mill of the Detroit C. Co., near Morenci, is handling 600 tons of ore daily, making 100 tons of concentrates, and using 125 gallons of clear water per minute, in addition to the water used over again, says the Florence Blade. The company has four furnaces in operation and are building a fifth, to have a capacity of 600 tons daily. The water supply is pumped from Eagle river.

MARICOPA COUNTY.

The Ford group of copper mines has been sold for \$45,000 to the La Gloria M. Co. of Philadelphia, Pa., men, H. A. Bomberger president. The group consists of five claims in north end of White Tank mountains, 35 miles northwest of Phoenix and southeast of the Vulture mine. It is 8 miles from Beardsley on the S. P., & P. Railroad and near the Agua Fria river. The ores carry values in copper and gold.

President G. Beebe, San Francisco, Cal., of the Cieneguita C. Co. of Phoenix, says they have drawn up plans for a 300-ton matte smelter with Bessemer converters and expect to have the plant ready for operations this fall.

MOHAVE COUNTY.

(Special Correspondence).—T. Thornton, developing his Homestake mine, near Chloride, reports opening up a ledge of gold-silver ore at a depth of 78 feet from the surface.

The Elkhart mine and mill resumed last week, after a temporary shutdown to replace some of the machinery in the mill.

Fire destroyed the shaft house at the Empire mine last week and damaged the pumping plant, which was furnishing water for the Elkhart mine and mill, 1½ mile below. Repairs are being made.

The Minnesota mine and mill are working a few men, says Manager E. T. Loy. S. Smith is developing his gold discovery on the Emerson mine.

Schemmelpennig & Dryden are developing their lease on the Altura mine and have put on more men. They are shipping ore.

Developing and prospecting continue in the new gold district 8 miles west of Chloride, around the Dempsey-O'Dea mine.

At Mineral Park ore is being taken out of the shaft of the Queen Bee, some of which assays high in silver. Hoisting machinery has been put in.

The Keystone mill is to be rebuilt and run on ore from the Keystone mine.

At Gold Road a test of the machinery of the 300-ton milling plant of the Gold Road mine was made last week and will be in full operation by June 1.

The Leland Co., near Acme, expects to have its 120-ton plant in operation next week on its own ore. At the Leland, as at the Gold Road, there is a large tonnage of ore on the dump.

Chloride, May 25.

H. L. Pickett of Salt Lake City, Utah, manager of the Savanic copper mine, south of the Utah line, says he will build a smelter at the mine and men will be put to work June 1st.

C. D. Pickering, superintendent of the

Yucca Cyanide M. & M. Co., near Kingman, says additional machinery will be put in their mill, which they expect to have in operation next month. It is the intention to concentrate the ores and ship the product to the smelter. The main shaft is down 400 feet and drifts are being driven from that point. The values are chiefly in gold.

PIMA COUNTY.

The Tucson S. & R. Co. will build a smelter on the Copper King group of mines, 14 miles southwest of Tucson, says Manager W. W. Robinson. There are twenty-four claims in the group.

The Silver Bell copper mines are reported sold last week to the Imperial C. Co. for \$1,000,000. The sale includes sixty claims and two sixty-ton-furnace plants. The mines are 40 miles west of Tucson and 20 miles south of Red Rock, on the Southern Pacific.

PINAL COUNTY.

(Special Correspondence).—The Pinal Paraffine Oil Co., near Kelvin, have their well down 1230 feet.

Kelvin, May 25.

SANTA CRUZ COUNTY.

J. T. Brickwood has bought a half interest from T. O'Mara in the Old Soldier and Young Volunteer mines in the Patagonia mountains, near Nogales, and near the Bluenose and Mowry mines.

YAVAPAI COUNTY.

(Special Correspondence).—The Rigby M. & R. Co., T. J. Rigby president and manager, and H. A. Clarke superintendent, will erect a 100-ton mill at Mayer. The process decided on is the Pohle-Crossdale. They intend to make same a custom plant for handling the ores of the district.

Mayer, May 25.

Near Congress, J. F. Holden and W. B. Akers have begun operations at the Last Chance mine of the Coronado G. M. Co. They intend to work this mine by a series of tunnels.

Development work on the Bunker Hill group at Bunker Hill, Lynx Creek district, near Prescott, is progressing. The ore body in the main shaft is 2 feet in thickness and running \$20 per ton in gold.

At the Bannie a steam hoist has been put in. On the Gold Dust mine of the Hudson group a vein of gold and copper ore, averaging \$30 per ton, is reported.

Work of building a mill and hoist to replace the one recently burned at the McCabe mine, at McCabe, will begin as soon as lumber and other material can be gotten on the ground. The shaft will be straightened, which will change the location of the mill and hoist slightly, but will add to the output. It was found the damage done by the fire to the shaft was more than at first thought.

The Jerome News says the United Verde C. Co. at Jerome propose to drive a tunnel 7000 feet from a millsite farther down the Verde river. The present tunnel is 3461 feet long. The new tunnel will cut the property at greater depth (1100 feet) and will avoid danger from fire. The United Verde smelters have been undergoing repairs.

There are 130 men at work at the Iron King mine, says the Prescott Courier. It is the intention of the American C. Co., operating the Iron King, to put in a smelter next fall. Their mill has a capacity of fifty tons daily, and the cyanide plant also has fifty tons capacity. The cyanide plant does not treat the mill product, but works a different class of ore. The crosscut on the ledge has been driven 90 feet, and is in sulphide ore.

YUMA COUNTY.

The King of Arizona mine and mill, near Yuma, have resumed after a shutdown of two weeks, during which time repairs were made in the deep wells, from which the water supply is derived.

ARKANSAS.

MARION COUNTY.

The zinc concentrating plants in Rush creek district, near Yellville, are running steadily and shipments are being made from the Buelah mine's mill and from the Morning Star mill. The shaft sunk on the Nakomis, at Dodd City, is said to have proven the correctness of the drill hole records, as it entered a run of lead at the level indicated. This company's mill will be put into operation next week. Shipments from the Almy mine in Sugar Orchard district have resumed. Additional machinery has been put in.

CALIFORNIA.

AMADOR COUNTY.

At the Zella mine, near Jackson, thirty-five stamps are dropping in the mill.

C. A. Marener is arranging to start work on the Vaughn (Champion) mine in Hunt's gulch, adjoining the Amador Queen, near Jackson.

The Superior Court last week granted a decree and judgment quieting title in

A. Hayward, Hobart Estate Co. and C. D. Lane of the mines and ditches near Plymouth owned by the Plymouth Con. G. M. Co. of New York.

The directors of the Argonaut G. M. Co. have decided to postpone the reopening of the Argonaut mine, near Jackson, until next year. The unsettled condition of the labor question is thought to be the cause for this action.

CALAVERAS COUNTY.

(Special Correspondence).—The annual report of the Gwin Mine D. Co. for the year ending March 31, 1903, shows 138,033 tons of ore mined and 138,383 tons of ore milled and concentrated, the difference being due to ore in the bins at the beginning of the year. There were 2010 83 tons of sulphurets (less moisture) produced, on which wagon and railroad freight, loading wagons and cars and smelter charges amounted to \$10.931 per ton of sulphurets, or \$0.1588 per ton of ore milled. The cost per ton of ore for mining and development was \$1.9443, for milling and concentration \$0.3060, making a total cost of production and treatment (including smelter charges) of \$2.4091 per ton of ore.

Gwin Mine, May 27.

A vein of ore running \$15 per ton is reported struck in the crosscut on the 200-foot level of the Maltman mine, near Angels, last week. Two 14-inch Cornish pumps are on the ground at the '49 mine, near Douglas Flat. Each pump weighs eight tons.

The Voinich M. Co., near Angels, are putting in hoisting machinery at the Voinich mine, and expect to resume shaft sinking by June 10.

Manager Williams says the Big Six mine, near Jenny Lind, has been incorporated and will be opened up next month.

EL DORADO COUNTY.

Men are at work on the Ford copper and asbestos mines, near Georgetown, and development work is being done on the Modoc and Van mines, all under the supervision of the El Dorado C. Co.

The Zantgraf mine, 7 miles from Auburn, Placer county, is being reopened and the plant which was destroyed by fire is being rebuilt, says A. B. Eastwood of Loomis, superintendent.

FRESNO COUNTY.

C. A. Canfield has leased ground from the Aetna Oil Co. at Coalinga and will start drilling operations next month.

McClurg & Claypool are rigging up for No. 3 well, near Coalinga. The company brought in a 200-barrel well in March and has No. 2 nearing completion. It is reported the Blue Diamond Oil Co. will resume next month, after being idle for a year.

INYO COUNTY.

A power transmission plant is being put up near Reward, from which power will be transmitted electrically 2 miles to the mill of the Reward G. M. Co., where induction motors will be used to drive a 20-stamp mill, air compressor and rock breaker.

KERN COUNTY.

The California-Sedalla Oil Co., near Bakersfield, are building another rig. The Diamond Oil Co. propose to put down ten more wells.

The Belgian and the San Francisco-McKittrick oil companies, in Kern river field, near Bakersfield, are shipping regularly. The McKittrick is producing 300 barrels a day and has 10,000 barrels in the slump holes. The Kern River Co. is erecting four additional rigs. The company is getting its water from the McKittrick Co., which supplies water to several companies from its artesian well.

At the coal mine near Garlock they have a 4-foot body of coal, says Superintendent B. E. Logan. They have put in a gasoline engine and blower.

A. Grant and I. N. Inskeep of Los Angeles have bought the Hard Cash mine, near Randsburg, and G. J. Bentley, former owner, is superintendent.

MADERA COUNTY.

The Yosemite C. Co. report work progressing at the Yosemite mine, near Daulton, on the Southern Pacific Railroad, and 2½ miles south of the Buchanan copper mine. Additional machinery is being put in. C. Van Timmons is superintendent.

MARIPOSA COUNTY.

W. Boldt and G. Helser are working the Simpson mine on Grizzly gulch, 1½ mile from Mariposa. They have cleaned out the shaft and will resume sinking.

MONO COUNTY.

J. Borland and G. Cremer have bonded the Beck placer claim near Bodie, and have put men to work taking out gravel for a mill test.

There were twenty-four mining locations recorded at Bridgeport last week. The oil fields at Mono lake are to be tested this summer.

NEVADA COUNTY.

Manager R. J. Simmons of the American Hill mine of the Sierra Nevada M. D. Co. says another shift was put to work last week, and the shaft, which is down 45 feet, will be sunk to 150 feet.

Work on a 1200-foot tunnel at Blue Tent, 4 miles northeast of Nevada City, began last week, says Superintendent C. J. Graham. It is thought the main channel will be struck at this distance.

After a shutdown due to an overflow of water caused by the heavy winter rains, the Conlin mine, near Grass Valley, has resumed operations, says the Tidings.

The La Bella mine, near Willow valley, near Nevada City, has been sold to New York men, and buildings and machinery will be installed. Grading has begun for a compressor and compressor house, says J. McGovern, of New York City, local manager for the company. The mine is worked by a tunnel, and it adjoins the Le Compton mine.

Superintendent English of the Culbertson and Syracuse mines at Graniteville reports work progressing, and an air compressor has been put in on the Culbertson property.

PLACER COUNTY.

At Dutch Flat the Golden Shaft Drift Co. has organized to develop the gravel deposits under the town of Dutch Flat and adjacent thereto, to a height not exceeding 9 feet from the bedrock, says the Colfax Sentinel. E. Malloes, J. L. Gould, A. A. Ferguson, J. M. Barney and R. Munroe are directors.

L. J. Littlefield has a bond on the Steep Hollow gravel mine, near Dutch Flat, says the Placer Herald.

PLUMAS COUNTY.

A. A. Sturges of Buffalo, N. Y., of the Sequin M. Co., says work will be resumed on their group on Rush creek, near Crescent Mills.

SAN BERNARDINO COUNTY.

The Bagdad Development Co. has been organized by C. K. McCormick of Salt Lake City, Utah, O. P. Posey and W. Bayly of Los Angeles, to work two groups of copper and gold claims at Bagdad. The company will prospect its territory with diamond drill.

A strike has been made 8 miles south of Amboy station by M. Plueff of Daggett, P. King and S. Alf of Ludlow. They have located eight claims. The ore body is exposed by three cross canyons; it is free-milling, averaging \$10 per ton.

SANTA BARBARA COUNTY.

At San Luis Obispo, last week, the Mulholland Oil Co. was incorporated, to operate on the Guadalupe rancho, a few miles southeast of Guadalupe lake. The directors are A. H. McKay, W. Mulholland, H. E. and J. A. Graves and W. R. Howland. The principal place of business is Los Angeles.

SHASTA COUNTY.

Kimberly & Co. of Salt Lake City, Utah, having an option on the Balaklala copper mines, near Kennett, have incorporated the Balaklala C. Co.; P. L. Kimberly, C. A. Malm, W. F. Snyder, C. D. Porter and S. Wiel, directors. It is intended to erect a smelter of 1000 tons daily capacity. W. F. Snyder of Salt Lake City is manager.

SISKIYOU COUNTY.

The second payment on the Snoozer mine on Russian creek, near Yreka, was made last week by the Zarina M. Co. of Chicago, Ill. They have men at work sinking a shaft on the ledge and expect to put in additional machinery.

It is reported the Hoboken mine, near Yreka, owned by Diggle's estate, will be reopened. It is on the south side of Cherry creek from the Cherry Hill, Drummer Boy and Mount Vernon mines.

W. H. Young of San Francisco has a bond on the Swain-Newson-Clever mine of White's gulch, near Etna, and has men running a developing tunnel on a porphyry dike.

J. M. Dobbins of Edgewood has started up the Puritan mine, near Edgewood.

TUOLUMNE COUNTY.

G. F. Beveridge of San Francisco has bonded the Blue Eagle quartz lode claim, in Jawbone district, near Groveland, together with water rights.

J. Phillips of Groveland, owning the Phillips, Antioch and Half Breed group of claims, will put up a 10-stamp mill on the mines.

J. A. McMahon has bought a third interest in the Silent Friend quartz claim, on the Tuolumne river, 4 miles from Groveland.

G. E. Reeb and E. I. Preston of San Francisco are reported to have bought the Haggin-Hearst interests in the Scorpion gravel mine, the Greelan Bend gravel mine (130 acres) and the Cook gravel mine near Columbia. The latter parties have since sold the Cook gravel mine to M. J. Wolfing.

Operations at the Sierra mine, near

Groveland, were resumed last week and sinking in the main shaft is in progress.

W. McCarthy has taken a bond on the Newsom mine, east of Groveland.

The Marguerite and Marian mines, near Yankee Hill, near Sonora, are showing a 4-foot vein of blue ribbon rock. The tunnel on the Marian is being run to tap the shaft.

The Big Creek M. Co. is developing several claims of a group of fifteen, 5 miles above Groveland, says Manager E. H. Wiley.

Lumber and other supplies are on the ground for the Don Pedro G. M. Co., south of Chinese, and development work has begun, says Manager W. H. McClintock of San Francisco.

Work was resumed in the Clif mine at Jacksonville last week, and A. P. Chittenden is superintendent.

Sinking continues in No. 1 shaft on the Harvard mine, near Jamestown, and is down 790 feet.

D. R. Oliver of San Francisco has bought the interests of Johnson & Fraser in the Mazeppa mine 1 mile south of Stent, and Superintendent J. L. Bryson has begun operations.

At the Doyle gravel mine, near Columbia, washing is in progress. An old shaft 500 feet from the working shaft has been cleaned out and pay gravel found at the bottom. Washing is also under way at the Woodside mine.

An ore shoot carrying good values is reported uncovered in the Bell mine, near Tuttle town.

TRINITY COUNTY.

The Chloride Co. is running thirty stamps on ore from the Chloride-Bailey group and the Jenny Lind, near Dedrick. From the former the ore is conveyed to the mill by an aerial tramway. From the Jenny Lind the ore is taken to the bins, 1000 feet by a double-track tramway, and then to the mill by a mule tramway, 1 1/2 mile long.—On the Ralston mine G. L. Bailey is taking out ore and doing development work. He has struck the ledge on the lower level. The mine is equipped with a 2-stamp mill.

At the Globe mine, near Dedrick, Superintendent Skinner has men at work and the air compressor is being put in place on Bear gulch. Connections are being made with the mine and mill. The mill will be run by compressed air instead of steam as formerly.

YUBA COUNTY.

Manager C. L. Crane of Camptonville says he has the machinery on the ground for a dredger to operate on the Middle Yuba river. Crane is also interested in the Honeycomb quartz mine near Camptonville.

COLORADO.

CHAFFEE COUNTY.

The Ohio & Colorado S. & R. Co. at Salida are increasing the capacity of their plant.

GILPIN COUNTY.

(Special Correspondence).—The Gower M. & E. Co., operating the Pierce mine on Winnebago hill, near Central City, has their new shaft down 200 feet. The first shipment made from this shaft netted \$109 per ton. They recently made a good strike in the first level. E. M. Messiter is superintendent. The Butler G. M. Co. is developing the Butler and Reno claims on Academy hill. They have a shaft down 350 feet. G. W. Mabey is manager.

Central City, May 25.

The Blue Grass M. Co. has put on another shift to handle the increased flow of water at their Lone Star mine, in Phoenix district, near Rollinsville, says Superintendent Alexander. They are crosscutting south on the west side at a depth of 150 feet, and also driving east. Iowa parties are interested.

At the Pierce mine at Central City the shaft will be put down another 100 feet, a total depth of 300 feet. Lead ore is being taken out of the 124-foot west level.

The Kansas-Burroughs Con. M. Co. has taken a lease on the Ophir-Burroughs mine on Quartz hill, near Central City, and will work it in conjunction with its other group of mines in that section. The machinery has been overhauled and the Gilpin Tramway Co. will lay a branch track there.

The Register-Call says the Celura M. & M. Co. has incorporated at Central City—H. M. Young, C. W. Adams, C. C. Thurman—to operate in Gilpin, Clear Creek and Boulder counties.

The Russell-Gilpin M. Co. has incorporated at Central City—J. & J. W. Best, F. N. Bancroft—to operate in Gilpin county.

The Mutual Benefit G. M. Co. resumed last week on its Pleasant View mines, on Gunnell hill, near Central City, and E. A. Reser of New York City is manager. The property has been idle for a number of years, so that retimbering was necessary. Work is being carried on in the 400-foot level, where they have opened up a body

of milling and smelting ore. The company has put in a plant of machinery and expects to begin shipments next month. The same company owns the Mldas tunnel and the Dallas group on North Clear creek, and they propose as soon as the Pleasant View is well under way to resume at these also.

B. G. Granville and J. L. Hocfler of Denver are putting up a concentrating plant on North Clear creek, near Black Hawk, and it is expected to have it in operation by July 15.

Sinking operations are under way at the Baldwin mine, below Russell Gulch, by the Wilkesbarre M. Co., and will go 100 feet deeper, says Superintendent Harrington.

Work began last week on the German and Phoenix mines, in Phoenix district, near Rollinsville, by T. K. Brooks, says the Register-Call.

G. D. Kaye, with Canyon City, Colo., and Cadillac, Mich., men, has bought the Stanley mill, east of Gilpin, and they have incorporated the Cadillac M. & M. Co. to operate the Friend and Myres groups. The Friend group is in Lump gulch, while the Myres group is north of Gilpin. Work was begun last week in sinking at both groups. The Stanley mill has five rapid-drop stamps and is amalgamating and concentrating.

Stevens & Co. expect to resume at their Victoria mine by June 1 and their shaft, down 150 feet, will be sunk deeper. They have smelting and concentrating ores.

The Rhoderick Dhu G. M. Co. are doing preliminary work at the Rhoderick Dhu and Protection mines on Quartz hill, near Central City, says Manager J. C. Fleischhut. They have started work on the Protection shaft, which will be the main working shaft of the group, and it has been retimbered. The gallows frame is being built and a double friction hoist and 35 H. P. boiler will be set up.

JEFFERSON COUNTY.

In addition to blowing in next week, at the Golden Smelting works at Golden, work will also begin on a refining plant of sufficient capacity to handle all the matter produced by the furnaces, says H. Berry, principal owner.

LAKE COUNTY.

Manager Dewey of the Bug G. M. Co., near Leadville, says additional machinery is on the ground and operations will be resumed June 1. The shaft will be sunk another 400 feet, which will give the company a 600-foot shaft, the diamond drill having proven up ore at that point.

A strike was made last week in the Caribou mine on Carbonate hill, at Leadville, of a 5-foot vein of chloride ore carrying 30% lead and eighty ounces of silver. J. F. Campion is interested.

The Matchless mine, near Leadville, will be reopened next week, says J. O. Callenette of Denver, who has a lease on it. There are three shafts on the Matchless and two of them are being worked by lessees, the main shaft, however, having been idle for several years.

The Fryer Hill M. Co. of Denver, operating on Fryer Hill, at Leadville, propose to build a smelter in Leadville to handle their own ore. The ore in the Fryer Hill mine is found mostly as iron oxide, sulphide and dry siliceous ore. This grade of ore is most easily and cheaply treated with a pyritic furnace. The company is doing development work through four shafts and are sinking two more. When these are finished shipping will be begun, and, with the ore in sight, they expect to take out 1000 tons a day. A. M. Gaines is president.

No. 4 shaft of the Ibez at Leadville is being sunk at the rate of 3 feet per day, and by July 1 it is expected the 200 feet will be sunk and connections made with the Yak tunnel. This will benefit both companies, especially the tunnel, as it will give ventilation and do away with the expense of driving compressed air to the heading, a distance of 2 miles. When the connection is made it is expected the tunnel will be driven further into Breece hill.

LARIMER COUNTY.

It is reported a vein 15 inches wide, carrying bornite and copper glance, has been opened at the bottom of the workings in the Bonbright group, near the Coldwater mine, 3 miles from Pearl.

SAN JUAN COUNTY.

G. C. Boss of Silverton says the Corn-cob and Liverpool claims, Red Mountain district, have been sold to Manager F. P. Tanner of the Hammond Tunnel Co. for \$8000. The Boss half interest in the Cloudy Day is bonded to the same company for \$5000. These claims are on the line of the Hammond tunnel. The Hammond tunnel is in 5000 feet and was started to cut the Tom Boy vein from the Red Mountain side.

The Eureka Exploration Co. have their tunnel on the Cascade vein to crosscut the Ridgeway vein at a depth of 1000 feet, driven in 300 feet from Maggie gulch, near

Eureka. The ore of the Cascade vein is a sulphide and carries values in gold and silver. Work will be resumed in the upper workings of the Ridgeway and shipping ore mined.

SAN MIGUEL COUNTY.

Manager E. L. Davis says the Mayflower G. M. Co. has been organized to operate the Mayflower group of gold lodes in Bridal Veil basin, near Telluride. He has begun development work. They will sink a shaft on the main vein to depth of 1000 feet, and open stoping ground in both directions from the shaft.

The management of the Liberty Bell G. M. Co. propose to build an addition to their mill, 1/2 mile above Telluride, which will include the enlargement of the present cyanide plant and the addition of machinery at an estimated cost of \$100,000, \$60,000 of which will be for machinery. This mill is treating 300 tons of mineral daily, which is yielding satisfactory values, two-thirds gold and one-third silver. The company has 250 men on its payroll.

The Alta mines, in Turkey Creek basin, near Ophir, are making regular shipments of ore and concentrates. The mill is turning out an average of two carloads, ten tons each, of concentrates per day. Some high-grade ore is shipped crude to smelters, and altogether the shipments, on the present basis, will amount to 100 carloads per month. The shipments are made from Ophir station, though the offices and headquarters of the company are at Telluride. N. T. Mansfield is manager.

F. T. Axtell, manager of the Caribean and Montezuma mines at Ophir, while maintaining the usual output of forty-five tons a day for the concentrating plant, has additional men doing dead work and getting the mine in condition for an increased production. The owners are in litigation with the Suffolk-Globe M. & M. Co. over the placer on which the mill is located, and as soon as it is adjudicated a larger milling plant will be built.

SUMMIT COUNTY.

In the Ten-Mile district, near Breckenridge, a strike of galena is reported by Ryan & Allen, who own a group of lode claims on the southwest extension of the Wheel of Fortune group. Assays show forty ounces silver, \$15 gold and 30% lead.

TELLER COUNTY.

A strike was made last week in the main working shaft of the Burns of the Aescia Co. at Cripple Creek, being made in the second level and south of the shaft, near the Pharmacist line. Johnson & Smith found ore showing sylvanite and free gold, says the Times. They are working under a sub-lease from Udick & Devine.

Sinking is in progress by the South Burns Leasing Co., operating on the south end of the Burns claim of the Aescia Co., Cripple Creek. They are down 165 feet and will cut a station and drive for the vein. They are washing the dump made from the ore that was hoisted from the first level.

The Jack Martin Leasing Co. has a two years' lease on the middle block of the Morning Glory No. 4 of the Work Co., Cripple Creek, from the surface down to the Ophelia tunnel level, which is 435 feet in depth. It is intended to explore for the Howard vein of the Mary McKinney.

The August Flower Leasing Co., operating the Katinka Co.'s ground on Guyot hill, near Cripple Creek, have set up the boilers and the compressor is being put in. It is expected that sinking will be resumed next week and will continue to a depth of 700 feet. The company is shipping 350 tons of smelting ore per month.

Operations were resumed last week on the Hawkeye mine at the head of Barnard creek, near Cripple Creek, and sinking is in progress. Machinery has been put in.

The Stratton mill and the dump at Gillett has been leased to F. J. Butters & Co., who intend cyaniding the dump.

Operations have been started on the Great Western mine, near Gillett. A plant of machinery has been put in.

Manager C. S. Keifer says he will start up operations on the group of the Nickel Plate Co. that owns thirty acres of ground between Copper and Rhyolite mountains, near Cripple Creek. There are two shafts—one is down 150 feet, while the main working shaft is 465 feet in depth. Besides the work to be started on copper mountain the company intends resuming on their Squaw mountain group, the King Solomon, which adjoins the Little Puck. The upper portion of the ground has been leased for a period of two years yet to run. With this company at work there will be three steam plants in operation on Copper mountain.

The lease of Smith & Altman on the Elizabeth Cooper of the Doctor-Jack Pot Con. Co. at Cripple Creek has been amended so as to permit of mining to a depth of 700 feet. Work was previously limited to the bottom level of the Smith & Riley shaft, 450 feet in depth, and from these workings the lessees are making a

steady output and are employing twenty-five miners. They will work the additional block of ground through the 700-foot level of the Morning Glory shaft.—Taylor & Co., leasing on the Buckeye of the Old Gold Co., have begun building an ore house and will make other surface improvements at the mine.

IDAHO.

BOISE COUNTY.

The Twin Sisters mine at Centerville has taken on more men and will have a mill in operation this summer.

The Twin Sisters Co. are stoping ore from the 200-foot to the 100-foot level in their Golden Star mine, near Idaho City, says Manager Ingle.

CANYON COUNTY.

D. T. Miller, S. Adams and G. Marshall of Boise, and J. H. Dodds, J. Kiroff, J. S. Barnett and T. J. Duddleson of Pocatello, have organized a company and will prospect for coal on Payette river, above Horseshoe Bend. A shaft will be sunk, first, to determine the value of the deposit which shows a 6-foot vein on the bank of the river. The field is on the line of the Dewey extension, which has been surveyed, and is 16 miles from Payette. Other Boise men have located coal lands in the surrounding hills where croppings of coal show on the surface, and a number are operating with diamond drills.

CUSTER COUNTY.

A strike is reported made in the White Knob mine at Mackay last week, showing an 8-foot body of ore in a prospecting drift being driven north from the main level. Assays show 5% copper and \$1 gold and silver. P. L. Fearn of Boise is consulting engineer.

LEMHI COUNTY.

D. Kane of Salmon City reports development work progressing in the coal mines which have been opened up near Salmon. A good product is being turned out and is marketed at \$5 per ton.

SHOSHONE COUNTY.

Wallace advises say the bringing of electric power into that district by the Washington Water Power Co. of Spokane, Wash., will materially reduce working costs in the mining industry of the Cœur d'Alenes. Power will be sold to the mines at \$50 per horse power per year. The mine owners say that with steam it now costs them \$110 to furnish 1 H. P. per year. There are four companies in the deal, although other companies will take power—the Standard, the Hecla, the Mammoth and the Empire State-Idaho companies. The last named operates the Last Chance mine at Warden and the Tiger-Poorman at Burke. These companies have contracted for 1500 H. P. per year for five years at the rate of \$50 per horse power per year. The Mammoth will use electricity to run its compressor, light the mine and operate its motor cars. The Standard will use it for its two compressors, pumps, lighting and motor cars. Additional machinery is being put in for electric pumps. At present they will not use electric power to operate the drills. The other companies which will use electric power are the Bunker Hill & Sullivan, Crown Point, Morning, Frisco and Hunter. Transformer stations are being built.

The Oreano M. Co., operating a group of claims northeast of the Standard, near Wallace, is pushing development. The crosscut tunnel is in 250 feet, and they expect to cut the first lead at 300 feet. There are two leads and it will take a 1600-foot crosscut to explore both.

In Pine Creek district, near Warden, fifteen men are at work on the Highland Chief mine. The mine is owned by H. T. Gilbert, C. S. Lamb and J. B. Pipes.—At the Constitution men are crosscutting the vein and have shown up 14 feet of ore.—E. Booth and I. L. Melton are developing the "V" group of claims.

WASHINGTON COUNTY.

Manager E. L. Hollingshead of Weiser says the Weyant M. Co. has been organized at Toledo, Ohio, to take over the Alliance gold and copper mine on Rapid river, near Weiser, reports the Signal. The price is given as \$40,000. The company propose to build a milling plant after development work is under way.

C. F. Macey, superintendent of the Iron Springs M. Co., in Rapid River district, near Weiser, says a hoisting plant is being put up. A three-compartment shaft will be sunk on the vein and levels run. Miners are at work in the tunnel, which has been driven in 340 feet, and is on the ledge, from which ore is being taken and piled on the dump. The tunnel cuts the ore body at a depth of 250 feet from the surface.

KANSAS.

WYANDOTTE COUNTY.

Twenty acres of land adjoining the present site of the United Zinc & Chemical Co.'s Argentine plant, near Kansas City,

have been bought and the company will start work on an increase of their plant.

ALLEN COUNTY.

At Iola, work is under way on an additional block of zinc furnaces, the fourth, at the Standard Acid Co. plant.

MICHIGAN.

HOUGHTON COUNTY.

Houghton advices say nothing will be done at present to prepare for an addition to the Trimountain stamp mill at Edgemere Junction. A rock supply of 2000 tons daily is to be maintained and development work increased on the north end of the mine at Trimountain. No. 4 shaft is down 370 feet, and the second level drift north is being driven in the direction of the proposed No. 5. No. 1 shaft is sinking to the eleventh level at depth of 1170 feet. No. 2 is sinking to the tenth level and No. 3 to the ninth.

No. 3 shaft at the Wolverine, near Kearsarge, is sinking from the twenty-fourth to the twenty-fifth level and No. 4 from the twentieth to the twenty-first. Twenty-five drills are in operation in the mine and twenty-three are getting out rock for the stamps. An additional boiler capacity of 200 H. P. will be put in at No. 4 shaft, making three there.

The plant of the Lake Superior Concentrating Co. on the Franklin sands, near Hancock, has resumed for the season with improved equipment and increased capacity. A new pumping plant has been put in and the belt conveyor replaces the centrifugal pump in elevating slimes for treatment by the tables after passing through the jigs.

The two months' practical test of the inclined mortar grate designed by Superintendent Key for use at the Adventure mill has shown its economy, says Key. The head thus fitted has maintained a record of 535 tons in twenty-four hours, against 487 tons, the best previous record by the Adventure on a vertical cylindrical grate.

At the Wolverine, near Calumet, the crosscut from No. 3 shaft has opened up the West Kearsarge lode. The vein is 6 feet in width.

The working shaft of the Franklin Junior mine, near Hancock, is sinking from the sixteenth to the seventeenth level and stopping rock has been shown, especially below the fifteenth level in the southern part of the mine. No start has yet been made on the second shaft marked off last fall.

At the Winona mine at Winona they are raising from the third to the fourth level at No. 3 shaft. Work is also being carried on from the surface of this shaft. The management is said to be contemplating putting in a small stamp mill for the mine.

President Todd of the Quincy M. Co. says the underground electrical tramming equipment will be completed and in operation July 1.

The removal of the Champion's stock pile, estimated at 80,000 tons, was commenced last week, says the Financial News. Present shipments consist of a few cars daily, but the volume will be increased when the fourth stamp enters upon its career. The Champion lode was discovered four years ago, and it is estimated that the openings since made will supply the present mill capacity of 2000 tons daily.

KEWEENAW COUNTY.

It is expected the Mohawk, near Allouez, will be hoisting from four shafts and stamping with three heads before the end of the season. This will be the result of equipping No. 4 shaft with a steel rock house and a double conical drum hoist, capable of hoisting from a depth of 4000 feet, and the erecting of a third head at the mill. The deepest openings of the mine are in No. 1 shaft. Sinking is now under way at shafts Nos. 2 and 4. Twenty-nine drills are in operation in the mine. The hoist at No. 2 will be permanent and four-ton skips will be put on as soon as it is installed.

The Cliff mine, near Phoenix, is to be dismantled. The property has been idle for a number of years.

A start has been made on the Allouez shaft for the Kearsarge lode, near Allouez, says Superintendent Chynoweth. The shaft will go down at an angle of 80°, 1000 feet before striking the lode.

Near Allouez, the Rhode Island copper values are reported improving. It is thought the new shaft is not on the Pewabic lode, as at first supposed, but on the East lode, a branch of the Pewabic. The crosscut to the west and the bottom of shaft on the 1000-foot level cut what is supposed to be the Pewabic lode at 85 feet from the shaft. One machine is stopping there and is yielding good rock. The results on the Allouez conglomerate opened to the east on this level are not encouraging.

MISSOURI.

FRANKLIN COUNTY.

The Missouri Copper Mountain M. Co. are developing a group of mines near Sullivan which show a body of copper sulphurets and carbonates. A concentrating plant is being built. The ore is said to average 10% in copper. It is expected the mill and furnace will be ready for operation by Aug. 15th.

MADISON COUNTY.

The annual report of the Catherine Lead Co., operating a group of lead mines near Fredericktown, says the directors propose to build a lead smelter which will enable them to save their nickel and cobalt values. All the labor troubles which this company encountered during the past winter have been overcome and the mines and mills are again working at their full capacity, says the Lead & Zinc News.

MILLER COUNTY.

New York men are reported to have bought the properties of the Gageville M. Co., near Tusculumbia, for \$40,000. This deal includes the Gageville lead mine, owned largely by Jefferson City men. Other lands will bring the aggregate holdings of the company up to 1800 acres, including the Buster mine.

SAINT FRANCOIS COUNTY.

Plans are being prepared by the St. Joseph Lead Co. for a concentrating plant to be built at its Hoffman shaft, near Bonne Terre, and it is expected to be in operation in the fall. The mill will have a capacity of 250 tons per day. This company's smelting plant at Herculaneum (Jefferson county) is being enlarged.

MONTANA.

BEAVERHEAD COUNTY.

At the Ajax mine, near Dillon, Superintendent W. B. Stanchfield says an ore body 4 feet wide has been struck on the hanging wall while driving the upraise from tunnel No. 2 to tunnel No. 1. It is proposed to increase the milling capacity this summer.

CASCADE COUNTY.

The Gerber mine at Sand Coulee will increase its production of coal. The management has built a boiler house at the entrance of the mine and is putting in four 90 H. P. boilers, one 250 H. P. engine, one 12 H. P. engine, one 24-inch compressor, six machine drills, six coal cutters and two pumps. With the new machinery they expect to get out 700 tons of coal a day.

CUSTER COUNTY.

Kircher's coal mine, near Miles City, is being entered from a new quarter since the settling in of the old workings recently. It was found that the roof was becoming unsafe and the tracks and other equipment were being taken out and the ground allowed to cave in. Work on the shaft has begun and the mining of coal will be resumed next month.

FLATHEAD COUNTY.

J. Riley, part owner of the Way-Up mine, near Libby, says a fan run by water wheel has been put in to ventilate the workings. There is 450 feet of piping. A tunnel is being driven, O. C. Thomason superintendent. The Way-Up is on Goat mountain, between the headwaters of Libby creek and the West Fisher, and is being developed by a series of tunnels run on the vein, which carries values in gold, with sulphides.

GALLATIN COUNTY.

Superintendent C. Rabe of the Bozeman Corundum Co. reports that he has sunk the new shaft, known as the Cabin shaft, to a depth of 75 feet, and found the vein there wider than hitherto developed. Also a better quality of crystals was exposed.

JEFFERSON COUNTY.

Work will be resumed on the Buckeye mine, in Jack Creek district, 12 miles north of Basin, as soon as the snow clears enough to allow the opening up of travel. The owners have contracted with L. Sponheim and A. Freeburg to develop the mine.

The Boston & Seattle M. Co. has a lease and bond on the Peerless Jennie mine, near the Josephine mine, in Jack creek, near Basin. It is stated the company will work the dumps and put in machinery to develop the mine. This company controls the Ontario group and has let a contract for a smelter to be built at the mouth of the Cataract tunnel, says General Manager Lott of Helena.

The High Ore mine, in High Ore district, 5 miles east of Basin, has been started up by Eastern men. Two shifts of machine men are driving the tunnel into the mountain to crosscut the lead which outcrops on the surface. The tunnel is in 1800 feet and the lead will be cut at depth of 850 feet.

The Buckeye mine, in Jack Creek dis-

trict, near Basin, and 3 miles northwest of the Bullion mine, will be developed by Sponheim & Freeburg.

LEWIS AND CLARKE COUNTY.

It is reported that men have been put to work by the Montana M. Co. at the South Drum Lummom and the Cruse Mountain Con. Co.'s groups, near Marysville.

D. L. Wing of Chicago, Ill., owning the Winslow-Burns placers in Emigrant gulch, near Marysville, is working ten men.

MADISON COUNTY.

(Special Correspondence).—The Garnet G. M. Co., operating near Pony, are driving their No. 3 tunnel, started near their mill last winter. A power plant for an electric machine drill is being built, and as soon as completed it is expected to let a contract for driving 1250 feet of crosscut, says Superintendent E. L. Ballou. Pony, May 25.

H. Kelly has a two years' lease and bond on the Dennis Hurley placer, in California gulch, near Virginia City, for \$2500. He has men at work opening up the ground.

J. T. Conner of Helena, superintendent of the Granite Mountain mines at Summit, says the company let a contract to J. Devlin and F. Walker to sink a shaft on the Apex claim 200 feet, after which it is expected the Granite Mountain Co. will put up a hoisting plant.

The Standard mine, in Pony gulch, ½ mile above Sterling, owned by J. Pollard, J. Northey and S. Lintecum, made a shipment of ten tons of ore last week to the smelter which returned \$200 gold per ton. The mine is being developed through a tunnel which has opened up a 6-inch shoot of shipping ore and 4 feet of a lower grade free milling ore. There is a shaft 50 feet deep, with ore in the bottom.

At Rochester E. M. Hand, superintendent of the Watseca mine, reports operations in full blast and the mill running steadily. The mine is worked through a vertical shaft. Mr. Hand is also interested in the Watseca Extension, adjoining.

The Rochester G. M. Co. has sunk a shaft 200 feet on its group, near Rochester, and in two drifts has struck ore showing values in gold.

PARK COUNTY.

President R. D. McNulty of the Milwaukee-Montana Natural Bridge G. & C. M. Co. reports work progressing on their group of ten claims in Natural Bridge district, near Livingston. They have a stamp mill and tramway.

J. W. McGann and C. W. Shultz have located the Standard No. 6 quartz lode claim in Sheepeater district.

T. & H. F. Hardon, with J. P. & C. M. Allen, have located the Broadwater placer claim in New World district.

SILVER BOW COUNTY.

The High Ore mine, 5 miles from Butte, has been bonded to Eastern men, says the Butte Inter-Mountain. Men are at work driving the main tunnel through the lead.

NEVADA.

ELKO COUNTY.

T. Conners, M. Arnold and G. Hubbard report opening a 4-foot ledge of lead ore in their mine at the south end of Ruby range, near Elko. Teams will begin hauling ore to Elko next week, from which point it will be sent to a smelter.

LINCOLN COUNTY.

The Quartette M. Co. at Searchlight has posted notices to the effect that on and after June 1 all employees not affected by the eight-hour law will be required to work nine hours.

NYE COUNTY.

At the Rescue mine, near Tonopah, the machinery is in and sinking and hoisting begun in the shaft, which will be continued to depth of 500 feet. — A hoist is being set up at the United Tonopah mine and the shaft will be sunk to depth of 600 feet.

The Tonopah-Gold Mountain M. Co. are breaking shipping ore from the Monte Cristo claim, that is being sacked at Gold Mountain, near Tonopah.

A steam hoist is being set up on the Tonopah-Fraction Extension, near Tonopah, says C. E. White. The shaft is down 245 feet.

Superintendent J. J. Moss says the Tonopah-Albemarle G. M. Co. has been incorporated at Campbell, N. Y. They own twelve claims, which adjoin the Mizpah Extension and the Butte-Tonopah at Tonopah; J. Troy, H. Weber, W. L. Hamilton, F. F. Richmond, B. Glidden are directors. A two-compartment shaft is being sunk.

The litigation which has been pending for the past three months between the Esperanza M. Co. and the Lone Mountain Horn Silver M. Co., involving an alleged overlapping of claims on Lone mountain, near Tonopah, has been settled out of court, says President J. M. Healy of the

Horn Silver. Z. Kendall is manager of the Esperanza. Work has resumed on both properties.

At the Colehan mine, near Tonopah, work has been temporarily suspended at the 200-foot point, pending the arrival of the hoisting plant.

STOREY COUNTY.

Drill hole No. 3 on the Brunswick lode at Virginia City is down 290 feet, and the bottom is in clay and porphyry, says Manager Ryan.

Superintendent Kyle of the Silver Hill mine, near Virginia City, shipped a bar of bullion valued at \$4001.59 to the company's office in San Francisco last week. The bar represents returns from 250 tons of ore.

WASHOE COUNTY.

F. Crowell of San Bernardino, Cal., reports finding free-milling gold ore near Lone Butte, 100 miles north of Reno. The region of the strike is in a somewhat inaccessible cattle country, which years ago contained a number of placer diggings.

F. E. Miller of Westfall, Mass., manager of the Springfield-Nevada M. Co., at Olinghouse, near Wadsworth, says both mills are in operation. The Kinkadee mill will be put in order this week at the lower mill, which will be known as mill No. 1, and the Slip as mill No. 2. This will increase the capacity of mill No. 1 by six tons per day.

On Cabin No. 2 mine work in the lower tunnel consists of an upraise to carry a stope of 120 feet to the surface. They are timbering with square sets with chutes placed every 30 feet, so as to load ore in car direct from stope. — Work at Slip and Renegade continues on the tunnel, which is in 770 feet.

Superintendent J. H. Sheehan says he is cleaning out the lower tunnel on the Crown Point mine at Olinghouse, near Wadsworth, preparatory to further development.

NEW HAMPSHIRE.

GRAFTON COUNTY.

A strike of gold-bearing ore is reported from Lyman on ground owned by E. H. Mason in north part of town. Free gold is shown.

NEW MEXICO.

BERNALILLO COUNTY.

R. L. Baca of Santa Fe has located nine claims in the Sandia mountains, 7 miles east of Bernalillo, on which he reports finding copper ore. It is claimed there are evidences of shafting and other workings and that these mines were worked formerly by the Spaniards.

GRANT COUNTY.

El Paso, Tex., advices say on and after June 1, 1903, the underground men and carmen at Santa Rita will receive an advance of 50 cents per day in wages, and that the arrangement will hold good as long as copper maintains its present price.

LINCOLN COUNTY.

Reports from Estes City state that the Sunflower M. Co., D. Sanders manager, is considering the erection of a plant to treat the copper ores of the Sunflower mine, near Estes.

SIERRA COUNTY.

The South Percha G. M. Co., A. J. Hirsch manager, report work progressing on the Great Eastern mine at Hillsboro. Two veins are being opened up.

Near Hillsboro, the Wicks mine of the Las Animas G.-C. M. Co. will have a mill of fifty tons daily capacity, says W. W. Williams of Hillsboro, manager. — The Black Peak G.-C. M. Co. has organized to operate the Black Peak and Washington groups of mines near the Wicks mine, and W. W. Williams is manager, says the El Paso, Texas, Herald.

TAOS COUNTY.

The concentrator at Twining is treating seventy-five tons of ore daily. O. W. Alexander of Cerrillos is superintendent of the smelter. — The Mamie Garro M. Co. will put in a mill. — Reports say the San Cristoval M. Co. propose to build a cyanide plant.

OREGON.

BAKER COUNTY.

The Virtue mine, near Baker City, Manager A. Buckbee, is only milling a small quantity of selected ore from the prospect shaft of the Pittsburg & Chicago claims of the main group. A main three-compartment shaft is being sunk and will go to 1500 feet.

The White Swan mine, near Baker City, owned by the White Swan M. Co., has the lower levels unwatered and is hoisting good ore from the fourth level and milling twenty tons per day in the 10-stamp mill, says Superintendent W. O. Reynolds. He has uncovered a shoot of milling ore on the third level and is sinking the shaft below the 400-foot point, but is hampered by a heavy flow of water.

The Conner Creek 30-stamp mill, near

Baker City, is dropping ten stamps. The crosscut tunnel failed to tap the payshoot at the depth expected and further work is necessary. H. Myrick has taken an option and bond on the mine.

T. S. Kenoerly, superintendent of the Gold Coin mine, in the Greenhorns, near Sumpter, says machine drills have been put to work this week. The tunnel is 10 500 feet, with 1300 feet yet to drive. The five ledges which this will cut average 4 feet in width and carry good surface values. The Gold Coin adjoins the Phoenix, Don Juan and Goldoos Eagle.

J. Arthur and the engineering firm of McEwon & McEweo of Sumpter have formed a partnership to establish an independent sampling and testing plant at Sumpter which will have a sampling capacity of thirty tons a day and milling capacity of seven tons daily. It will consist of three stamps, 6-foot concentrating machines, a small cyanide plant, with silico tables attached and other equipment for treatment and ore tests for any amount up to 100 tons. There will be a laboratory in connection for custom assaying.

Because the electric power companies that proposed to enter the Cracker basin, near Sumpter, this season show no signs of early work, Manager L. V. Swiggett of the Orleans mine says that he has concluded to put in a steam hoist of 500 feet capacity instead of depending on electrical energy. The shaft will be sunk near the vein, starting in country rock off the haaglog wall.

Work will be resumed on the Newman group, Greenhorn-Bonanza district, near Sumpter, says H. F. Ramm of Bay City, Mich., secretary.

The gasolite hoist on the Humboldt, Greenhorn district, near Sumpter, is in operation and sinklog resumed in the double-compartment shaft, which is down 60 feet, says Superintendent Brady. The hoist has capacity for a depth of 300 feet. They will sink to 200 feet and drift both ways on the vein.

Last week the Geisler-Hendryx Investment Co. bought the Gray Eagle claim, adjoining the Red Boy mine, near Sumpter, and also adjoining the Blue Mountain group, owned by the company.

Manager W. L. Vinson of the Montie G. M. & M. Co. says he has started up the Bryan mill on the Emma mine, near Baker City. This mill has a capacity of twenty-five tons per day.

GRANT COUNTY.

The Badger mine, near Susanville, is shipping sulphurets to the smelter at Tacoma, Wash.

JOSEPHINE COUNTY.

W. T. Cope is developing the quartz mine of Schrimpf Bros. on Maple gulch on the Applegate river, near Provoit, under bond.

SOUTH DAKOTA.

CUSTER COUNTY.

The Black Hills Porcelain, Clay & Marble Co. propose to begin operations on their quarry of lithographic stone, 14 miles west of Custer, and will do some work on its marble beds also. Regular shipments of mica continue from the mine northeast of Custer to Columbus, Ohio.

The Central Black Hills C. Co. have put in machinery at their mine near Custer, says Manager E. M. Barnes, and expect to begin operations next week.

LAWRENCE COUNTY.

The Spearfish G. M. & R. Co., near Spearfish, are running their cyanide mill regularly and making two clean-ups per month.

Manager E. M. Holbrook of the Horsehoe M. Co. says they are still shipping ore to Denver, Colo., from the Lucile and Ben Hur mines, and work on the cyanide plant in Ruby basin, south of Lead City, is progressing. It is expected that this plant will be ready for operation by July 1, and will start with a daily capacity of 500 tons.

The Imperial Co. have operations under way on their Juno lode at Bald mountain, near Lead City. A tunnel will be started lower down than any former workings and to tap the ore bodies at greater depths. The company is opening up ore in the Eagle Chief lode, which is over the divide from the Juno, near Crown Hill station. The mill is running full capacity.

Pending the enlargement of the Dakota M. & M. Co.'s cyanide mill at Deadwood the company has increased development work of the ore bodies.

PENNINGTON COUNTY.

The Holy Terror M. Co. of Keystone have the Keystone 20-stamp mill running on Holy Terror ore. President Hughes says they are taking ore from the seventh and ninth levels of the mine. At present the flow of water is heavy, making it expensive to keep the mine dry. The concentrates will be sacked and held for the present, with a view of sending them to a smelter. The ore from the Keystone is only partially free-milling, carrying also

some values that will not amalgamate, says the Black Hills Review. Experiments have been carried on seeking the best method of treating this ore.

TENNESSEE.

SMITH COUNTY.

There were 100 tons of fluorspar shipped to Nashville last week from a vein being opened up near Rome. The vein is said to be 100 feet wide and it occurs in crystalline masses with distinct cleavage planes, which makes mining easy. The cost of milling is reported at 75 cents per ton, while the selling price is \$7. Most of it will be used in blast furnaces.

TEXAS.

NACOGDOCHES COUNTY.

A strike of gold ore is reported 62 miles east of Douglas, at Antelope pass, on the El Paso and Southwestern Railroad. The find was made in a ledge of white quartz and oxidized iron, 10 feet wide, running northeast and southwest. Assays run \$15. There is water 1 mile away in the Animas valley at depth of 10 feet.

UTAH.

JUAB COUNTY.

The Western Exploration Co., which owns the Sioux-Ajax or Farrell mill at Robinson, has invited bids for the entire plant, which is to be dismantled, says the Tintic Miner.

PIUTE COUNTY.

(Special Correspondence).—The Baslen springs group of C. Mathews, on Deer creek, near Marysville, has been sold to Salt Lake men.—The Iron mine, east of Marysville, is regularly shipping a car a day and will begin shipping two cars a day.—L. H. Bartholomew will begin operations on the tunnel in the Copper Belt this week. Boston men are interested.

Marysville, May 25.

The Ryan holdings in the Golden Star mine of Gold mountain, near Marysville, have been added to the Annie Laurie M. Co. holdings. With this the holdings of the Annie Laurie Co. on Gold mountain, says Manager Rader, are increased to 1364 acres, with 5200 feet along the strike of the ore zone.

SALT LAKE COUNTY.

The management of the Tintic M. & D. Co., operating at Bingham, and in Tintic district (Juab county), have incorporated the Yampa Smelting Co. and the West Mountain Tramway Co., with G. H. Robinson, managing director of the Tintic M. Co. as manager of the new companies. The smelting company by which the furnaces will be provided is organized under Maine laws, the transportation company which will provide economic means for the transmission of the company's Bingham ores under New Jersey laws. On each of these, says Manager Robinson, construction will begin next month.

Work on the tunnel by which the ground of the Mt. Aetna G. & C. M. Co. at Bingham was being opened up was resumed last week, says J. A. Kaufman, manager. The Mt. Aetna adjoins the Last Chance on the south and west.

Although the breast of the drain tunnel, now 6000 feet into the mineral zone, is 2500 feet distant from the main Dalton ledge on the Bingham Con's Bingham properties, the water has been lowered 12 feet, while the flow from the mouth of the tunnel has increased to 2500 gallons per minute, says the Salt Lake Tribune. The Brooklyn ledge is expected to be cut at 140 feet farther. While the tunnel is being driven, the Brooklyn shaft is being cleaned out to the 1500-foot point. On the 1400-foot level Manager McVichie has drifted for 200 feet along the ledge, showing copper-bearing sulphides. At 1500 feet drifts will be started.

Manager F. Cook says the Columbia C. M. Co. will begin work on a concentrator at the Columbia mines, near Bingham, next month.

Manager R. H. Channing of the Utah Con. says work to increase the capacity of its Utah smelter, at Murray, in which the ores of the Highland Boy mine at Bingham are reduced, will begin next month. The smelter is treating 500 tons of ore daily.

SUMMIT COUNTY.

Superintendent Mixer of the Creole mine, near Park City, says he has shut down temporarily, due to surface water. The shaft is down 470 feet and he will go to the 500-foot point before drifting.

UTAH COUNTY.

The Union Chief M. Co. has incorporated at Salt Lake City; A. O. Jacobson, A. E. Snow, J. A. Jacobson, A. D. Larson, A. Snow. The company owns seven full lode claims near Santaquin.

WASHINGTON COUNTY.

R. A. Kirker, of Salt Lake City, has an

option on the aothradic coal measures at New Harmony, 8 miles south of Iron mountain, for Eastern men. The group covers 1000 acres, through which three parallel veins are running and on one of which a depth of 100 feet has been attained.

WASHINGTON.

FERRY COUNTY.

A. E. Palmer of Spokane has bought control of the Mountain Lion group at Republic. He has closed a contract with the Granby Smelter Co. for the entire output of the mine for two years. There is a mill on the ground and the mine has been developed to a depth of 600 feet.

KITTITAS COUNTY.

A 4-foot ledge of free-milling gold ore has been found 30 miles from Ellensburg, on the western slope of the divide between Swank creek and Lyons gulch, says F. J. Loog of Ellensburg.

STEVENS COUNTY.

Manager E. J. Wilson reports four furnaces running on the Le Roi smelter. He is having everything fed against the blast, instead of to the center of the furnace. Ten to twelve charges per hour are going through. Fourteen charges were worked on No. 5, but that could not be kept up. The speller plates are in use again, after an idleness of nine months. The low-grade matte will be resmelted and made high grade before sending to refinery. At present the matte crusher is working entirely on low grade. No coke reserve is on hand and only a few cars in the yard. There is no chance of the works running any length of time, unless a steady supply comes in. There are 300 men on the payroll.

J. W. Douglas of Spokane is interested in the Standard Marble Co., whose holdings are on Young America hill, 1 mile east of Bossburg. Quarrying and finishlog machinery is on the ground.

FOREIGN.

AUSTRALIA.

NEW SOUTH WALES.

Cope's Creek Dredging Co., near Inverell, are making an average output of five tons of tin weekly, of a value of £450.—Tioha Tin Dredging Co. have begun operations, and also the Cope Hardinge Tin Dredging Co.

The output of tin for the year ending December 31 last is 600 tons 2 cwt.; this includes Inverell and Tioha districts. This total tonnage is 70 tons short of the previous year, but for 1903 the returns are expected to reach 1000 tons.

The Australian Gold Recovery Co. has bought the Aladdin and Wentworth tailings dumps at Lucknow, and arrangements have been made for their cyanidation.

WEST AUSTRALIA.

At Coolgardie, the Lady Loch has its 15-head battery in operation on ore mostly from the 650-foot level, running one ounce to the ton.—The Lady Robinson is opening out a new main shaft at the 230-foot level. The company have put in an air compressor and a heavier winding engine.

The annual of the Great Boulder Perseverance G. M. Co., Kalgoorlie, just issued for 1902, shows 140,642 tons of ore and 41,392 tons of oxidized tailings and slimes treated for 193 383 ounces of bullion, valued at £693,215, the profit of which, after deduction of administrative charges in Australia and London, amounted to £412,683 14s 3d. The sum of £37,504 3d was expended on development work and £22,945 7s 8d on equipment accounts. The sinking of the main shaft has been resumed, and it is proposed to open up at 1100 feet and at each 200 feet below that depth.

At Kalgoorlie, in the Oroya north block of the Oroya Brown Hill mine the value of the ore met with in sinking Pomeroy shaft from 860 feet to 864 feet was four ounces per ton, the ore containing telluride.

BOLIVIA.

Advices from Oruro report the finding of tin ore at Tres Cruces.

BRITISH COLUMBIA.

R. Gibbs and R. Grant, operating the White Moose mine, near Atlin, report striking ore showing values in copper, silver and gold.

Negotiations for the sale of the Gibson group, on the South Fork, near Kaslo, for \$30,000 are under way, says Manager A. Smith.

J. Rutherford of Chicago, Ill., has started work on the Glengarnock, on Tenderfoot creek, near Kaslo.

At the Ruth operations have resumed, says Manager H. B. Alexander.

At the annual meeting of the Yreka Copper Co. in Tacoma, Wash., it was decided to open up the Superior group of

claims, which adjoin the Comstock, which is being operated. An aerial tramway will be put to aid the property put on a ship-log basis. C. W. Riddell of Tacoma, Wash., is president.

The Kootenay Co. have decided for the present to suspend operations at the Nickel Plate mine and concentrate their work on Rosland on the Kootenay mine. So soon as the Kootenay has become productive it is intended to resume operations at the Nickel Plate, and also that the Great Western mine will be unwatered and prospected.

Superintendent Hewitt of the Otter Creek Hydraulic Co., on Otter creek, near Atlin, expects to have the plant in full operation by June 15.

Superintendent A. McPherson, at the National Hydraulic, near Quesnelle, is driving ahead the bedrock tunnel begun last fall and expects to break through the bedrock rim into the gravel by June 1, and will then lay a flume in the tunnel and begin piping.—J. Descon is piping on the McLean claim, Quesnelle river.—The boring operations by the Cariboo Con., Ltd., on the Eleven of England, Lightning creek, are progressing. Two holes have been driven to bedrock and another started. J. Windle is foreman.—B. A. Lasell has begun work on Cunningham and Cblna creeks and will be ready to pipe as soon as the water starts.

R. O. Jennings has begun development work on the Deane mine, near the North Star mine, near Fort Steele, says the Rosland Miner.

Trow & Boynton, owners of a placer lease on Perry creek, near Fort Steele, have secured additional ground by bonding from G. Tbel's a half-mile strip adjoining their ground.

The Horseshoe, near Trout lake, has been sold to Philadelphia, Pa., men for \$16,000, says G. W. Stead, manager, who is also manager of the Ethel and Lucky Boy mines.

The Slocan Star Co., Sandon, intend to begin erection of a zinc concentrating, roasting and magnetizing plant next month. The Byron N. White Co. is applying for water rights on Sandon creek to furnish the necessary power. The company has a body of zinc ore blocked out which also shows silver values and contains a percentage of lead.

A strike of 4 feet of silver ore was uncovered on the Empress mine, near Bear lake, near Slocan City, last week. This mine is below the Silver Glance and owned by M. Vankirk.

The Lardeau Eagle says the English company operating the Nettle L. and Silver Cup mines, near Ferguson, have decided that greater profits can be realized by reducing the low and high grade ore at Ferguson, and will build a concentrator as soon as the sawmill can cut the necessary lumber. They will build an aerial tram from the lower terminal of the Silver Cup tram down to the forks of the Nettle L. road (which is across the river from Ferguson) where they will build the concentrator. At the same time another tram will be built from the Nettle L. mine. The concentrates produced will be shipped to the smelter.

The output of Rosland camp is increasing and shipments for the week ending May 16 and for the year to date are as follows:

	Week.	Year.
Le Roi.....	3360	70,194
Center Star.....	1830	31,678
War Eagle.....	1200	21,405
Le Roi No. 2.....	875	10,012
White Bear.....	80	267
Velvet.....	100	2,446
O. K.....	...	25
Giant.....	...	335
Kootenay.....	290	735
Homestake.....	...	90
Totals.....	7735	137,187

HONDURAS.

U. S. Consul W. E. Alger reports from Puerto Cortes, April 18, 1903: Honduras exported in 1902 metals to the value of 2,346,990.26 pesos (\$938,976). In 1898 the exportation only amounted to 1,501,114.18 pesos (\$600,445). The metals exported were: Gold, 23,235 ounces; silver, 1,010,204 ounces; copper, 25,198 ounces.

INDIA.

The annual report of the Nundydroog G. M. Co., Mysore, shows during 1902. treated 55,940 tons for 52,677 ounces of gold and 60,409 tons of tailings for 5357 ounces. The gold realized £218,170, a net amount of £207,332 after deducting royalty. The ordinary expenditure was £109,353. The report states that the Cauvery electrical power installation has proven satisfactory.

MEXICO.

CHIHUAHUA.

E. Baca of Parral is reported to have bought the San Vicente Ferrer mine,

near the La Prieta mine, owned by P. Alvarado.

DURANGO.

Austin, Texas, advices say the American S. & R. Co., through the Guggenheim Exploration Co., its Mexico branch, is reported to have bought the mines of the Descubridora M. Co., near Mapimi, for \$8,000,000 gold.

SONORA.

Manager W. E. Defty, of the American-Mexican M. Co., operating El Provedora de Cobre mine near Calera, near Caborca, in Altar district, says the tunnel is in 230 feet, and has cut the ledge, showing good copper values. A shaft has been sunk 75 feet, and from the bottom a drift run 57 feet in ore.

In Ures district, 15 miles east from Liano, the Mina Grande, El Progreso and San Ricardo mines, antiguas, are being developed by an Eastern company, of which T. F. Turner, of Canton, Ohio, is manager.

The pipe line of the Sonora Quartz Mines D. Co., to convey water from Cienega to the company's works at El Tiro, in Altar district, is finished.

NEW ZEALAND.

Six quartz mines in Otago, from which returns were obtained the past year, crushed 9178½ tons of quartz, yielding 6264 ounces of retorted gold, valued at \$23,826; and 1154 tons of tailings treated by cyanide yielded 234 ounces of gold, valued at \$768.

The Kirwan's Reward G. M. Co., which is quarrying from open face cuttings 30 feet in width on the Victoria Range, in Inangahua district, obtained 2548 ounces of gold last year, value \$10,268, from 3423 tons of ore. The milling capacity has been increased from ten to fifteen heads of stamps.

At the Barrytown Flat hydraulic sluicing claim during the past year 228,000 cubic yards were operated on for 710 ounces of gold, value \$2781 (5.9 cents per yard).

As showing the progress made in gold dredging in Southland during the past few years, it may be stated there are thirty dredges working at Gore, Waimumu, Chariton creek and Waikaka, and these machines require 230 men at work, says the New Zealand Mines-Record. There are two dredges at work at Waikaka, and four are building for the Fair-down, Garryowen, Nugent Wood and Hessey companies. The value of the gold won last year at Waikaka from dredging and sluicing was \$10,000. According to returns furnished the inspector of mines for Marlborough, Nelson and the West Coast, the dredges working in those districts had a total yield of 33,486 ounces of gold the past fiscal year.

Sixteen quartz mines in Marlborough, Collingwood, Westport, Lyell and Reefton districts crushed during the past year 107,871 tons of quartz, which yielded 52,633 ounces of gold, value \$212,150. The Progress mines of New Zealand, Reefton, crushed 55,976 tons, yielding 26,437 ounces; the Golden Fleece, 13,614 tons, for 7000 ounces; Wealth of Nations, 11,566 tons, for 5544 ounces; Keep-it-Dark, 11,405 tons, for 3800 ounces; Welcome, 1776 tons, for 1195 ounces. In Collingwood district the Golden Ridge and Ant Hill mines crushed 3442 tons, for 2223 ounces, and the Golden Blocks 2402 tons, for 2119 ounces. The Jubilee mine at Top Valley, Marlborough, crushed 644 tons, for 152 ounces.

PERU.

The northern part of the Peruvian coast contains coal, petroleum and naphtha. Coal is found in twenty-three provinces and the coal beds being in many places in close proximity to the sea, facilities for its exportation are offered. The principal sources of petroleum are found in the Department of Piura, where the production of each well may be estimated at 3590 to 3696 gallons per day. The petroleum contains little paraffin. The heavy oils are similar to those of Russia. The crude oil can be employed as fuel without other preparation than exposure to the atmosphere in open ponds for a few days.

Books Received.

"Reports of Mining Cases and Mining Statutes of British Columbia" is the title of a valuable volume, in unique morocco binding, by Justice Archer Martin of the Supreme Court of British Columbia. The work will prove of great interest and value to all interested in mining in that Province. Besides a historical review, the work contains reports of cases, a table of all the mining proclamations, ordinances and statutes and an interesting glossary of mining terms. It is the standard authority in mining law in British Columbia. The Carswell Co., Ltd., of Toronto, Canada, publishers.

PERSONAL.

R. D. GRANT of Salt Lake City, Utah, is at Portland, Or.

S. G. BENNETT of the U. S. Geological Survey is in San Francisco, Cal.

L. WALKER is superintendent of the Midway mine, near Sumpter, Or.

J. A. LARGENT of Salt Lake City, Utah, is in Montana on mining business.

C. PETERS of Tonopah, Nev., is in San Francisco, Cal., on mining business.

C. K. COLVIN of Denver, Colo., has returned there from Kansas City, Mo.

A. G. LAMSON returned to Salt Lake City, Utah, from an extended trip East.

J. N. KERR of the U. S. Geological Survey is in San Francisco, Cal., on business.

E. R. REED, interested in oil properties near Bakersfield, Cal., is in San Francisco, Cal.

R. C. WALRATH, interested in mines near Nevada City, Cal., is in San Francisco, Cal.

T. FLEMING, interested in mines at Tonopah, Nev., is in San Francisco, Cal., on business.

A. P. CHITTENDEN is superintendent of the Clio mine at Jacksonville, Tuolumne county, Cal.

W. FLOYD, a mining man of Saulsbyville, Tuolumne county, Cal., is in San Francisco, Cal.

R. ADDOMS has resigned as superintendent of the Alpine M. Co., Cove district, near Sumpter, Or.

W. W. WHITING, Denver, Colo., Western manager Diamond Rubber Co., is in San Francisco, Cal.

A. BLANC has returned to San Francisco, Cal., from a trip through mines in northern California.

J. H. NEALE, owner of the Neale and other pocket mines near Sonora, Cal., is in San Francisco, Cal.

M. SCHUMAN, a geologist of Germany, is making a study of the oil deposits around Kayak, Alaska.

H. L. MILLS, superintendent of the Wedge mine at Marysville, Utah, is in the East on mining business.

W. A. HEWITT, JR., of the Compressed Air Machinery Co. of San Francisco, Cal., has gone East on business.

J. F. CLAPP of Chicago, Ill., interested in Western mining properties, is in San Francisco, Cal., on business.

E. T. LOY, manager of the Minnesota mine, near Chloride, Ariz., is in Los Angeles, Cal., for the summer.

H. S. SHERARD, superintendent of the cyanide plant of the Quartette Co., near Searchlight, Nev., has resigned.

E. M. HAND, superintendent of the Watseca mine, near Rochester, Mont., has gone to New York on business.

E. DANIELL succeeds J. Wilson as head mining captain of the Hecia branch of the Calumet & Hecla at Calumet, Mich.

R. WHINNERAH of Denver, Colo., has gone to Breckenridge, Colo., as mill superintendent of the Mountain Pride mine.

T. E. HENEHAN and W. BURNS of Colorado Springs, Colo., are examining mining interests near Marysville, Utah.

T. T. LANE, formerly of Angels, Cal., is in San Francisco, Cal., from Parral, Mexico, where he is engaged in mining.

L. W. BORGER of Campo Seco, Cal., has taken a position as chemist with the Pacific Foundry Co. of San Francisco, Cal.

R. H. CHANNING, manager Utah Con. Co., with smelters at Murray, Salt Lake county, Utah, is in the East on business.

E. L. HOLLINGSHEAD, of the Weyant M. Co., of Toledo, O., returned to Weiser, Idaho, last week from an Eastern business trip.

F. PLANK, manager for the San Juan M. Co., in Lower California, Mex., is visiting in California from Guaymas, Sonora, Mex.

H. A. BOMBERGER, president La Gloria M. Co., returned last week to Philadelphia, Pa., from their mines near Phoenix, Ariz.

M. J. HUNNEBELLE of Paris, France, a director in the Gold Roads M. Co., near Kingman, Ariz., is in Salt Lake City, Utah.

J. A. CHURCH, consulting engineer for the Old Dominion C. M. & S. Co. at Globe, Ariz., and also for the Shannon

C. Co., near Clifton, Ariz., has returned to Globe from an extended visit to Clifton and Morenci, Graham county, Ariz.

G. GRAHAM and D. O'DONNELL, engaged in mining in Rhodesia, South Africa, are in San Francisco, Cal., en route to England.

N. C. BONNEVIE, of Bonnevie & Lee, consulting engineers, Denver, Colo., has returned from Gunnison county on mining business.

L. F. J. WRINKLE has resigned as instructor in the department of mining engineering at the Nevada State University at Reno, Nev.

W. J. RULE of Sonora, Cal., superintendent of the Belle mine near Tuttle-town, Tuolumne county, Cal., is in San Francisco, Cal.

E. M. HOLBROOK will resume management of the Horseshoe M. Co., near Deadwood, S. D., vice W. L. McLaughlin, manager pro tempore.

NORMAN A. ROOT will represent the Hallide-Henshaw-Bulkley Co. of San Francisco, Cal., in Portland, Or., and Seattle, Wash., after June 1.

E. H. WILEY, manager of the Big Creek M. Co., operating near Groveland, Tuolumne county, Cal., has gone to Maine to attend a director's meeting.

J. TERRELL of the Clement Syndicate, owning the Castle Peak mines, near Bodie, Cal., has returned to London, England, from a visit to the mines.

L. E. WILLIAMS, secretary and treasurer of the King Verde G. & C. Co. of Glenwood, Iowa, is visiting their mines at Quartzsite, Yuma county, Ariz.

A. MIDDLEBROOK, manager Denver branch Jeanesville Iron Works Co., manufacturers of mine pumps, has returned from a business trip to Arizona.

O. C. WRIGHT of Van Vleet & Wright, and president of the Blue Bird M. Co., returned to Sumpter, Or., last week from a trip to New York on mining business.

C. J. MOORE returned to Cripple Creek, Colo., last week from an extended trip to northern Nevada and to the La Salle mountains of Utah, examining mines.

P. SCHABARUM, manager for La Dura M. Co., whose mines and works are at La Concentracin and La Dura, Sonora, Mex., has gone to Germany on a visit.

A. W. JENKS, until recently manager of the Minera de Penoles mines at Durango, Mex., is manager of the White Knob copper mines at Mackay, Idaho.

BAILEY WILLIS, formerly of the United States Geological Survey, has been appointed to the Carnegie Institute, and will go to China for geological investigations.

PRESIDENT P. A. H. FRANKLIN of the Franklin M. Co. has returned to Salt Lake City, Utah, from the mines of the company at Marysville, Piute county, Utah.

J. W. DOUGLAS, of the Standard Marble Co., operating east of Bossburg, Wash., returned to Spokane, Wash., last week from a three months' trip to Boston and New York.

A. J. STEVENS, president, and A. I. Richardson, manager, of the Black Mountain M. Co., are at the mines of the company in Silver Creek, near Kingman, Ariz., from Los Angeles, Cal.

H. F. BAIN, former assistant manager of the Independence Con. mine, Cripple Creek, Colo., will have charge of the editorial work of the geological folios of the U. S. Geological Survey, Washington, D. C., vice B. Willis resigned.

Commercial Paragraphs.

J. H. ADAMS, of San Francisco, Cal., started for Nome via Seattle, Wash., on the 23rd inst. He takes with him three Adams hydraulic lifts, two giants and the necessary gates, pipes, etc., for two complete plants.

THE Stillwell-Bierce & Smith-Vaile Co. of Dayton, Ohio, write the Yankee Con. M. & M. Co. at Yankee, Colo., are installing a Stillwell feed-water heater in their new steam power plant which will operate the mill they are building.

THE Ironsides Co., Columbus, Ohio, reports the business of its past fiscal year, just closed, as showing a gratifying increase, with favorable prospects for a further enlarged business in the coming year. The company manufactures and supplies special lubricants for wire ropes, fiber ropes, gearing and belting, a line of

paints for metallic surfaces, and the Ironsides improved car wheel roller.

BROWN CORLISS ENGINE CO., of Corliss, Wis., writes that H. R. Cornelius of Pittsburgh, Pa., for a number of years direct representative of the Southwark Foundry and Machine Co. of Philadelphia, Pa., has entire charge of the output of the Brown Corliss Engine Co., in Pittsburgh district, and has opened up offices in the Frick Building.

THE Burnham-Standford Co. of Oakland, Cal., report shipping ten portable houses to Carmel-by-the-Sea, Monterey county, Cal. The demand for buildings manufactured by this company has grown rapidly within the past three years. A new 24-page catalogue, with illustrations, showing many new and attractive styles of these portable buildings, will be mailed on request.

Obituary.

M. KOPP, formerly interested in mining in Tintic and West Tintic districts, Juab county, Utah, died at Salt Lake City, Utah, on the 18th inst., aged 48 years.

J. WALL, a pioneer miner of Montana, a resident of Basin, Jefferson county, died on the 17th inst. in Helena, Mont., from a complication of diseases, from which he had been suffering for the past year. He owned an interest in the Saturday Night and Standard mines and some property in Basin. Deceased was born in County Antrim, Ireland, in 1847, and is survived by a widow and one son, in Brooklyn, N. Y., and a brother, in Butte, Mont.

Catalogues Received.

The Stillwell-Bierce & Smith-Vaile Co. of Dayton, Ohio, have issued catalogue No. 53, descriptive of their pumps, water heaters, compressed air machinery, etc. It contains over 100 handsomely printed pages, with many superb illustrations of their various types of machinery.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 19, 1903.

- 728,614.—FLOOR SCRUBBING DEVICE—M. C. Bliss, New Whatcom, Wash.
- 728,360.—FISHING SPOON—C. F. Breidenstein, S. F.
- 728,678.—TIRE—L. C. Cummings, Pasadena, Cal.
- 728,375.—DENTAL VULCANIZER—C. A. Davis, Pasadena, Cal.
- 728,680.—ARTIFICIAL FUEL—J. T. Davis, S. F.
- 728,562.—SAW FILING, GAUGE—S. J. Galloway, Hillsboro, Or.
- 728,702.—REFRIGERATOR—George & Rademacher, Los Angeles, Cal.
- 728,391.—EXCAVATOR—Grant & Shears, Los Angeles, Cal.
- 728,393.—WATER WHEEL BUCKET—G. J. Henry, Jr., S. F.
- 728,803.—SEED PLANTER—P. Le Sueur, Calabasas, Cal.
- 728,493.—BED—T. L. Mahoney, S. F.
- 728,463.—CARRIER—McGehee & Lathwesen, San Jose, Cal.
- 728,404.—CARTON—McGehee & Brower, San Jose, Cal.
- 728,487.—HYDRAULIC CLASSIFIER—C. W. Merrill, Alameda, Cal.
- 728,752.—ELECTRICAL APPARATUS—Naphtaly, Jones & Varney, S. F.
- 728,756.—LOCK AND LATCH—M. C. Patrick, Seattle, Wash.
- 728,415.—CUFF HOLDER—W. T. Robinson, S. F.
- 728,419.—BALL AND SOCKET KNUCKLE—S. A. Scheelenger, Gridley, Cal.
- 728,811.—LEVER VEHICLE—J. Scott, S. F.
- 728,314.—ROCK DRILL—V. Y. Smith, Globe, Ariz.
- 728,423.—FLOOR SURFACER—Spence, Prugh & Zimmer, Oakland, Cal.
- 728,337.—GAME—C. Tanron, S. F.
- 728,621.—CLUTCH—E. Turney, Portland, Or.
- 728,534.—SHIPPING CASE—C. R. Walter, S. F.
- 728,527.—HEATING STOVE—J. H. Waters, Tacoma, Wash.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDRAULIC CLASSIFIER.—No. 728,487. C. W. Merrill, Alameda, Cal. This invention relates to an apparatus which is especially designed for separating the heavier or coarser from the lighter or finer components found in tailings of ores or other valuable products, these separations being technically known as "concentrating" and "classifying." It consists of a closed downwardly convergent receiver with a central discharge opening at the bottom, a centrally located supply opening at the top, a water chamber surrounding said opening and having a sloe supply opening and a bottom slotted to form a continuous channel opening into the receiver near the inner periphery of said receiver, and a source of supply connecting with the opening at the top of the receiver.

Latest Market Reports.

SAN FRANCISCO, May 29, 1903.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 53½c, refined (1000 fine); San Francisco, 53½c; Mexican dollars, 42½¢; 42½c San Francisco, 42½c New York.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50@14.75; Electrolytic, 1 to 3 casks, \$14.50@14.75; Casting, 1 to 3 casks, \$14.50@14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £61 7s 6d spot per ton.

Copper shows no material change and the market is described as dull, there being nothing unusual in either supply or demand. The demand for copper has largely increased the past few years, but the output has increased proportionally, due to the opening of new Western mines and increased output of old ones.

LEAD.—New York, \$4 37½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £11 12s 6d per long ton=2.75c per lb.

SPELTER.—New York, \$5.75; St. Louis, \$4.60; London, £20 17s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 100-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$28 45@28 65; San Francisco, ton lots, 30½c; 500 lbs., 31c; 200 lbs., 31½c; less, 32c; bar tin, 3½c, 35c @37½c. London, £129 15s spot.

PLATINUM.—San Francisco, crude, \$18.00 @ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$44.50@46.00; large lots, London, £8 15s; San Francisco, local, \$45.00 @ flask of 76½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16.75c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$19.75 @20.25; gray forge, \$19.85; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31.50; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.25; Cut, \$3.35; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$3; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c @ set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2.50 @ 2 75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50@2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 4c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25@26c @ lb.; carloads, 23@24½c; in tins, 35c; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 2½@2½c @ lb.; caustic soda, in drums, 3@4c @ lb.; Cal. s. soda, bbls., \$1.25@1.50 @ 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; borax concentrated, 7@8c @ lb.; roll sulphur, 4@6c; powdered sulphur, 2@3c; flour sulphur, French, 2@3c; alum, \$2.00@2.25; California refined, 2@2½c; sulphide of iron, 9c @ lb.; copper sulphate, 5@7c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 2½c @ lb.; nitric acid, in carboys, 8c @ lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50 Brymbo, \$7.50; Pennsylvania, hd., \$14.00 Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @9c per lb.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

BORAX.—Concentrated, 7@9c per lb powdered, 9@12c; fused, 25@30c.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5@7c.

MANGANESE.—Pure, 3½ lb., 60c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

BISMUTH.—Subnitrate, per lb., \$1.60.

SODIUM.—Metal, 3½ lb., \$1.00.

MERCURY.—Bichloride, 3½ lb., 90c.

PHOSPHORUS.—(American) 3½ lb., 75c.

SILVER.—Chloride, 3½ oz., 90c@1.00; nitrate, 55c.

ALUMINUM.—No. 1, 99%, small lots, 37c @ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, 3½ lb., \$3.50.

ZINC.—Metallic, chemically pure, 3½ lb., 50c; dust, 3½ lb., 10c; sulphate, 3½ lb., .04c. (These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

CYANIDE CHEMIST OR MILL SUPT. TECHNICAL graduate. Specialty, construction; also, successful treatment of low grade ore and slimes. Good references. Address "Spanish," this office.

FIRST-CLASS METALLURGICAL CHEMIST and Assayer desires position. Can furnish best of reference, etc. Address C. W. L., this office.

MILLMAN DESIRES POSITION WITH GOLD mining company to erect or take charge of stamp mill. Extensive experience gained in the treatment of ore in United States, Central and South America. Can assay and test ores to determine best method of treatment. Excellent references. Address "Aurum," care of this office.

HELP WANTED.

Practical All Round Copper Smelterman.

Must be able to emit ore containing the following: Copper 4.37, Silica 38.00, Lime 2.33, Manganese 0.31, Sulphur 0.33, Iron Oxide 17.33, Alumina 4.33. Fuel, coke—F. & C. 33 in Water Jacket. No flux. Good position for man who can do the work. State salary expected, experience, and give reference. Address Box 38, this office.

ZANE & THOMAS.

CHEMISTS AND ASSAYERS.

All work done by or under the immediate supervision of Mr. O. W. Zane, who has had twenty years technical experience in mining and metallurgy. Thorough technical knowledge of all modern practices. Mine and metallurgical reports.

Room 15, 205½ S. Main St., Los Angeles, Cal.

L. VOGELSTEIN, 90-96 Wall St. NEW YORK.

...REPRESENTING...

ARON HIRSCH & SOHN,

HALBERSTADT, GERMANY.

COPPER, ARGENTIFEROUS AND AURIFEROUS COPPER ORES, MATTES AND BULLION, LEAD, TIN, ANTIMONY, SPELTER.

WANTED.

WANTED--MILL TAILINGS.

Gold, silver or lead, in New Mexico, Arizona or old Mexico. Will buy or lease. Give location, quantity and value. A. E. VAN VELSAN, Telluride, Colorado. Box 181.

Wanted---A Superintendent

For foundry, forge, machine and boiler shops employing 20 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answers confidential. Address Z. P. O. box 133, Station C, Los Angeles, Cal.

MINING STOCKS WANTED.

If you are a stockholder in any good going mining company and want to sell your shares

WE CAN GET YOU CASH.

Send for our price list of 500 stocks. It tells what we will buy and what we will sell.

CATLIN & POWELL, 94. 35 WALL ST. NEW YORK.

FOR SALE.

Tonopah Claims for Sale.

I have several good prospects for sale, located in known mineral belt in Tonopah mining district. Groups suitable for incorporation. Claims \$100.00 to \$250.00 each. Correspondence solicited.

Address WALTER OSBORN,

BOX 309, TONOPAH, NEVADA.

FOR SALE FOR CASH OR WILL BOND.

ONE FULL CLAIM

with water right and millsite. Partially developed. Prospects well in free gold. Will stand full investigation. Will deal with principle only.

Address J. M. QUINN, Big Oak Flat, Cal.

MONEY LOANED MINES.

Developed or partly developed which have Ore in sight. First-class references. Established 1855.

E. N. BREITUNG & CO.,
Marquette, Mich.

Michigan College of Mines.

F. W. McNAIR, President.

A State institution making use of the facilities of the great Lake Superior mining district. Regular summer term begins June 8. For Year Book, giving list of graduates and their occupations, apply to President or Secretary.

Houghton, Michigan.

TO TOOL SHARPENERS

and **AMATEUR TOOL SHARPENERS!** I will send formula, with full instructions, by which you can temper machine or hand steel so that it will stand in any kind of rock and not chip, batter or break. Result of twenty years' practical experience in Rocky mountains. Price 50 cents. Satisfaction guaranteed or money refunded. C. H. Bennett, 50 Mill St., Aspen, Colo.

THE Davis Hydraulic Elevator.

THE LATEST AND MOST IMPROVED TYPE OF HYDRAULIC ELEVATOR.

Will handle more material and withstand more wear than any other elevator on the market.

FOR SALE AT A REASONABLE FIGURE.

H. W. DAVIS, Auburn, Placer Co., Cal.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the National Cons. Mining Company will be held at the office of the company, 773 Mission St., San Francisco, California, on MONDAY, the 1st day of June, 1903, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

FLEMING'S PRACTICAL TANNING.

A New and Absolutely Up-to-Date American Book.

READY APRIL 16, 1903.

Practical Tanning: A Handbook of Modern Processes, Receipts and Suggestions, for the Treatment of Hide, Skins and Pelts of Every Description. By Louis A. Flemming, American Tanner. 8vo. 460 pages.

Price \$4.00 by mail free of postage to any address in the world. By express C. O. D. freight paid to any address in the United States.

CONTENTS: Chapter I. Sheepskins. II. The Manufacture of Chrome-Tanned Sheep Leather. III. Sheepskins: Alum, Oil and Napa Processes. IV. Wool Skins: The Tanning of Shearings, Sheep Pelts for Mittens, Rugs and Similar Purposes. V. Sheepskins: Bark Extract and Chamolins Tanning. VI. Goatskins: Beamhouse Work, Preparing the Skins for Tanning. VII. The Chrome Tanning of Goatskins. VIII. The Finishing of Chrome-Tanned Goatskins into Colored and Black, Glazed and Dull Leather. IX. Dogskin and Indian-Tanned Goat and Sheepskins. X. Patented Processes of Tanning and Tawing. XI. Deerskins. XII. Patented Methods of Deplucking. XIII. Patented Processes of Bating. XIV. The Manufacture of Calfskin Leather. XV. Calfskins and Chrome Processes. XVI. Calfskins: Vegetable and Combination Tanned. XVII. Calfskins Tanned for Glove and Mitten Purposes. XVIII. Tanning Furs and Hairskins. XIX. Kangaroo Leather. XX. Methods of Bleaching Leather. XXI. Preparing Heavy Hides for Tanning. XXII. Side Leathers for Shoe Purposes and Methods of Tanning Them. XXIII. The Coloring, Fat-Liquoring and Finishing of Hemlock, Gambier, Palmetto, Quebracho and Combination-Tanned Sides into Shoe Leather. XXIV. Horsehides and Coltskins. XXV. Harness, Liner, Strap, Belt, Bag, Case, Laces and Russet Leathers. XXVI. Miscellaneous Information. Appendix. Beamit, One-Bath Beamhouse Process. Index.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

An elaborate Circular of 4 pages, quarto, giving the full Table of Contents of this important book, will be sent free of postage to any one in any part of the world who will furnish his address.

Skips vs. Cages.

The announcement that the Portland Company at Cripple Creek, Colo., have discontinued the use of cages in their main shaft in favor of skips is another indication of the increasing favor in which this method of ore handling in mines is viewed. By the cage system, employing two or three "decks," a large tonnage can be hoisted daily, and there are other advantages, as in the handling of men and materials. It also renders the construction of ore bins beneath the stations unnecessary, and at first thought one would be inclined to give the preference to the cage system; but long experience and observation by mining engineers, who consider every branch of their business, and who carefully weigh the cost of every item of the expense account, show that skips can handle ore less expensively than cages where the hoisting plant is of the same capacity. Although the employment of skips necessitates the construction of ore bins and gates below each station at the cost of several hundred dollars for each bin, there are advantages in favor of the skips which cannot be denied. Ore may be trammed as rapidly as the stopes can supply it, and the trammers may dump the cars into the bin beneath the station, and return immediately to the chutes to reload. Should the ore accumulate in the bins more rapidly than it is drawn into the skips, so much the better, as it affords a supply upon which to draw should there be a stoppage in stoping from any cause. If all the waste broken in the mine is not utilized in the mine for filling, the bin beneath the station may be divided by a partition, and, when necessary, waste may be dumped on one side and ore on the other. One of the chief advantages in the use of skips is the saving of time of trammers at the shaft. The carman does not have to wait for a skip, nor has the skip tender to wait for ore—generally speaking, though exceptions have been noted.

In mines where there is a considerable volume of water to be raised to the surface, it has long since been demonstrated that skips can remove the water more economically than by pumping. For this purpose skips of large size may be used. The first cost of the plant is but a small fraction of that of a heavy pumping plant, and the cost of power is much less than with pumps. Skips are always ready in case of emergency, such as an unexpected influx of water,

and the hauling capacity may be increased by placing in larger skips or running more rapidly, or a combination of both. A skip of three tons capacity is not abnormal in size; in fact, in some mining districts, it is considered under average size. There are few cages hoisting more than three tons at a load. Both skips and cages may be run in balance, so there is no advantage to either in that respect; but, for general utility and economy, skips are preferable to cages for shafts of any inclination, while cages cannot be run to advantage on shafts having less than a 65° pitch. As to rapidity of running, a skip may be run as rapidly as a cage, and both slide in guides in vertical shafts; but in inclines where skips are in use, the skips run on wheels and a guard rail should be provided to prevent derailment when running at high speed. Where skips are employed for hauling water, valves placed in the bottom are necessary, and these should be protected by some device which will break the force of the blow when the skip strikes the water. In the sump it is absolutely necessary to have a guard to prevent the skip leaving the track when the skip strikes the water, for there is always a tendency for the skip to be lifted from the rails if the engineer does not lower slowly upon approaching the surface

New Head Frame Mizpah Mine, Tonopah, Nevada.

of the water. A number of devices for this purpose were recently shown herein in an article on unwatering mines in the anthracite regions of Pennsylvania.

A New Steel Head Frame.

The accompanying illustration is that of a steel head frame recently constructed over the main shaft of the Mizpah mine of the Tonopah M. Co. of Tonopah, Nev. While the design does not fully meet the ideas of the most modern head frame construction, for use under similar conditions, it will undoubtedly meet every demand that may be made upon it. Furthermore, it is an indication of the progressive and enterprising spirit that prevails in the new Nevada mining camp. There are many old mining camps where steel head frames are not yet considered a necessity. In central Nevada, however, there is no timber of any description, not to mention that suited to the construction of head frames, consequently a steel frame is but slightly more expensive than one of timber would be under the existing conditions. The new steel frame has been built over the old wooden frame, which also shows in the illustration. In some instances where it is planned to sink a deep shaft and to eventually install a heavy head frame and large hoisting plant, the temporary hoist is located at one side while sinking in order that the contemplated heavy construction may be interfered with as little as possible. Ten years ago steel frames were an innovation in the United States, but they are becoming common now, and in the future, when the relative cost of steel and wooden frames is not widely different, it may be anticipated that steel frames will be preferred and built. Designs may also be expected to change from those commonly employed in wooden frames, though wooden frames may be built on the same lines as steel frames.

Why the Prospector Sells.

The prospector or claim owner who offers his claim for sale is not infrequently asked, "If your claim is so good why do you not work it yourself?" This seems a pertinent question, but is it? The man who has the grit to shoulder his blankets, tools and little store of "grub" and goes out into the wilderness of mountains, or trudges wearily over broad stretches of desert sand deserves success, and he is often rewarded. When he "packs his kit" he goes with the hope of finding something, and usually with the intention of selling it if he succeeds. As this has been his purpose from the outstart it is not strange that he should return to civilization loaded down with specimens of his find, nor is it curious that he should offer for sale that which he believes to be valuable. He has no capital to equip and work it himself, and in many cases would not know how, if he had the means and disposition to do so. Most men who are in business know nothing of the experiences and misfortunes, the joys and disappointments of the mine hunter, but they are usually anxious to sell to advantage whatever they may have that is salable, whether real estate, merchandise or knowledge, yet nothing is thought of it. So the prospector when he has found a good vein hastens to the money market to sell that which is his capital or stock in trade. Many good bargains have resulted between prospector and buyer—good for both the miner and capitalist. The principal difficulty that the prospector encounters in the endeavor to realize on his find is the exaggerated value he places on a prospect. Ordinarily he calculates the amount of money he can conveniently use before he dies, and whatever sum strikes his fancy is the price he puts upon the mine, but this figure does not always harmonize with the ideas of the investor, who is inclined to look into the proposition with a view to getting his money back some day. The frequency with which the investor fails to do this shows that it is necessary to investigate any "bargain" in the way of a mining claim

fully before paying out cash. Under most circumstances there is little trouble in selling a good well-developed mine—one which upon examination shows good pay—but there is often some difficulty, and occasionally more or less disappointment, in attempting to dispose of poor property. The prospector is indispensable to the advancement of mining, but the prospector does not represent a class of men who successfully operate mines. There are three classes of men required to make a success of mining—the prospector to find and partially develop the mine; the capitalist to equip and fully develop it; and the trained, practical miner to manage and operate it. In this combination lies success. Occasionally all three of these are found in a single man, but he is comparatively rare.

The Concentration of Ores.

All branches of metallurgy are advancing and improvement is being made frequently in processes long in use. New methods, too, are being given consideration; but in no branch of metallurgical science has such advancement been made as in concentration of ores. There are many districts where the high-grade ores have been worked out, and now nothing remains but low-grade sulphide ores. In other districts only low-grade ores are found. In either case the low-grade ores are unprofitable, or only profitable to a limited extent, unless they can be concentrated economically and the resulting sulphide mineral treated by one of the several processes by means of which the values may be extracted. There are some peculiar notions and prejudices prevalent, the result of years of practice; but the modern, up-to-date metallurgist realizes that some of these time-honored methods are not the best or most successful; but it is often difficult to overcome this prejudice in favor of long-used methods, even though it be known that such methods do not give the highest attainable results. Many ores can not be treated by a single, simple process. Some ores which for years were treated by amalgamation only are now amalgamated, the pulp concentrated and the tailings cyanided, and the values remaining after this series of treatment are commercially valueless.

The Homestake mine, in South Dakota, is an example of this. In the early history of the mine the ores found at and near the surface were as free-milling as could be desired. The gangue was quartz with hematite, the iron oxide representing the oxidized sulphide since found in depth. As the development of the mine proceeded downward, the sulphides gradually replaced the oxidized ores, though at one place the red ore extended to a depth of 400 feet. With the appearance of the sulphides the values in the tailings commenced to run up, augmenting with the increasing quantity of sulphides. The sulphides, almost wholly iron, were considered too low grade to ship to distant smelters, there being no smelters other than those adapted to the treatment of lead ores in the Hills at that time. The chlorination process was not tried there and the practical application of the cyanide process was unheard of up to 1887. However, the management, reasoning rightly, that in time the sulphides might prove valuable, attempted a rude concentration of the tailings by passing them over strips of Brussels carpet. Two "blanket houses" were built, each over 300 feet in length, the tables in each of these houses having a different grade, though the result was not materially different. The tables were narrow—about 28 inches wide—to accommodate the carpets, which were laid in long strips. Over these the pulp was run, there being several strips in each plant. When the tailings had run a given time over the "blankets," as they were called, the pulp was turned into the other sluices, and, without cleaning by running clear water over them, the carpets were taken up in sections, loaded in a wheelbarrow and wheeled to a tank at the lower end of the building, where they were washed. This was done by placing the carpet on one of two cross bars over the open tank. The end was passed under water and laid upon the second bar. Fold after fold was treated in this manner, and when finished the carpet was wheeled back and replaced in the sluice, still carrying about 20% of its original load. When all the sections of carpet in the long sluice had been washed in the manner described and replaced in the sluice, the stream of pulp was again turned on and

another sluice cleaned up. For years this practice continued, resulting in the accumulation of large quantities of low-grade sulphides containing about 40% silica.

The large amount of low-grade sulphide concentrated on the carpets were sold to the pyritic smelter at Deadwood several years ago, and for some time the Homestake company disposed of all their concentrates in this manner.

Notwithstanding their precautionary measure of blanket concentration, the value of the Homestake tailings continued to increase with greater depth of the mine workings, until the tailings were worth \$1.50 to \$2 per ton, and millions of tons of material of this value passed down and lodged along the streams into which the mill races drained, the deposit being carried for miles. Since 1878 these great mines have daily sent down the streams leading from the mills from 2000 to 3000 tons of sand—at an average of 2500 tons per day, an aggregate of over 20,000,000 of tons. In the later years, as above stated, these tailings contained considerable values, and they are now being treated at various places, it is claimed, with success. The Homestake Co. has within the past few years adopted the latest ideas in metallurgical practice and the tailings are now only worth a few cents per ton, and an effort is being made to reduce this small loss still further. Elsewhere concentration has been developed on an elaborate scale. Among the numerous schemes for concentration may be mentioned: Single, crushing to a given mesh, and single concentration on a table or belt machine, crushing and concentration and further separation by the electro-magnetic separator, as applied to the separation of zinc sulphide from iron, lead and copper sulphides. A third method is crushing and concentration with reconcentration of middle product.

In the concentration of sulphides in gold ores, containing only a small percentage of sulphide material (less than 5%), good results are usually produced by passing all the pulp from a 5-stamp battery over a shaking table; tailings to hydraulic classifiers, with elimination of valueless coarse sands, and fines to belt concentrator. If values still remain, which no adjustment of the concentrating machines or classifier can remedy, the tailings from the belt machine may be further treated by passing over a canvas plant, with or without a classifier between the belt and the slimes table. It is good business to continue to concentrate as long as the result is profitable, but no more operations should be carried on than are necessary to insure commercial success.

The Legislative Day.

An unfortunate phase of the present labor situation is an increasing distrust in the outcome of all the agitation. Mines are idle and would-be investors are withholding their financial support from new or contemplated mining enterprises for the fear that further demands may be made by miners' unions, which the value of the ores would not admit. Mining is usually carried on for profit, but when no profit is discernible capital seeks other channels than mining for investment. One of the most unfortunate things in the labor situation is legislative interference in the matter of fixing hours for labor. In Western Australia the legislative body has even fixed the wage rate, and it is said that only a few of the richer mines can afford to pay the State scale of wages. In Arizona mine operators have undertaken to evade the eight-hour law by offering to pay men by the hour on a basis of 35 cents per hour, but that this will prove mutually satisfactory is doubtful, for there is a penalty for employing men more than eight hours during any twenty-four, though the workman may be willing to work "overtime." On the whole, perhaps, the most satisfactory manner of harmonizing the differences between employer and employee is by the contract system, but in some districts where demands have been made for shorter hours and increased pay the unions have decided that no contract work shall be permitted. An instance of this may be found at Tonopah, Nevada. The idea seems to be to get all the money possible for the least hours possible, and at the same time to secure all the work possible to the greatest number of men under these conditions. To this end the present method of operating on the part of labor organizations certainly tends, not only in the mining industry, but in other industrial and commercial branches as well.

CONCENTRATES.

THERE is no known method of annealing high manganese steel.

"CAPLE" is a Cornish name for granite which has a peculiar mottled appearance due to metamorphism, and is found as an accompaniment of tin-bearing veins.

AT present silver quotations the mint seigniorage on a silver dollar is 51.815 cents. Silver 53½ cents an ounce, 371½ grains (the amount in a silver dollar), is worth 41.185 cents as a commodity.

A COLUMN of water 1 foot in height gives a pressure of 0.433 pound per square inch at the base. A water column in a mine 1000 feet deep gives a pressure of 433 pounds per square inch at the pump, when the water is not flowing.

BEAUTIFUL, FINE, CLEAR, RED, CRYSTALLIZED SPECIMENS OF REALGAR (sulphide of arsenic) are sold by Eastern mineral dealers at from \$5 up. They come from the Hartz. Crystallized realgar specimens are not found in the United States.

THE rock samples from Grave, Oregon, are evidently the result of silicification of a dike rock, probably felsite. It is difficult to distinguish between siliceous felsite and chert from limestone. The rock contains iron sulphide and may be gold-bearing also.

THE Field Columbian Museum of Chicago owns the finest collection of Breckenridge Colo., free gold specimens known. Some beautiful crystallized specimens are in the collection. There are many specimens of wire gold. The collection is valued at \$25,000.

THE finds of native silver in connection with the native copper ores of the Lake Superior region are becoming scarcer each year. At times masses of native silver weighing a hundred pounds or more have been found. No mineral cabinet is complete without one or more of these specimens.

THE rock from the Bell Ranch, San Miguel county, N. M., is evidently the result of alteration of limestone. It contains a large percentage of calcium carbonate, with iron oxide and a little manganese oxide. Not particularly valuable unless it contains precious metal for which it was not tested. This should be determined by assay.

CONDENSING engines require from twenty to thirty times the amount of the boiler feedwater, for condensing purposes. An approximation, for estimating purposes, is one and one-quarter gallons condensing water per minute per indicated horsepower. It is usually estimated that a condenser will decrease the fuel consumption by from 20% to 25%.

THE American standard boiler horsepower as adopted is: Thirty pounds of water evaporated per hour at a boiler pressure of seventy pounds, the temperature of the feedwater being 100° Fahrenheit. For example, a boiler evaporates 300 pounds of water per hour, boiler pressure seventy pounds, feedwater 100° Fahrenheit, then the boiler would be $300 \div 30 = 10$ H. P.

NATIVE ARSENIC is but sparingly found in the United States, a small quantity having been found in Maine and New Hampshire. No good specimens have ever been found. The silver mines of the Hartz, in Germany and Austria, produce massive specimens of native arsenic. Native arsenic is tin white in color and a very heavy metal. On exposure to the air it quickly tarnishes to dark gray.

THERE exists a big demand for high-grade graphite mines, and, in fact, low-grade ore finds a ready market. The high-grade material is very scarce in the United States, but few are in operation and the production is very limited. High-grade graphite is necessary in the manufacture of lead pencils, crucibles, etc. Low-grade ores are used in the manufacture of pigments, lubricants, etc.

THE expedient of crushing gold quartz through a coarse screen in a stamp battery and the subsequent grinding of the granulated rock in rotary mills has been accomplished successfully. It usually results in increased capacity of the plant, if not in lower grade tailings. In some mills where the rock coming from the mine consists of a large amount of soft, slaty material, rotary mills have been used to advantage.

A "STOPE" is an excavation resulting from the removal of ore from a vein or deposit. It is usually understood to mean an excavation above a drift or tunnel. When the excavation has been made downward, beneath the level or drift, it is called an "underhand stope." The use of the term "stope" to indicate a mass of ore blocked out by development work, but not yet removed, is a misnomer, and an improper application of the term.

THE finest specimens of celestite (strontium sulphate) in the world are found in Strontian island, Put-In-Bay, Lake Erie. They are beautifully crystallized and blue

ish color. Witherite (barium carbonate) is found crystallized in repeated twins, color white, yellow and gray. Witherite specimens all come from England, and it is a peculiar fact that the United States has produced no witherite specimens of value, a few having been found in Kentucky and in Lake Superior.

A 1½-INCH round steel rope, weighing two pounds per foot and with a breaking strain of 84,000 pounds, should sustain itself with a length of 42,000 feet before breaking from its own weight. Taking the usual factor of 7, then the safe working length of such a rope would be 6000 feet. If a weight of three tons is hung on the rope, equivalent to a loaded cage, the maximum length at which such a rope could be used, with a factor of safety of 7, would only be 3000 feet.

THE question is not so much the grade of the ore as the quantity of it and the ability to treat it at a profit. Even if the ore does go but \$3 per ton, there are numerous prominent examples of big profitable mining properties where the ore averages much less, yet they pay big dividends. This is made possible by the amount of the ore, the skill of the producers and the economical methods of handling. There is profit in \$1 gold ore and in 1% copper ore under favorable conditions.

THE horse power, the quantity of work required to raise 33,000 pounds 1 foot in one minute, denoted by the symbol H. P., is referred to now as the mechanical horse power, with a symbol written M. H. P., to distinguish it from the electrical horse power, or kilowatt, for which the symbols E. H. P. and K. W. are employed. The electrical horse power is a mechanical horse power multiplied by 1.34048. Electric generators are estimated in kilowatt units and electric motors in M. H. P. units.

IN the zone of oxidation of the Broken Hill mines of New South Wales there are large amounts of black oxide of manganese. These oxides are presumed to be the result of alteration of rhodonite and manganese silicate, which occurs abundantly in the sulphide zone. As a probable intermediate product of this alteration there occurs in isolated places rhodochrosite (manganese carbonate) near the sulphide zone. The abundant occurrence of rhodonite in the sulphide zone makes concentration more difficult than it would otherwise be.

AT the smelters of the Mount Lyell Copper Co. in Tasmania it was found that with straight pyritic smelting from seven to twelve days was as long a run as could be made on an ore mixture containing 20% of an acid aluminous schist, but treating Mount Lyell ore alone the time of campaign would be much extended. With the former mixture the addition of 1800 pounds of coke to the furnace during each twentyfour hours (less than 1% of the charge), as certain symptoms appear, is sufficient to extend the campaign to forty days, and it might be much longer if it were not for careless feeding when much fine material is sent to the smelter.

CASSITERITE is oxide of tin. It has a gravity of 6.8 to 7.1, and may be readily concentrated. It has an adamantine luster. The color is brown, black, red, gray, white or yellow. The pulverized mineral is whitish, grayish or brownish, often pearly in luster. Nearly transparent to opaque. Occurs in dikes of coarse-grained granite and in veins of black fine-grained tourmaline; usually in granitic rocks. Cassiterite is insoluble in acids excepting concentrated sulphuric acid. It is easily reduced to metallic tin when heated on charcoal with soda. Without soda the natural oxide of tin is infusible.

CO-OPERATION in mining or building a smelter or other plant is an excellent idea, theoretically, and often works all right, but it must be borne in mind that there is no particular advantage about co-operation that will enable anything worked under that plan to avoid or escape the adverse conditions that may arise. The right kind of ore for the smelter; the ability to run it at a profit; the power to suit the customers and the knowledge to successfully meet changing conditions are points in the business that are not covered by co-operation any more than by monopoly, or individual enterprise. The question of profit or success lies outside of the manner of ownership.

TO FIGURE out the power required to hoist a load up an inclined plane, the first thing is the load on the engine. In an inclined shaft, 200 feet long and with a vertical depth of 150 feet, multiply the weight of ore, car and rope in pounds by the depth of the shaft in feet and divide by the length; weight 2000 pounds; $2000 \times 150 = 300,000 \div 200 = 1500$ pounds, the weight on the engine. The horse power is found by multiplying the weight in pounds by the speed of hoisting in feet per minute and dividing by 33,000. If the load is lifted at 200 feet per minute in the example, $1500 \times 200 = 300,000 \div 33,000 = 9.1$ H. P. To allow for friction, etc., add one-third, making 12 H. P.

STEEL is not made directly from pig iron, it being found impracticable. In what is known as the cementation process bars of wrought iron are heated for several days in contact with charcoal powder, during which time the iron absorbs a quantity of carbon, but as this product is of unequal composition and structure, the bars are melted in crucibles and cast into ingots. These ingots are heated and rolled, which renders the steel fine-grained and tough. By the Bessemer process mol-

ten cast iron is run into a large receptacle lined with a mixture of quartz, sand and clay (converter). A powerful air blast is blown into the molten mass through holes in the bottom of the converter. This results in a rapid burning out of silicon, carbon, and other impurities, leaving nearly pure iron. The bessemerizing process is also employed in treating copper matte as it is drawn from the smelters. It results in burning out a large percentage of the sulphur present in the matte, leaving what is known commercially as blister copper, containing about 95% to 98% copper.

FROM England comes the best of fluorite specimens. These specimens are taken from lead mines of Derbyshire and Cumberland, where it is the gangue of the ore. Many of the specimens are crystallized, and come in amethyst shade, in blue, in green, in yellow, in brown and white, and rarely in rose or crimson red. The crystals are in cubes similar in shape to galena cubes of Joplin, Mo., and a number of these cubes attached to matrix make splendid specimens. Fluorite minerals are found in the United States—in Kentucky, Arizona and southern Illinois—but mostly there in massive form, though crystallized specimens in white, blue, yellow and green have been found. These, however, are much less transparent than the English ones and do not make pretty specimens. The finest crystals of fluorite ever found in the United States were found some years ago in an abandoned lead mine in St. Lawrence county, N. Y., the crystals being a beautiful green and over a foot in size each way, the finest of these specimens being exhibited in the Museum of Natural History, New York.

TO TEMPER A TAP, after the tap has been cut and finished take it in a pair of tongs and heat it to a blood-red heat over a charcoal fire or the blue flame of a Bunsen burner or blowpipe, turning it around so that one point does not get heated before another. Have ready a pail of clean, cold water, into which a handful of common salt has been put. Stir the water in the pail so that a whirlpool is set up. Then plunge the tap, point first and vertically, into the vortex to cool. The turning of the tap during heating, as well as the swirl of the quenching water, prevents distortion. In tempering, the temper of the tap requires to be drawn to a light-straw color, and this may be done as follows: Get a piece of cast iron tube about 3 inches in diameter and heat it to a dull-red heat for about 4 inches of its length. Then hold the tap, with the tongs, up the center of the tube, meanwhile turning the tap around until the straw color appears all over it. Then dip the tap in the water, when it will be found perfectly hard. The depth of the color, whether light or dark straw, must be determined by the nature of the cast steel being used, which can be gained only from experience of the steel.

THE various forms of copper furnace products are known by numerous names, descriptive of the form or condition in which they occur. Thus, the first fusion of copper sulphide as it comes from the furnace is called matte—it may contain less than 10% copper or it may contain over 50%, though usually less in the first smelting. It is customary to resmelt matte two or three times, each resmelting increasing the percentage of copper, the last time it is "blown up" in the converters to "blister" copper, which may contain 90% or more of metallic copper. "Blue metal" is a name given to matte containing 60% to 65% copper; "white metal" contains 70% to 75% copper; "pimple metal" is matte running 80% to 85% copper, and "black copper" is metallic copper containing 1% to 5% sulphur. In the Lake Superior copper region copper is known by various names, which describe the condition in which it occurs. "Mass copper" is the name given large masses of the metal; "barrel work" is copper in small masses which has been cleared of adhering pieces of the gangue; stamp rock is rock containing finely disseminated copper that can be recovered by stamping and concentration.

OAK BARK, POTATOES, DEXTRIN, STARCH AND ANIMAL FATS have been used as a preventive of boiler scale. Remedies for carbonate of lime scale is heating of the feed water or addition of caustic soda or carbonate of soda. Petroleum oil and refined oil have also been recommended as preventives of scale. The use of caustic soda should be attempted with care, as it burns the flesh upon contact. Caustic soda if used in excess also causes violent foaming. The carbonate of soda is preferred. Among the substances recognized as detrimental, and the use of which has largely been discontinued in boilers, are slippery elm, ground bones, horns and hoofs, potatoes, starch, dextrin, animal fats and animal or vegetable oils. When using refined petroleum oil, no large amount should be introduced to the boiler at one time. When hard scale has already formed in a boiler, an effective treatment is found in giving it a coating of kerosene oil, to rot it. The oil may be applied with a brush or spray. An easier method is to fill the boiler with water above the scale line, introduce the kerosene, and then open a small cock, allowing the water to slowly run out. This gives the oil a chance to reach the scale as the water subsides, evenly coating the whole interior surface. This rots the scale, and it may then be removed by scraping or by blowing out the boiler. Still another way to remove lime scale is by introducing a quantity of caustic soda—40 to 50 pounds in a large boiler and then adding water, boil at atmospheric pressure for several hours (with the safety valve open). This softens the scale and it may be scraped out. Then wash out the boiler with clean water.

Ore Deposition and Vein Enrichment by Ascending Hot Waters.*

Written by WALTER HARVEY WEED, Washington, D. C.

The enrichment of mineral veins as a result of the migration of material from an upper oxidized or disintegrated part of a vein to a lower level, where it is redeposited, is now generally accepted as one explanation of the occurrence of bonanzas in gold and silver veins, as well as that of hodies of high-grade ores in cupriferous deposits.

My studies of the copper veins of Butte, Mont., show: That the veins there are of several ages and systems; that the older primary quartz pyrite veins were reopened by later movements, correlated with a period of volcanic activity, and that they were penetrated by hot alkaline waters carrying copper and arsenic in solution, which was deposited presumably by reaction with the pyrite of the original vein.

The enormous development of the Butte deposits, attendant upon the extraction of nearly 10,000 tons of ore a day, has revealed many facts concerning the nature and distribution of the ores. Enargite, the copper sulpharsenide, formerly a relatively rare mineral, is now found to be the chief ore of some veins and to constitute a large part of the high-grade ore of the eastern properties. Its distribution is peculiar, and its significance can only be understood as a result of detailed study; but several facts stand out prominently, viz.: It occurs in immense ore hodies, connected with faults, extending from the oxidation zone to unknown depths in some veins. But, in most cases, it first appears in deep-level workings. This ore was recently found in the 2000-foot and 2200-foot level of several mines; it is clearly older than the pyritic ores, but younger than the great glance ore hodies, and is formed in small quantity in later fault veins.

In the discussion of the genesis of the Butte deposits with the late Clarence King, he at first combated the principle of secondary enrichment, and adduced the presence of enargite as a conclusive argument against it. The later discovery of masses of hrecciated enargite cemented by glance proves the enargite to be of earlier formation; and though the pyrite is the only possible source of the copper and arsenic in the original vein, numerous assays showed almost total absence of arsenic from these ores. In brief, all the evidence showed that enargite, though not a "primary" vein mineral of the original vein, did not come from descending solutions, but must have come from below.

The bonanza ore of Neihart, Mont., has been described by me as an example of secondary enrichment by descending waters. In the light of a ripe experience and the experimental work of Dr. Stokes, it appears possible that the pearcite (arsenical polybasite) ores result from uprising alkaline solutions, though later descending solutions, carrying material derived from the oxidation of the ores, has taken place and complicated the situation. At any rate, it is difficult to account for the large amounts of arsenic necessary for the formation of these ores by the oxidation of very large amounts of primary pyrite almost devoid of it, while the occurrence of arsenic in hot-spring waters is known at La Bourhoulle, France, and the Yellowstone Park.

Recent experiments made in the U. S. Geological Survey laboratory by Dr. H. N. Stokes show that metallic sulphides are reduced and precipitated from alkaline solutions of the general character of hot-spring waters by pyrite. The metallic substances may be assumed to be present as oxides of zinc, copper, lead, etc. The reaction with the alkaline waters alone is represented by the equation:

In the presence of a metallic oxide reacting with Na_2S , e.g., ZnO , PbO , etc., the equilibrium will not be reached short of total decomposition of FeS_2 , and we get

These are the only products present, and the reaction is complete with excess of ZnCO_3 . The formation of Fe_2O_3 by action of a metallic salt on FeS_2 is new, as is also the formation of thiosulphate. The latter was proved beyond question by qualitative and quantitative methods, and there is no evidence of the formation of sulphites. Pyrite and marcasite, with CuO in bicarbonate solution, react as follows:

Experiments with both pyrite and marcasite at 200° C. show that the theoretical amount of sulphuric acid is actually formed.

That such waters actually occur in nature is not absolutely known. The Yellowstone Park waters are, however, nearly of this character, and in several springs at the Norris Geyser Basin are actually depositing the red and yellow sulphide of arsenic, and in one case auriferous pyrite. The Boulder hot

springs, where mineral veins are now in process of formation, in which small amounts of copper, gold and silver are deposited, are dilute solutions of alkaline waters.

From my study of the waters and veins of the last-named locality, I am led to the following theory of primary ore deposition:

Recent researches have demonstrated that openings can not exist in the rocks which compose the outer crust of the earth at depths of 30,000 feet or more, and that, indeed, under certain conditions, they can not exist at depths very much less than that. Observations made upon deeply buried rocks, brought to the surface by uplift and erosion, are in perfect accord with these deductions and prove that the "unknown depths" from which ore deposits in waters are derived can not exceed these figures. Assuming this to be true, it will probably be admitted (since heat and pressure facilitate solution) that hot waters circulating at considerable depths will dissolve and take into solution the various materials with which they come in contact. The capacity of hot water to contain such substances in solution will depend upon heat and pressure. The water will take up the less readily soluble salts only while the conditions are favorable. With less heat and pressure the solution may become saturated for any one substance and, though still holding it in solution, be incapable of taking up any more of that substance. In this unstable condition a slightly lessened temperature and heat would bring about precipitation.

In an ideal hot spring, the circulating waters slowly traversing heated, but solid, igneous rocks, out of which they dissolve various substances, fly toward the point of easiest escape, which is the hot spring fissure. For convenience, we will assume this fissure to be straight, 1000 feet to 2000 feet deep, and the waters to move upward very slowly. In its lower part, as in the pores of the adjacent rocks, heat and pressure are very great and the waters are not saturated, even for the most insoluble substances, and no minerals are deposited. Nearer the surface diminished heat and pressure make the water incapable of taking more of the less soluble materials in solution, forming what may be conveniently called the zone of saturation. Some salts, like alkaline sulphates, etc., are extremely soluble, and the point of saturation is scarcely ever reached in nature, even at the earth's surface. Others, like silica, may be present in such amount as to saturate the water; but the solution is clear, until cooling and relief of pressure cause supersaturation and precipitation occurs; an example of this was seen at the Opal and the Coral Springs of the Norris Geyser Basin, in the Yellowstone Park. Still higher in the hypothetical hot spring pipe, diminished heat and pressure cause the separation of the less soluble constituents, and for such materials this part of the tube is the zone of precipitation. It is well known that the metallic sulphides are soluble in alkaline solutions under heat and pressure; but examples showing their deposition by living hot springs are extremely rare. The more soluble substances will be carried farther upward before precipitation, and one might even suppose, if the solubilities of the substances were sufficiently unlike, that zones would be formed, each one of which consisting mainly of the particular substance thrown out by the change of pressure. This would produce an orderly distribution of the ores in a vertical direction. This, indeed, has been observed frequently. Chamberlin records it for the lead and zinc deposits of Wisconsin, and Rickard for those of Colorado and elsewhere. In the writer's own experience, the order appears to be galena on top, passing into highly zinciferous ores below, and this into low-grade pyrite. It is a common experience to find this association in silver-lead deposits in limestone. This would account, also, for impoverishment in depth and the passing into the ever-present and readily deposited silica.

The conditions in a hot spring tube are admittedly those postulated, i. e., lessening heat and pressure as the surface is approached; the assumptions made are natural ones. This, then, would explain why hot springs do not deposit metallic sulphides at the earth's surface. Owing to their relative insolubility, they are deposited—if present in the water—at depths below the surface. The Sulphur Bank quicksilver mines of California are examples. At the surface they showed only sulphur and no quicksilver. In depth quicksilver ores appeared. Were these springs to die out and degradation to remove the upper 200 feet of the ground, quicksilver veins would be exposed. It is probable that somewhat analogous conditions may exist at many hot spring localities, and that if we could expose the lower part of the conduit we should find ore deposits. This is the theory which the writer at present holds as to the genesis of the silver-gold veins of Lump Gulch and other mining districts of Jefferson county, Mont., and which he believes is a rational ascension theory. All secondary alterations are here excluded, these remarks applying only to the primary vein filling. It is lateral secretion only in the very special and limited application of that term to the leaching of relatively deep seated rocks and the gathering of such waters in a hot spring conduit.

The close resemblance in nature and occurrence of these Boulder hot spring veins to the jasper reefs of Clancy, Lump Gulch and many other mining districts

in the granite area of Jefferson county, Mont., has already been stated. It may be accepted as certain that they also owe their origin to hot springs, and that the ore deposits of such veins were formed by hot waters.

Applying these conclusions to the question of vein enrichments, it is first necessary to recall that bonanzas and rich ore shoots are very frequently associated with hrecciation and recementation of the vein filling. Where the evidence precludes "secondary" enrichment from above, the possibility of enrichment by a new or renewed supply of hot water coming up the newly-formed fracture must be considered. The successive reopening of veins was formerly an accepted explanation of an orderly sequence of mineral crusts, implying a repeated uniform reopening. Such exceptional cases may occur, but it is certain that many veins occupy fissures that are lines of weakness in successive periods of earth movement. Even in the deposits still forming at Boulder Hot Springs, Mont., the veins have been fractured and the fragments cemented by newly deposited silica. At Butte and Neihart the veins have been broken by post-mineral fractures with later deposition of rich ores. The evidence at Butte—furnished by rock walls, deposited ore and structural conditions—shows that the primary quartz pyrite veins were broken by fissures that became the conduit for ascending hot alkaline waters. Such waters would tend to deposit any burden of metallic salts in zones as already outlined; they would, also, be influenced by the existence of the crushed pyrite of earlier deposition, which is an energetic reducing agent.

CONCLUSIONS.—Ascending hot spring waters, if metalliferous, may deposit different ores with an orderly vertical distribution. Existing veins now mined often show this arrangement of metallic sulphides.

Ascending hot alkaline waters coming up through crushed and reopened veins containing pyrite, or marcasite, react with this sulphide, and zinc, lead, copper or silver, if present, are thrown down as sulphides.

Ascending hot acid waters may leach the lower levels of reopened veins and deposit gold, silver and copper upon cooling at higher levels.

Coal Industry in British Columbia.

United States Consul A. S. Smith at Victoria, B. C., says of the coal industry of British Columbia as follows:

The Vancouver Island mines are better developed than ever in the history of the Province of British Columbia. During 1902 coal was mined to a larger extent than ever before, notwithstanding the competition with the fuel oil of California. About 1,731,000 tons of coal were mined in the Province during 1902, and about 200,000 tons of that amount were converted into coke, making 127,800 tons of this latter product.

There has been an important discovery of anthracite coal 4 miles from Cumberland, near the celebrated Comox mines. The deposit is found to be extensive, the same vein cropping out in places 2 or 3 miles apart. None has been brought to market, but sixty men are employed in developing it and a railway is in process of construction thereto. The anthracite is of excellent quality, shows an analysis of 80.7 in carbon, and is practically smokeless. The Wellington Colliery Co., which owns the ground, expects to have the coal on the market by next fall.

The Extension mines, 10 miles south of Nanaimo, owned by the Wellington Colliery Co., have been closed since the middle of March. The cause is not any question of wages. In March a meeting of the employees was held to consider the question of asking for increased wages, when, at the instance of a representative of the Western Federation of Miners, a large majority of the men present voted to form a union and to make it a branch of the Western Federation. As soon as news of this action reached James Dunsmuir, the president of the Wellington Colliery Co., he directed that a notice be placed all through the vicinity that the mines would be closed April 1, 1903. The men responded on March 10 by voting to quit work at once. Since then not a ton of coal has been produced in this great mine. The men insist on their right to join any union they choose, and the directors of the Wellington Colliery Co. maintain that while they have no objection to the men forming a union among themselves, they will not employ men who belong to an international organization and are subject to the orders of men living outside of Canada. The result is that 1000 miners have since been idle, and the town of Ladysmith is rapidly becoming depopulated. Large numbers of miners have left the island and have obtained work in the Crow's Nest, or Washington mines. The president of the colliery company, in a published interview, insists that he has spent millions of dollars in the development of his mines and will not submit to any interference by outside labor organizations, but will rather close his mines for ten years.

Up to date, therefore, the expected extension of coal export to San Francisco, owing to the suspension of the United States duty on coal, has been effectually checked. Indeed, a coal famine in this city has been prevented only by the importation of

*Trans. Am. Inst. Min. Engs. (condensed).

coal from Washington, and the price has been raised from \$6 to \$6.50 per ton for household use.

The acuteness of the situation here has been brought to the notice of the Dominion authorities at Ottawa, and a labor commission appointed to investigate the same. It will next month commence to receive evidence in Victoria and other points in the Province, but there is no promise of either side agreeing to accept the findings.

Beach Mining with a Surf Washer.

Written for the MINING AND SCIENTIFIC PRESS by
A. E. ELFNER.

The action of the waves may be utilized for washing the auriferous sands and gravel of an ocean beach in a very simple manner. The process is quite similar to ordinary sluicing. A shallow riffle box, 8 or 10 feet long by 3 or 4 feet wide, is set in the surf and weighted down with houlders or sand bags. The "pay dirt" is either shoveled in, if it is within shoveling distance, or brought to it in wheelbarrows and dumped in the center. As the waves run through this box, they spread the dirt and wash it out, leaving the gold in the riffles.

This device has been called a surf washer, and the accompanying sketch gives an idea of its general appearance. Both ends are open; the sides are raised only about 2 or 3 inches above the riffles, which latter are divided into sections for convenience in cleaning up. The cross-piece under one end is to be loaded down with weights to steady the washer in the surf, and the raised platform at the other end is for the same purpose. The surf washer must be so placed on the beach that the waves will run well through it,

A Surf Washer for Beach Sands.

and then recede completely out of it, and it must be pulled up, or down the slope of the beach with the tide.

Some beaches have a good natural grade, permitting the use of an even bottom on the surf washer, but on a flat beach it may become necessary to give the washer itself some slope to get a working grade, especially if very fine sands are to be worked. The usual sluicing grade, from 8 to 10 inches to the box length (12 feet), seems to be about right. It is well to use quicksilver in the riffles. In some cases it might be advisable to use plates also.

The amount of work this device will do varies with the force of the waves. On calm days it requires very slow feeding, while with a medium strong surf it will take two good shovelers to keep the riffles filled up. Its most logical use is in working that part of a beach which lies between low and high tide points, and which cannot well be sluiced, because sufficient grade for a string of boxes cannot be obtained without setting the boxes in the surf, where it would be extremely difficult, if not entirely impossible, to support them against the shock of the waves. The necessity for overcoming this difficulty brought about the invention of the surf washer, credit for which invention is due to E. Mulgrew, an old-time Alaskan prospector, who built the first one at Topkuk, on Bering sea.

When I came to that place in the summer of 1900, the ground had been worked over two or three times and was considered about worked out. Several parties were sluicing—pumping sea water for the purpose—but most of the men used rockers and grizzlies. Nobody seemed to make much more than wages, especially not the men with rockers, who could hardly earn enough to keep them in grub. I used a rocker,

myself, for a few days, and found that it did not pay. Then I thought I would give Mulgrew's invention a trial. I copied his idea on a small scale, building a washer about 2x6 feet, and made a six-hours' trial run on the black sand at the edge of the water. I cleaned up \$25, and as long as I continued to use the surf washer I never failed to get at least \$1 per hour for my work, while on an average I made considerably more.

Although this is eminently a poor man's device, being easily constructed and inexpensive, I see no reason why it could not be applied on any scale desired. By anchoring a buoy and pulley a little distance from shore and using a horse or some other power for pulling, the surf washer could be enlarged and its capacity increased accordingly. Any number of washers could be set side by side on the beach, and they could be fed by means of wheelbarrows, scrapers, or some sort of conveyor wherever the material to be treated is too far away to be shoveled directly into the washers. The money otherwise expended in pumping water for sluicing, or in ditching, can be applied to the economical handling of the ground.

Some Notes on Iridium.

Iridium occurs both as native iridium and as a constituent of the natural alloys, osmiridium and platiniridium. That which is found associated with placer gold from California and Alaska is recovered by the United States Mint at San Francisco, Cal., in the following manner: Being insoluble in sulphuric acid the iridium remains with the gold sponge in the bullion refining process. On melting the sponge the

iridium crystals settle to the bottom of the pot. The gold is poured into bars with the exception of a small portion in the bottom, which is allowed to cool in the pot. This hutton, or "king," is saved from each melt during the year, and at the annual cleanup in June they are all melted down, collecting the iridium in a single "king." These huttons are sold to pen manufacturers and the gold dissolved out by aqua regia. If much platinum is combined with the iridium, the alloy is dissolved by aqua regia, but osmiridium remains unaffected. On account of its extreme hardness, infusibility and indifference to reagents, osmiridium is used for pointing gold pens, for watch and compass bearings, and iridium itself for knife edges of delicate balances. Because of its occurring in very small grains, 3000 to 6000 in one ounce, but a small proportion of the native osmiridium is available for use by the pen makers (about 10%). Those crystals that are large enough to begin with sometimes break on being worked, due to their laminated structure. When a suitable grain is selected the procedure is: Attach to pen with silver solder; cut it through with a revolving copper-plate tipped with diamond dust, forming two halves of nih; then with oil and emery on another revolving copper-plate, grind to shape. The annual consumption in the United States of osmiridium for pen points is about thirty ounces. Katharinenburg in the Ural mountains, Russia, is the principal source, the annual production averaging 200 ounces. However, as the California mineral contains less platinum, it is denser, heavier and harder, hence more desirable. Pure iridium has a specific gravity of 22.42 and fuses at 1950° C. It is worth \$1.07 per gram, but in grains 50 cents per gram.

Mining in Bendigo.*

Written by L. A. SAMUELS.

In practical mining in Bendigo, the quartz mining center of Victoria, which recently celebrated its fiftieth anniversary of gold mining, Bendigo has not lagged behind other Australian mining districts in the evolution of mining from its crude state.

The mining managers are, without exception, practical miners. Many of these, perceiving the advantages and actual necessity of acquiring such knowledge as no amount of practical experience can supply, and which a progressive age renders absolutely necessary in pursuit of mining as well as in other callings, necessitating the use of the most complex machinery, scientific appliances and instruments, the metallurgical treatment of ore, concentration, as well as an acquaintance with various branches of exact and abstract science, have availed themselves of the opportunity afforded them in the Bendigo School of Mines, to acquire such knowledge, and thus combine the necessary theoretical with the practical education and experience which they have received as workers in the mines. The Bendigo mines, owing to their peculiar reef formations, so dissimilar to those in other localities, exhibit particular problems and difficulties. Owing to these peculiarities, shaft sinking, and, of later years, deep winze sinking, has been one of the main features of practical mine work in this mining district.

The peculiar so-called saddle formations of its quartz reefs have been often described. The formations are generally of considerable length, with comparatively little lateral expansion and depth. They are found below each other with very indefinite distances between them, and the anticlinal axis of the strata, where the cap of each formation is situated, dips, at an angle of 9° to 10° from the perpendicular, to the east.

Hence, shaft sinking always becomes a necessity when it is desired that new formations should be located. As, however, on account of the dip of the anticline, or, as it is locally termed, center country, to the east, it is generally required that crosscuts of considerable length be put in towards center country, from the deep shafts, and as these crosscuts, except when they are put in at very short intervals, are very apt to miss the intersection of a formation, the practice has been adopted of sinking winzes from the lowest working, starting slightly east of center country and, near as possible, hugging the anticlinal apex, even where the winze reaches a depth approaching 500 feet. The size of such a winze is seldom larger than 7x3 feet clear. It is closely timbered and divided into two compartments. One is for winding, and large enough to have room for a large kibble, bucket, or small cage. The other is used as a ladder road, and sometimes also for pumps, air pipes, etc., and also answers the purpose of ventilation. In the chamber or plat which has been constructed at the mouth of the winze, a 6-inch double cylinder air winch is placed in position. Now, if the distance to be sunk before a new formation is reached should not be very great, the same will be intersected in the winze, at or near the apex of the reef. Should the winze, however, be required to be sunk a considerable depth before meeting with a new formation, center country will pass away to the east, and short crosscuts in that direction will have to be put in, and by this means the positions of deeper formations are ascertained.

But apart from the primary purposes for which a winze of this description is sunk, it has a further advantage of much importance, by being of great service in the ventilation of the future lower workings when newly discovered formation is being operated and the bottom of the winze is connected with the main shaft, which has now to be deepened in order to attain that depth which the winze has already reached.

Shafts are already sunk to depths approaching 4000 feet, and workings at 3000 feet and below that depth are common. It may safely be said that without the aid of machine drills, air compressors, and other modern appliances, this would have been impossible. Furthermore, by these means, and the greater experience and intelligence brought to bear upon the matter of shaft sinking by the managers, their foremen and miners, it is a positive fact that sinking now at 3000 feet is less than it was formerly at a depth of 300 feet, while wages have remained practically the same.

To some extent, the lesser quantity of water encountered in the greater depth has also lessened the cost of sinking, and, in most cases, in deep shafts, pumps have been discarded and the water is being raised by means of haling.

With regard to the cost and mode of sinking, the writer is in a position to give reliable data, as a few years ago it was decided to sink a new main shaft in one of the mines under his management, 1000 feet, straight from the surface.

The size of main shafts in this district is generally 10x4 feet, or 4 feet 6 inches, in the clear of timber, divided into two winding compartments of 4x2 feet

* Trans. Aust. Inst. Min. Engrs. condensed.

10 inches, and one pump and ladder compartment of 4x4 feet. The two dividing walls of 2-inch timber make up the difference of 4 inches in length of shaft. In this case, this ordinary rule was not departed from, although an increase in length by 2 feet—making the total length 12 feet—is advisable.

Very large shafts are not such a necessity here as they are in other places, as the winding compartments of the size mentioned are quite ample for the required haulage, but the greater length mentioned affords more convenience in the pump and ladder compartment, which has to be utilized as a hauling compartment with air winch while sinking, and hauling water and mullock to the lowest plat from where it is then raised direct to the surface.

The sinking of this new shaft was commenced from surface in the month of September, 1897, and early in January, 1898, a depth of 400 feet was reached, the country passed through being of the ordinary description and may be classified as fairly hard and very hard sandstones and slates. It must be mentioned that, to a depth of 600 feet, the sinking was dry, as, to that depth the water was taken away by means of pumps from the adjoining shaft from which a crosscut passed nearly under the site of the new shaft at 600 feet. This depth was reached in the following March.

The site of the shaft having been selected to meet a deep center-country winze 250 feet in depth, from the just mentioned 600-foot crosscut, when this winze was reached, it afforded, of course, some assistance in sinking the next 250 feet, but a heavy body of water had now to be contended with and hard sandstone strata became predominant.

Sinking was, however, finished in the month of August, 1898, at a depth of 980 feet, in about eleven months from starting, during which time five plats had also been cut, viz., at 200, 400, 600, 720 and 900 feet from surface.

In sinking the shaft a bonus system acted as a strong incentive to the shaftsmen to push on the work. It had been arranged that, besides their ordinary wages, a bonus of £1 per foot should be divided pro rata among those men working in the bottom, for every foot sunk and timbered over 40 feet per fortnight. By this means the men's wages were sometimes very materially augmented, they being able to divide sometimes £5, £10 and as much as £15 among themselves.

(TO BE CONTINUED.)

Copper River District, Alaska.*

Written by A. C. SPENCER.

The Chugach and Wrangell mountains are drained principally by the tributaries of the Copper river. The former as a range is made up of mountains which have been carved by the numerous streams of the region from a portion of the earth's crust which formerly existed as a high plateau. The Wrangell mountains have originated essentially through the upbuilding of volcanic materials on a surface which is the extension of the Chugach plateau. Volcanic activity has been continuous in this group from the time of its inception, probably in the Miocene, down to the most recent time.

The Chugach plateau is considered to have originated in the uplift of a base-leveled land surface, and from the fact that this feature of erosion has been found to bevel the edges of folded and upturned lower Cretaceous strata its age is considered to be late Mesozoic or Tertiary. It is, however, impossible to fix the date more closely than between these limits. At the close of this long-continued erosion period the whole region had been so completely reduced that all topographic evidences of any dynamic revolutions of Mesozoic date were completely effaced. There could have been no elevations worthy of the name of mountains; no greater eminences than low hills existed to break the monotony of the extensive rolling plains. The upraising of the region was accomplished in several stages, but the intervening pauses were of very short duration when compared with the earlier period of base leveling.

Two paragraphs adapted from the report upon the Copper River district by Schrader & Spencer will indicate the character of the physiography of the Chugach mountains: (See illustration on front page.)

"The Chugach mountains occupy a coastal belt connected with the mountains of the Saint Elias range toward the east and with Kenai peninsula toward the west. The width of this belt is about 60 miles, and the mountain summits reach an elevation varying between 5000 and 7000 feet, though usually grouped about the elevation of 6000 feet, while above this occasional peaks rise to perhaps 8000 feet. To one who crosses the range by way of the valleys and low passes this general uniformity of level is not apparent, but from any considerable elevation within the region the impression is strikingly presented that the summits of the Chugach mountains represent the surface of an ancient plateau from which the mountain masses had been carved.

"The plateau character is well seen from the foothills of Mount Blackburn, in the Wrangell group.

* Extract from Bulletin of Geological Society of America.

The level crest line is a very striking feature to the eye, for at a distance of 25 or 30 miles the details of the dissection which the plateau has suffered since its uplift are lost, and only the uplift is noted. On a clear day the snow-covered peaks in the vicinity of Mount Saint Elias may be plainly distinguished, rising high above the general level of the plateau."

The tributaries of the Copper river, ramifying over an area of approximately 25,000 square miles, take practically all of the drainage of the Chugach and Wrangell mountains. This extensive drainage system is believed to have been developed during the erosion of the Chugach peneplain, and to have persisted with all of its major characteristics, by means of the active downcutting of stream channels continued pace by pace with regional uplift.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 26, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MEANS FOR TREATING ORES.—No. 728,908; F. D. Gross, Denver, Colo.

In treating ores, combination means for carrying ores, series rods carrying rabbling blades inclined relatively to path of movement of ore, part of rods being fixed, and remainder rotatable, rotatable rods provided with blades both sides inclined in same direction, means causing blades one side of rotatable rods to work in opposition to blades of fixed rods to rabble ore, means for causing blades on other side rotatable rods to work in concurrence with blades of fixed rods to discharge ore, and means simultaneously removing rabbling and discharging means from path of ore.

STAMP MILL.—No. 728,999; J. A. Shields and J. W. Shields, Lake Linden, Mich.

In stamp mill, and in combination with mortar, screen surrounding mortar, composed of sections or grates hinged at one edge and adapted to swing horizontally at opposite edge, means for securing sections at outer edges when closed.

BATTERY STAMP STEM GUIDE.—No. 729,169; J. H. Hendy, San Francisco, Cal.

Combination in stamp stem guide of box, chambered cap fitting thereto, bolts by which it is secured in place, cushion of felt or equivalent flexible mate-

rial, segmental spring having inturned ends adapted to hold felt and to curve it to fit stamp stem, supplemental spring supported and pressing upon back of spring-inclosed felt whereby it is maintained in contact with stamp stem.

ORE ROASTING FURNACE.—No. 729,170; J. B. F. Herreshoff, New York, N. Y.

Roasting furnace having superposed shelves apertured for passage of ore, and means for crowding ore toward apertures of shelves, in combination with spouts extending between shelves and adapted to direct ore on way from one shelf to next shelf below in such manner as to protect ore from influence of draft.

BLAST FURNACE HEARTH.—No. 729,105; M. M. Suppes, Elyria, O.

In blast furnace hearth, jacket plate or section having tap hole and integral trough or spout surrounding hole, and refractory lining for trough such depth and thickness as to extend considerably below and laterally of edges of hole.

APPARATUS FOR MAKING SULPHURIC ACID.—No. 728,914; N. L. Heinz, Lasalle, Ill.

In apparatus of class described Glover tower, acid chamber, and flues for conducting gases from tower to chamber, flues being arranged enter chamber near front end from opposite sides, at different levels and transversely to length of system whereby gases passing through flues into chamber caused enter in opposite directions, at different levels, and transversely to general course through chamber.

PROCESS OF ROASTING ORES.—No. 729,009; H. M. Sutton, W. L. Steele and E. G. Steele, Dallas, Tex.

Process roasting ores consisting in suspending particles in moving body air and subjecting them to heat and rotary motion to precipitate ore during expansion of air, collecting ore in moving body of cooler air, and separating ore from cooler air.

PROCESS OF CHLORINATING AND BROMINATING ORES.—No. 727,626; J. D. Hawkins and H. W. Fox, Colorado Springs, Colo.

Process of treating ores with halogen, consists bringing halogen hydrate into proximity to and raising temperature of hydrate to point sufficient to cause decomposition with evolution of halogen.

THE article on "Feeding Soapsuds to Air Compressors," with drawing, which appeared in the issue of May 9, was from Compressed Air, credit for which was inadvertently omitted.

Chain and Pick Coal Cutting Machines.

When machine coal mining was first completed the inventor's idea, in the designing of a machine, was naturally to imitate as nearly as possible the opera-

air, there never having been a successful electric puncher put on the market; whereas, the chain machine can be operated either by compressed air or electricity.

During the last few years the major portion of the coal mines that have been equipped with modern coal mining machinery have installed electric power

the mining machine, while about 30% would be an extremely high efficiency for an air mining plant where no reheaters are used.

Third—An extension of an electric feeder line may be made in a very few minutes by the machine runner himself, if necessary, while the laying of additional pipe for compressed air for the necessary extensions is, under the most favorable conditions, a good deal of an undertaking.

Fourth—The cost of maintaining a compressed air line is at least three times as great as an electric line. The acid water of mines is very severe on pipes, and after having once been put into a mine they can rarely ever be used again, and much loss and expense is incurred in maintaining pipe lines from leakage. On the contrary, with the copper circuits of the electric system there is scarcely any deterioration, and the wires can be readily removed and placed elsewhere in the mine when any portion of the mine may have been worked out even after such wires have been in use for a number of years.

The only objection which has ever been raised against electricity for mine use is the mistaken idea of danger of coming in contact with the wires. There have been some accidents in mines operated by electricity, but they are extremely rare.

In the Kanawah and New River districts of West Virginia, for example, there are at the present time about fifty mines equipped throughout with elec-

tricity, and there is yet to be the first accident recorded which can be traced to any contact with electric wires.

The advocates of compressed air claim that the air liberated from the compressed air engines in a mine assists in ventilation. This is so, but the assistance is slight.

The initial cost of a chain machine is from three to four times greater than that of a pick machine. On the other hand, it requires the same num-

ber of men to operate each type of machine, a runner and a helper, and the pick machine will undercut only about 40% as much coal as the chain machine. This fact has been recognized by the differential in

tion of the pick miner, consequently the pick or puncher machine, as it is commonly known, was the first type of mining machines tried. The defects of this form of machine soon became apparent, and the

rather than the compressed air. Still, of course, there are a number of mines using the compressed air chain-mining machines on account of their either having a very large installation of compressed air

patent offices of both England and America were flooded with applications for patents on coal mining machines. The final result of this vast volume of inventions and patents has been the development of the present coal cutter commonly known as the chain-breast machine, shown in Figs. 1 and 2. The pick, or puncher machine, had, however, been improved until it now does very satisfactory work under certain conditions.

The purpose of both types of machine is to undercut the coal so that it can be shot down ready for loading into mine cars, but the method of operation of the two types is entirely different.

In operating a pick machine the runner sits on a board or platform, inclined to the face of the coal; one foot of the operator is braced against one wheel of the machine, and with the two handles he directs it against the coal, picking off the coal exactly as a miner would do, except with much more force to each blow. The undercut made is V-shaped, 12 to 16 inches in height at the face, and tapering back to a feather edge on the floor at the rear of the cut, the depth of the cut being from 3 to 6 feet deep, according to the thickness of the coal. A helper shovels away the cuttings as the machine, guided by its operator, loosens the coal in the kerf.

The chain or breast machine is placed in position ready for the first cut at the extreme left of the room, the outer frame being held firmly in position by jacks extending to the roof. The runner then throws on his power and the machine makes an undercut 44 inches wide, 5 to 7 feet deep (dependent upon thickness of vein), and 4 inches high, in from three to four minutes. At the end of the cut the machine automatically is thrown out of gear and is reversed so that the sliding frame comes back to its original position. (See Fig. 3). The machine is barred across the face of the coal the width of the cutter head and the operation repeated until the entire room is undercut. A helper shovels away the cuttings as they are brought out by the cutting chain.

The pick machine can be driven only by compressed

First—Increased initial cost of installation as compared with electric equipment, it being about one-third greater for a small compressed air plant with the machines at no great distance from the compressor, and the proportion increasing very rapidly as the distance from power house increases.

Second—An electric plant can be installed with a guaranteed efficiency of 75% from the generator to

the miners' scale of wages against the pick machine, which is 2½ cents per ton.

In the face of the differential shown above, machine runners can always be more readily secured to operate the chain type of machine than the puncher, on account of their ability to make much more money with easier work.

The lump coal is the coal on which the operator

Fig. 1.—Electric Chain Mining Machine.

Fig. 2.—Air Chain Mining Machine.

Fig. 3.—Electric Chain Mining Machine With Frame Partly Under Coal.

now makes the most money, and consequently a machine which gives him the greater percentage of lump is the desirable machine. The pick machine making the same kind of an undercut that the miner does with hand pick, gives very little more lump coal than the miner himself, whereas the chain machine increases the proportion of lump from 10% to 30%, dependent upon the character of the coal.

It is much harder on a runner to operate a pick machine than a chain machine, as he is continually jarred by the action of the machine. The chain machine runner need not touch his machine after starting it until the cut is completed. It has been found much more difficult to educate a man in the proper handling of the pick machine than to operate a chain machine. With the pick machine a great deal of the result depends on the skill of the miner in directing the blows of the pick, while the chain machine, after once being set into position, does its work independent of any direction from the runner.

That there is a certain field for the pick machine, of course, cannot be contested. Where the coal is very thick and of a soft nature the pick machine does excellent work. It can undercut rapidly under these conditions, and the V-shaped cut is well adapted to let the coal come down, whereas in a mine having coal of this character there is danger of its settling down into the 4-inch kerf made by the chain machine and not rolling over when shot. In order to work a chain machine to the best advantage it is necessary to have a fairly good top, so that posts can be set 10 to 12 feet from the face, but should the roof require posts set very close to face, a pick machine can be used unless such posts are required very frequently along face.

One claim made by the advocates of the pick machine is that it can be used in all parts of every mine, so that it is not necessary to have any pick miners. In all mines where chain machines can be used to advantage, which covers practically eight out of every ten mines, the chain machine can be used in every part of the mining except in the drawing of pillars.

The objection raised to having any pick miners in the mine is that it demoralizes the general workings of the mine to have two systems and two rates of pay. Drawing pillars, however, is a very small part of mining, and is usually done by old and experienced miners, who consider it an "easy snap," as coal on the squeeze is always easy to mine; this claim, therefore, need hardly be considered.

In a recent report the chief mine inspector of Ohio says: "But while the machines depending upon electricity for power are becoming more popular and are more generally used, those operated by compressed air are becoming fewer. In 1899 the compressed air machines numbered 44; in 1898, 58; in 1897, 67; in 1896, 79; in 1895, 86, and in 1894, 112."

Gold Mining in Siberia.

A French mining engineer, who for some time past has been investigating the gold mining industry in Siberia, says: The principal reasons why foreign capitalists have hitherto paid so little attention to Siberian gold placers may be summed up as follows:

The extreme irregularity of the gold deposits, at one point being very rich and at another very poor.

The great difficulty experienced in working poor placers, because (a) hydraulic working is, except in rare cases, impossible in Siberia, on account of the lack of water and the want of high pressure, which seldom exceeds 50 to 60 yards, the gold deposits in Siberia being situated in large, flat valleys, with only small streams of water; (b) dredgers on pontoon bridges are very rarely possible for the same reason; (c) excavators and automatic cables produce an economy of only 30%; (d) underground work is restricted and very expensive.

The additional income from the sale of goods to workmen of Siberian companies, which is not permissible to a foreign company. The extravagant prices demanded for placers already washed over, which are therefore of small or of unknown value, and only to be determined by expensive works.

This last cause may in a year or two disappear, but the others will remain. It is, of course, possible that rich placers may be discovered which may prove to be profitable investments for foreign capital. The gold veins remain, which are more advantageously situated and will not be so soon exhausted. In these, the future of Siberia's gold mining will lie.

THE American Institute of Electrical Engineers will hold their next annual meeting at Niagara Falls June 29 to July 3, 1903. Among papers to be read at that convention are: "The Electrical Equipment of the Gold Dredge," by Ralph L. Montagu; "The Legalized Standard of Electro-motive Force," by H. S. Carhart; "Engineering English," by T. J. Johnston; etc.

Notes on Automatic Ore Sampling.

Written for the MINING AND SCIENTIFIC PRESS by
ALFRED HARVEY, E. M.

Automatic sampling is rapidly coming to the front, and automatic sampling machines of some sort are to be seen at up-to-date smelting plants and mills.

There are many sampling machines on the market. The two, however, which I believe are accepted as standard machines, and among the few which will sample correctly, are the Vezin and New Brunton

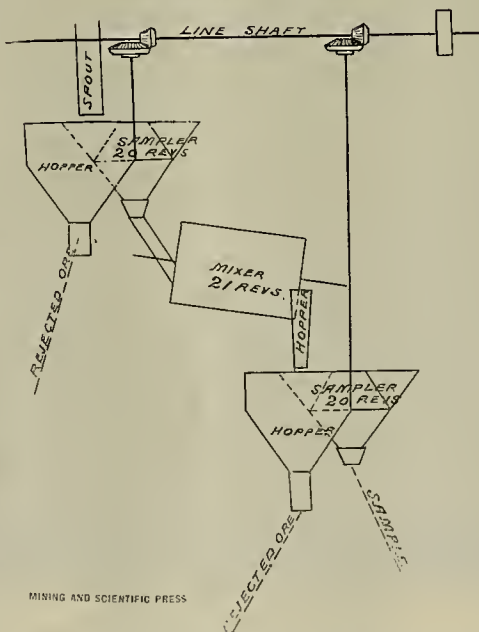

sample from any part of the stream continuously—it could not be a representative sample. But to cut out the whole of the stream at intervals of so many times per minute would be correct sampling from a common sense point of view.

Being far more familiar with the Vezin sampler, in its different forms, than with any other, and having worked a good deal with the late Henry A. Vezin, the inventor of the machine (a prominent mining engineer, and well grounded in the subjects of sampling and milling), I shall follow the workings of this machine, most of the information being given to me

SIDE ELEVATION.

END ELEVATION.

samplers. Both these cut out the whole of a stream of ore, at stated intervals of time, as a sample, in distinction to those machines which take part of the ore stream all the time.

The latter method I consider unsafe, for where coarse and fine ore are running together in a stream, as down an elevator shoot, the fine will work to the bottom. The lack of uniformity in values in coarse and fine ore from the same mine, which is so often the case, would make it extremely unsafe to take a

by him. The Vezin sampler is not patented, is of simple construction, and not expensive; is durable and easily cleaned. I give outlines of two machines, one suitable for 4-inch material and one for from 1 to 1½-inch material. The upper and lower cones of the sampler and the hopper are usually made of No. 10 steel, B. & S. W. G., and generally made cold. Where greater durability is required the scoops are made of ½-inch plate. The form of the upper portion prevents flying particles from getting into the

sample. It has been made, however, by special request, with this part cylindrical, so that the scoops could be easily put on and taken off. Each machine shown is arranged to cut out one-fifth—that is, two scoops of one-tenth each.

I have given two views in outline of two Vezin samplers, with intermediate cylindrical mixer, and hoppers in place. The samplers are of slightly different design, from those for coarse ore, and are arranged for sampling ore which has been crushed to pass about a 1/4-inch ring. The upper one cuts out one-fifth and discharges it into the mixer, which changes the intermittent into a continuous stream and then discharges the ore over a second sampler, which also cuts out one-fifth, making the sample one-twenty-fifth of the whole, the course of the ore in this instance being from the car onto a shaking screen. The screenings were conveyed directly to an elevator, the oversize through a 15x9-inch Blake crusher, thence to the same elevator. This elevator raised all the ore to a revolving screen. The screenings (say 1/4-inch) were discharged over the upper sampler, the oversize returned to 14x27-inch rolls, and after being crushed was raised by the elevator again to the revolving screen, and so on, until all the ore was sampled. The rejected ore from the samplers was conveyed to the bins.

In a 100-ton lot of ore this sample—one-twenty-

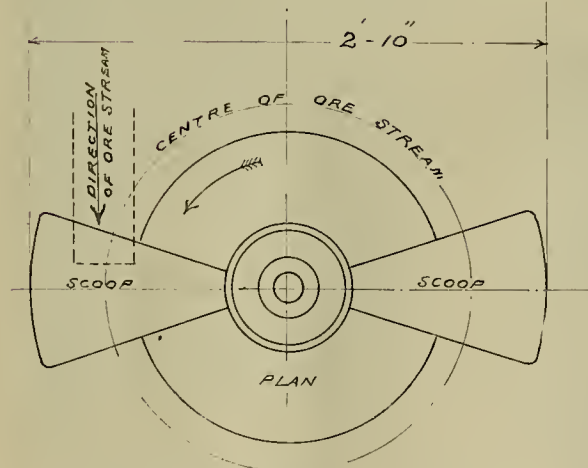

inclined (generally about 50°) so that the stream of ore comes to the samplers in the same direction as that in which the scoops are moving. These spouts should not be placed perpendicularly over the scoops.

The intermediate revolving mixer shown is 2 feet in diameter and 2 1/2 feet long, and provided inside with haffle plates, which are in a plane at right angles to the axis of the mixer. The irregular flow of ore (being the scoopfuls) received from the upper sampler is turned into a steady stream and passed on through the hopper to the second sampler. This arrangement is suitable for ore intended for milling purposes, but smelting works would require it coarser.

Phillip Argall, manager of the Metallic Extraction Co.'s works near Florence, Colo., found that remark-

Diam. of Largest Pieces—		Minimum weight of sample.
Mm.	Inches, approx	
1	1/16	1 ounce
2	1/8	1/2 pound
4	1/4	4 pounds
8	1/2	32 pounds
16	3/4	256 pounds
32	1 1/2	2,048 pounds
64	2 1/2	16,384 pounds

And so on, until for 5 1/2-inch pieces we have 79,000 pounds. These figures, as also a great deal of information herein contained, were given me by the late Mr. Vezin, whose long practice in automatic sampling makes them the more interesting. If the basis of this calculation (1 ounce) is larger than necessary, then all the other weights would be reduced in the same proportion.

VEZIN SAMPLER FOR
FROM 1" TO 1 1/2" MATERIAL.
HOPPER NOT SHOWN.

VEZIN SAMPLER FOR 4" MATERIAL
WITHOUT HOPPER.

fifth—would be 4 tons. This would be recrushed in small rolls and passed over the samplers again, thence to the riffles and the sample grinder. Samplers with two scoops cutting out one-sixteenth each (so that the sample would be much smaller) could be used. This would give 1/16 of 100 tons, which would be a little more than 1 1/2 tons. This would be passed through the 20x12-inch rolls, reducing it to 1/4 inch or less, and discharging it to the sampling floor below, where it would be further cut down by riffle samplers, the rejected ore conveyed to the storage bins, and the samples passed on to the sample grinders. With very low grade ore the 1 1/2 ton of ore might be put through the samplers again before recrushing.

The samplers in this arrangement make twenty revolutions per minute, and (with two scoops) a scoopful is taken about every one and one-half second. They are so placed that the ore stream passes just outside the upper cone. The plane of the center line of the ore current forms a tangent to the circle described by the center of the receiving part of the scoop. Hence there is no wear on any part except the scoop. The spouts leading to the samplers are

ably close results were obtained by automatic sampling with the Vezin sampler. Much of the ore received at these works would assay from \$200 to \$300 per ton. Check samples corresponded within .02 ounce, or say 40 cents per ton. The cost of sampling at the above works was stated to be \$0.12 per ton. It is also stated that in sampling 32,000 tons of Cripple Creek ores the scoops of the machine wore down 1/2 inch only.

I give two views of Vezin samplers, with shaking shoe as intermediate mixer, for coarse ore—3 inches. This was designed to suit special conditions and would not be adopted in purchasing coarse ore. The sample taken by the first or coarse sampler would be recrushed before passing over the second sampler, the amount being too small for the maximum size of the pieces. Very much depends, of course, on whether the ore is high or low grade, and also the evenness of distribution of values. If a sample that will pass a 20-mesh screen can with safety be cut down to 1 ounce avoirdupois, then the following weights would be the least that could be taken with safety, if the pieces are of sizes given, 20-mesh being about 1 mm.:

I think that in the sampling of a vein of ore, where cuts are made across the vein at specified distances, taking say 5 pounds of ore per foot, a carefully taken sample is often made worthless by quartering the sample in the mine before further comminution.

After coarse ore, such as is received at smelting works, has passed over the first or coarse sampler (say 3 or 4-inch material), which takes out one-fifth, one-eighth or one-tenth, as the case may be, or as much as is considered safe, it should be crushed finer before going over the second sampler. The material can be saved in a bin, and, where it is considered safe to take out one-tenth or one-fifth of the original ore, it can afterwards be crushed finer, then passed over two samplers with intermediate mixer.

The samplers for the coarse material are arranged with one scoop to take a scoopful every four seconds, the velocity of the falling ore being taken at 8 feet per second. The smaller sampler, for 1-inch material, takes a scoopful every two and one-fifth seconds.

In a properly designed and constructed automatic sampling mill results will check closely, and in concentrating and other mills, where it is desired to

know what saving is being made on the ore treated, automatic sampling where the ore is being received and at the tailings end will show not only the value of the ore entering the mill, but the value going away in the tailings.

Practice of Quartz Milling on the Rand, South Africa.*

Written by FRASER ALEXANDER.

I have been induced to bring these notes on quartz milling before you because I believe that the subject has not yet been touched upon, and, as the matter is of such importance to us all, I trust you will accept the same, not as a matter of instruction, but being a subject in which we are all interested, and therefore possessing some opinion thereon, as a means of eliciting views from those far more competent to speak authoritatively on the subject than myself on the various points involved in the operations of a quartz mill.

For this reason you will understand that I am able only to lightly touch upon the subject, for to describe in detail the construction of a mill alone would occupy more of your time than you would enjoy, and I need say no more to excuse the brevity of my notes.

The present quartz mill is the outcome of many years of experience, differing very considerably from that in use, say, ten years ago, with marked improvement; but, many as the improvements have been, I believe that there are still more to be made, and, if I should judge by the undoubted gain in knowledge of the cyanide process by the interchange of ideas between those working, that the same would apply to millmen, I have therefore no hesitation in appealing to them to "come out of their shells" and cast off prejudices, so that by open discussion some light may be let in upon what is still in their minds at least an obscure subject.

The reduction of our basket gold-bearing quartz on the Witwatersrand is done almost entirely by means of heavy stamp mills, copper-plate amalgamation and subsequent treatment with cyanide, as most of you are aware, and I will endeavor to briefly sketch what I believe to be the common practice in vogue on these fields.

The ore when hauled from the mine is dumped over grizzlies, separating the "fines"—which are sent direct to the mill—the coarse rock being elevated to a height sufficient to allow it to gravitate, first, through a rotating drum or screen, where the rock is washed, and then onto the sorting table, where the waste rock is picked out, the pay rock being automatically discharged into the rock breakers—of various patterns, Blake-Marsden's being in most common use—where it is broken to about 2-inch cubes before being delivered into the mill bins, which are of various capacities, in most cases holding sixty hours' run of the mill.

The cost of a modern heavy mill erected on the Rand, exclusive of power plant, is, roughly, £310 per stamp for 100 stamps. The indicated horse power required to work such a mill is 3 H. P. per stamp.

The amount of water required to wash the crushed product over the amalgamating table is about six times the weight of ore crushed when the ore is first washed and sorted; but if the mill pulp is classified by means of hydraulic classifiers, the amount required would be fully eight times the weight of ore crushed. Little or none of this large volume of water is wasted and in a well-equipped plant it can be returned to the mill for reuse within two hours after it first passed over the plates.

The weight of stamp apparently most suited for crushing our basket, which is not so hard as some quartz lodes—Sheba G. M. Co., at Barberton, for instance—is the heaviest yet tried, viz., 1250 pounds.

Now, having glossed over the mill as a mechanical contrivance, I will class the work under two headings:

1. Crushing.
2. Amalgamating.

Crushing the maximum quantity of ore to a determined degree of fineness is, undoubtedly, the first consideration of millmen on these fields.

The determination of screens to be used on each mine should be very carefully settled by experiment on the ore over a period covering, say, three months, during which time three thorough practical tests can be made with 1000, 800 and 600 mesh light screening (square inch).

The screens mostly in use on these fields are 700 holes to the square inch (light), and it is surprising to find a difference of fully half a ton duty per stamp per diem as a result of crushing under apparently equal conditions.

The weight of stamp, speed, length of drop, height of discharge and quantity of water appear to be the chief factors governing the crushing powers of a stamp mill through a given sized outlet.

A 1250-stamp, with 3½-inch stem, 16 feet long, with 20x9-inch bosshead, 12x9 inch shoes, will crush 5.5 tons per stamp per diem through a light screen of 1000 holes to the square inch, given a speed of ninety-five drops per minute, an 8-inch drop, a 6-inch discharge and six times the weight of water to ore crushed.

These figures are compiled from actual results obtained over a fairly long run on deep-level ore, and I quote these results in support of an exceptionally fine crushing on these fields with heavy stamps.

As I have before stated, the screens mostly in use on the fields are 700 light; the weight of stamps can be taken at 1050 pounds, and the average crushing, under practically identical conditions, as above, is 4.8 tons per stamp per diem; this apparently points to the heavy stamp being most efficient; but minor details in the practical working of a 100-stamp mill will, I feel sure, appeal to mill men as being of more than actual importance of weight alone.

Where 100 stamps are placed back to back, four white men and four natives are required on each shift to efficiently work the mill; if in one line, two whites and two natives can accomplish the proper care of sixty stamps.

The feed, which is automatic—Challenge feeders being invariably used—is of the greatest importance and should always be kept even, special care being taken that the stamp is crushing through the pulp in mortar box onto the die; if this is not carefully watched, the mortar box is liable to bank in one end and pounding will result, to the detriment of good crushing.

Speed and length of drop is of considerable importance, the first requiring an efficient power plant. I believe the maximum speed consistent with fair wear and tear to be reached in a 1250-pound mill, when ninety-five 8-inch drops are being registered, the enormous vibration consequent on an increased speed causing crystallization of both stem and cam shaft, without any appreciable gain in the rate of crushing.

The amount of drop is fixed by adjusting the tappet, allowing the cam to lift the stamps a certain height only, 8 inches being a common average. The tappets, being once set to allow the required drop, require constant care to keep each stamp working at its proper drop, and the shifting of one tappet in the set of five stamps will often very greatly retard crushing, not so much from defective crushing of this individual stamp, but through the irregular splash caused in the mortar box. When examining a battery in order to regulate the drop, first cut the feed as low as possible, which will allow a practiced hand to at once detect any variation in the drop of each set of stamps; it is often thought by workmen that, to save too often shifting of tappets, ½ inch will make no difference; but the reverse is assuredly the case. There is some divergence of opinion on the order of drop, some claiming 1, 3, 5, 2, 4; others 1, 4, 2, 5, 3, and again 1, 5, 2, 4, 3. The latter is, in my opinion, the best, causing the most regular splash and least waving, and, consequently, throwing out the crushed product through the screen more rapidly.

The use of chuckblocks for regulating the height of discharge has, I am sure, been thought out among mill men here, and should not exceed 6 inches where 1000 screens are in use, 5 inches for 800 and 4 inches to 5 inches for 600 or 700 screening. It is obvious that the escape of crushed particles of ore in the mortar box can not be too readily facilitated, for, on the other hand, hanking of material too coarse to immediately pass through the screen will certainly take place against the screen if the chuckblock is too low; the feed here plays a most important part and points to the height of discharge as being subservient to a close or full feed, the latter in all cases being decidedly objectionable to fast crushing.

It is here that I believe the sliming of ore takes place in excess of the actual slimes consistent with the peculiarity of our basket deposits, which, under reasonably favorable conditions, may be relied on to produce not less than 26% of slimes.

One case prominently illustrating my contention is that of two large mills crushing with 1000 and 700 screens, respectively, both making 30% of slimes; but, strange to say, the 700-mesh mill is producing nearly one ton of crushed material per stamp less than that produced by the 1000 screen, all conditions being practically equal. The screen is certainly a controlling but by no means a final factor in regulating fast crushing.

The water supply should in all cases be a constant one—that is, the head or pressure varying as little as possible—on these fields; about six times the weight of ore crushed is used in the mortar box, delivered through one or two pipes, arranged to discharge in some cases onto the feed chute and in others at the back of stamps into the mortar box; the first mentioned is found to give every satisfaction; the volume of water is indeed a large one, but as we have to face the question of pulverizing the ore to determine the degree of fineness, irrespective of the old-time methods of amalgamation, it matters little, so long as a rapid discharge of the crushed particles be ensured.

I do not wish to convey the idea, through above remarks, that our mills are being utilized merely as machines for crushing the ore. Far from it. They have always played a most important part in the production of gold and, I feel sure, will continue to do so for a very long time to come; but I certainly do think their first consideration is to crush the maximum amount consistent with fair wear and tear of the machinery, and in no way allow the time-worn practice of inside amalgamation to detract from the crushing abilities of the mill.

We now come to the important point, "amalgama-

tion," or should I embrace the wider term, "extraction of gold." I fear my convictions lead me to place copper-plate amalgamation as a very secondary extractor of the precious metal, and so will confine myself to the common practice of amalgamation as we find it carried out on these fields.

Large sheets of the purest copper obtainable should be used—12 feet long by ⅝ inch thick and 5 feet wide—this width more than covering the discharge from the mortar box. The plate, which is usually of one piece turned up about 2 inches on all sides except at the lower end, is securely fixed to a heavy wooden table by means of wooden laths screwed down on the outside of the turned-up portion and firmly bearing on the copper itself; the whole table can be easily removed in or out of position and should not bear or rest on the sills, king posts or foundations of the mill itself. Care must be taken to ensure a perfectly level, smooth surface, which admits of an even distribution of the pulp and unrippled flow from start to finish. These tables are usually made adjustable up or down for convenience of adjusting the grade, which is usually 1½ inch in 12 inches. Eight tons of pulp matter—that is, 1.15 ton solids and 6.85 tons water—can be passed over this table per hour without causing undue rippling or waving on the plate surface.

Inside amalgamation on copper plates fastened to the mortar has for some time past been replaced by the more general rule of feeding a little mercury into the mortar box every hour. The first method was found most undesirable; the coppers being damaged, pieces of amalgam became detached and afforded an easy means of pilfering by Kaffirs or dishonest workmen. The second method is preferred, not so much from its ability to collect a very large quantity of gold in the mortar, but by feeding the mercury in proportion to the value of ore being crushed, or about equal the gold contents in ounces per ton, it gradually works out of the box onto the table, and, being partially amalgamated, more readily adheres to the top portion of the table. This constant supply is claimed by mill men to keep the plate in the most perfect condition; but as, however, only about 4% of the total gold won by the mill is collected in the mortar box itself, it can hardly be claimed that this is a very profitable source of recovery when the loss of mercury is taken into account through this practice, it being about double that resulting from purely outside amalgamation.

The preliminary setting of plates is well known, and it will suffice to say the copper must be thoroughly well cleaned before the mercury is used; the plate, being carefully kept clean, is allowed to accumulate a thin layer or skin of hard amalgam, and, when this is accomplished, the routine work of dressing, scouring, brushing and the many attendant hurrying methods so dear to amalgamators is continued day by day. By thoroughly scouring or loosening the amalgam by means of rubbing the whole surface of the plate with a little clean sand or gritty matter, the amalgam becomes pasty and is easily removed without unduly affecting the copper itself, as with a chisel or other sharp instrument. Where this work is well done, the maximum amount can be taken from the plate each shift, and will prevent undue accumulation, besides largely obviating the necessity of frequently steaming the plate.

As the extraction (by assay) is considerably affected through neglecting to secure day by day the total gold deposited on the plate, I shall prefer to return to this important point further on.

The plates are brushed with a soft hairbrush, or lightly rubbed up every four hours, taking off any deposit of fine, heavy concentrates, black sand, etc., which always more or less settles on the clean surface of the mercury. When plates are in good working order they have the appearance of a dull mirror and are of a peculiar, stiff, pasty feel.

Steaming should be avoided as much as possible, as it often results in buckling the plates, through irregular expansion and contraction of the copper, and, where the plates are well scoured each shift, it will not be found necessary more than once in six months.

The application of steam as a means of heating the plates before hard accumulations of amalgam can be readily scraped off, is so well known that I need only say mill men are agreed on its utility as a safe and effective means of easily removing the amalgam from the plates.

Having now dealt with the usual practices, I find myself confronted with the still more imperfect result of only a little more than half the gold contents of the ore. I do not believe we shall ever be able to say: "The contents of 500 tons you crush per day contained so much (by assay), and that your due recovery being, say, 55%, please account for same." But I do claim that mill men are not fully alive to the responsibilities imposed upon them when they allow a difference of 5% to pass between theoretical and actual extraction, the actual amalgamating powers of the mill having been carefully determined on the average ore from the mine over a lengthy period—say, six months.

Either the assays must be wrong or the sample is contaminated with fine particles of floured amalgam—the latter being more often the case—and, if so, these unreliable samples may be looked for throughout the whole recovery process.

The average extraction per cent in fine gold recov-

* Journal Chemical and Metallurgical Society, S. A. (condensed).

ered from mills (by assay) is 57%, and varies between 52% and 65% in different mills. This in itself is of less consequence than the actual variation that frequently occurs in any one particular mill. If the ore is of such a refractory nature, and will only allow a specific recovery, then let us count on the mill regularly returning this fixed amount.

That inaccurate samples are responsible for more than half our troubles is certainly the case; but these inaccurate samples are chiefly the outcome of inside amalgamation.

The screen is a controlling factor, largely governing the quantity of gold that can be caught, but is by no means accountable for differences in which amalgamators appear to take so little interest. Accurate samples can be obtained in any mill where the importance is recognized by the man working same, and it can hardly be expected that any completeness is likely where no accurate knowledge of the result is secured.

Assaying Cyanide Solutions.

TO THE EDITOR:—As the latest among the meteoric shower of schemes for the assaying of cyanide solutions, I notice one written by A. H. Jones of the Smuggler-Union, Telluride, Colo., in which he recommends the use of zinc dust in acidified solutions for the precipitation of the gold and silver values from the solution, the same being removed by filtration.

This method seems to possess considerable ingenuity, as, from his description, I am led to believe that the reducing agent here is the hydrogen evolved and is not due to the action of the metal in displacing the values in the solution.

Mr. Jones states that, after due trial of all the other methods, he finds this to be the most reliable, and further points out its simplicity, and also its error; but he gives us only a broken vision as to its accuracy when he states that he has not been able to check out the clean-up at that mill. I, for one, would like to hear from Mr. Jones the reason he assigns for this discrepancy—whether due to the infusibility of zinc silicate or loss by sublimation with the zinc during assay or incomplete precipitation of the gold and silver.

I realize that a better method than the lead tray is wanting when solutions of a low value are to be determined; but, with higher values—for example, as we have here—I have found no difficulty in the use of the lead tray method and in the initial run, after which we made a complete clean-up, all the zinc being cut down. I found that the solution assays were high, to the extent of .18 of 1%, the solution assay checking out the clean-up slightly better than the sand assays. W. H. DAVIS,

Supt. Mill Idaho Gold Coin M. & M. Co.

Bear, Idaho, May 24.

California Polytechnic School.

First Annual Catalogue of the California Polytechnic School, a new State institution, being established at San Luis Obispo, has been received.

The purpose of the school is to furnish to young people of both sexes mental and manual training in the arts and sciences, including agriculture, mechanics, engineering, business methods, domestic economy, and such other branches as will fit the students for the non-professional walks of life.

The course of study outlined includes domestic science, agriculture, horticulture, animal industry, dairying, carpentry, iron work, freehand and mechanical drawing, physical geography, botany, entomology, chemistry, physics, mathematics, English, history and civics. The school announces a three-year course, and will open for students in September, 1903. The school is open to any boy or girl fifteen years of age who has completed a grammar school course, or who can pass an examination covering essentially the same ground. Applications to enter the school must be made on forms, which will be mailed to any one requesting.

A Revived Mining District.

Written for the MINING AND SCIENTIFIC PRESS.

In the northern part of Gilpin county, Colo., there is a district extending from Rollinsville west, about 8 miles, and from Wide Awake to Phoenix, about 6 miles, making a territory 8 miles east and west by 6 miles north and south. This district was opened up in the early sixties, and a great deal of placer min-

ing by the Northwestern Colorado Exploration Co. W. H. Knowles of Denver is manager. They have recently installed a 25 H. P. Hendrie & Bolthoff hoist. This property is being worked under a long time lease. The Benton is located near the Perrigo.

A little farther down the hill, in Gamble Gulch, towards Rollinsville, is the Gold Dirt mine, which has a record of having produced over a million dollars. This property is being worked

Perrigo Mill, Gilpin Co., Colo.

ing, sluicing, and in some cases milling was carried on, but the mills were very crude, and the ruins of some of them can be seen to-day. Wooden stems, cast iron shoes, and pieces of granite for stamp heads were used. Soon after the discovery of rich silver ore at Georgetown and Silver Plume, in Clear Creek county, most of the miners and prospectors left for the new fields, and active mining was never resumed except in a few instances, such as the

by the Pittsburg Con. M. & M. Co. under a long time lease. It has produced some high-grade smelting ore, which would permit of the excessive wagon haul to Black Hawk.

About 2 miles from Rollinsville is rich placer ground being worked by Stephenson & Bahcock. This property is located on Beaver creek.

Near here is the Blue Grass M. Co., operating the Champion, Decoration, Lone Star and Tenderfoot shafts.

Battery and Shaking Table, Perrigo Mill, Colo.

Perrigo, Gold Dirt, Stewart, and a few others.

The accompanying illustrations show the 30-stamp mill now in use at the Perrigo mine. This mine is worked by tunnel. The main tunnel is about 4000 feet in length. It is stated that this property has produced \$1,000,000 during the past five years. The mill is situated several feet down the hill from the mouth of the tunnel. This was done in order that the ore could be handled by gravity in the mill. The mill has 125 tons capacity. Plates and tables are used below the stamps. The concentrates are hauled by wagon to Black Hawk and shipped to the smelter. It is the intention of the owners, Potter & Lightborn of Central City, to erect a cyanide plant at the mill to handle the tailings. They also intend putting in a large power plant for supplying the surrounding mines with power.

The Benton mine is being operated

They have a large body of ore blocked out in the Champion awaiting the completion of their new 10-stamp mill. At the 250-foot level of the Champion they have smelting ore that averages \$30 to \$56 per ton. At present they are driving a crosscut 300 feet to reach the Decoration vein. This will cut the vein 270 feet below the surface. A crosscut is also being run from the Lone Star to the Tenderfoot. The concentrates will average \$27 to \$40 per ton. They have one 6x8 and one 8x10 hoisting engine and 40 and 60 H. P. boilers. R. L. Alexander is Sup't.

In this district there are other properties believed to be as good as the ones mentioned, but on account of the distance from the railroad, the excessive cost of wagon haul, and the scarcity of timber, they remain idle. On the completion of the railroad to Rollinsville the northern part of Gilpin county will see a steady growth.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Willoughby and Walr groups at Funtier Bay have been sold to the Funtier Bay M. Co. The property consists of the Tellurium and Mountain King groups and the claims are said to show good ore.

Men have repaired and rebuilt the flumes of the Last Chance placer mine, near Juneau, and the work is completed as far as the upper end of the tunnel, a distance of 3000 feet from the dump, says the Dispatch. Grading is in progress across the rock slide at the upper end of Last Chance Basin, where 600 feet of the main flume will be rebuilt. This group is owned by the Jualpa Co., and they expect to begin hydraulic mining by July 1.

A 10-stamp mill is on the ground for the Bessie G. M. Co., at Yankee Cove, near Juneau. Superintendent P. Early has built a road to the mines from the beach. He will bring the boiler and engine from the 5-stamp mill down the skidway to the beach to run the sawmill.

ARIZONA.

COCHISE COUNTY.

Development work was started last week on the Big Four group of claims, near the Golden Era mine, near Bisbee. Shafts will be sunk on the ledge showing ore on the surface. The group consists of twenty-four claims. T. Hogan, R. H. Elliott et al. are owners.

Cobbe & Co., owning the Cable lease on the Copper Queen ground, near Bisbee, report making regular shipments of lead ore. The ore is a carbonate carrying values in silver, but no gold.

J. E. Prenty and H. Kreimer have men at work on the Oversight group, east of the Golden Era ground, near Bisbee. They are sinking shaft.

Operations have been resumed by the Princeton M. & S. Co. at the head of Ramsey canyon, 24 miles southwest of Bisbee. The company is made up of New York and Pittsburg men. H. Hamburg is president, with headquarters in Bisbee. The development consists of prospecting shafts, a tunnel 200 feet long and a winze 20 feet deep at the face of the tunnel, where ore was opened. There are six claims. The ore shows values in copper and silver, with trace of gold.

J. Plirung reports the Dutch Bakers group of claims in Warren district, near Bisbee, sold to the Calumet & Arizona Co. for \$200,000, says the Bisbee Review. The group adjoins the other holdings of the Calumet & Arizona and comprises eight claims.

Manager J. E. Bacon of Tombstone reports the Gold Farm group of mines in Dos Cabezas district bonded to Cincinnati, Ohio, parties.

The Dubacher group of nine claims, near the Copper Glance group, in Warren district, near Bisbee, have been transferred to A. L. Morris, et al. The price for the group is reported at \$150,000.

GRAHAM COUNTY.

Superintendent C. B. Spaulding of the Maravilla copper mine, near Solomonville, reports development work progressing. The main shaft is down 500 feet and a flow of water has been struck. It is the intention to sink the shaft to 550 feet and then crosscut 275 feet to main ledge. There are 100 tons of ore on the dump that will average 10% copper. The main body of ore is sulphide and carries also a trace of gold.

MARICOPA COUNTY.

The Chicago owners of the Vulture mine, northwest of Phoenix, are reported intending to resume this month and preliminary work is being done, but the principal work will be sinking a 1000-foot shaft. G. W. Sanders is superintendent.

YAVAPAI COUNTY.

Moynahan & Underwood have pumped the water out of the Storm Cloud shaft in Hassayampa district, near Maxton. The Cash mine has forty men at work. —PICKERELL'S mill and cyanide plant are running steadily.

It is reported the Conger mill, near Jerome, will resume. The Etta mine, from which this mill obtains its ore, has been reopened.

G. Harrington, manager of the Tiger G. Co., states the company will put up a cyanide plant on the Gray Eagle mine, near Prescott, to handle the tailings.

The Yavapai C. Co. expect to open up work on their property in Black Hill district, near Prescott, by July.

CALIFORNIA.

AMADOR COUNTY.

At the Buena Vista coal mine, near Lancha Plana, development is progress-

ing. At depth of 60 feet a body of coal 11 feet in thickness was found, and covering an area of forty acres.

At the Onaida mine, near Jackson, the shaft is down 2280 feet. It is the intention to sink 200 feet more. Sinking has been suspended temporarily, to enable new levels to be opened.

BUTTE COUNTY.

It is reported J. E. Doolittle, et al., of San Francisco, will work the blue lead on the Bangor mine at Bangor. It cannot be worked by hydraulicking because of no place to deposit the debris, but a dredger will be used.

CALAVERAS COUNTY.

The 35-stamp mill at the Wilbur-Wombles mine, near Hodson, is nearly finished. The Rialto M. Co., A. Caminetti of Jackson, Amador county, manager, has been organized to operate in the Gwin mining district. They own a group west of the Gwin mine.

EL DORADO COUNTY.

A 2-stamp mill has been set up at the Independence mine at Slate Mountain, near Placerville.

FRESNO COUNTY.

After a year's idleness, the Mount Hamilton Land & Oil Co. in Alameda, near Coalinga field, has resumed operations. W. H. Kerr, former manager of the Grant Oil Co., is superintendent.

The main pipe line from Mendota to Coalinga was completed last week and is ready to ship oil through to Point Richmond.

KERN COUNTY.

The Associated Oil Co. has made preparation for additional work in the McKittrick field. Five new rigs have been built and others will be added. They are drilling wells on the Green & Whittier and the Central Point in the Green River field, near Bakersfield, and on the Del Monte at McKittrick.

The Potomac Oil Co. has finished its well No. 31 at the Kern River field, near Bakersfield, and has nine wells in operation in the field, besides others at Summerland. All its wells at Kern River are being pumped.

J. Hansen reports operations begun at the cyanide plant of the Stanford M. & R. Co.

The Meadow County Oil Co. will resume operations on its ground near Bakersfield, south of Miller & Lux's ranch, where it has a water well. They will sink a well to 2000 feet.

MONO COUNTY.

The Southern Con., near Bodie, resumed operations last week.

NEVADA COUNTY.

The North Star Co., near Grass Valley, intend to build a 30-stamp mill at the Central shaft and grading began last week, says J. D. Hague, president of the company. Arrangements are also being made for removing the Rogers' mill at Boston Ravine to the Gold Hill mine.

The Gaston G. M. Co. was incorporated last week, with principal office at Carson City, Nev.; S. Weil of San Francisco, C. H. E. Hardin and P. B. Ellis of Carson City. The property of the company is at Gaston Ridge, north of Nevada City.

Manager A. C. Van House of the South Yuba Gravel & Tunnel Co. says preparations are being made to reopen their property on South Yuba river, near Nevada City.

The Murchie M. Co. of Willow valley, near Nevada City, have leased the Texas mill for crushing a lot of rock on hand, the Murchie mill having been destroyed by fire in April.

Work has begun to lay a 24-inch pipe from the South Yuba reservoir on Banner ridge to Union hill. The pipe will be 8000 feet in length and will be used to increase the water supply of the Brunswick, Union Hill and Empire mines, near Grass Valley.

At the Polar Star mine, near Grass Valley, the machinery is in, the galloways frame finished and sinking resumed, says Superintendent J. McCaffrey. The shaft will be enlarged. J. A. Kirby of Salt Lake City, Utah, is president and manager.

The number of men at the Sterling mine was increased this week, to prepare for putting in the machinery, including compressor and drills. The Sterling mines are in Willow Valley, between the Le Compton and Federal Loan mines.

PLACER COUNTY.

H. M. Jarvis of Damascus is operating the Bob Lewis No. 2, and has about forty men employed.

It is reported that the Annie Laurie mine has shut down for lack of water.

SACRAMENTO COUNTY.

The dredger of the Ashburton M. Co., a few miles from Fair Oaks, on the American river, was burned last week. The fire had its origin in one of the electric motors. The dredger was valued at \$75,000.

SAN BERNARDINO COUNTY.

W. Smith, I. Reynolds and S. Alf report finding gold ore a few miles north of Bagdad last week and located thirty claims. Negotiations are reported under way with the owners of the Bagdad group for a bond on the group.

Manager E. H. Stagg reports having men at work putting up the mill and cyanide plant at Barstow to handle the ore from the Bagdad mines.

SAN DIEGO COUNTY.

Oil is reported struck last week in the Yuha well, on the desert side of the Cuyamaca range, east of San Diego. Superintendent Swallow says it is making six barrels a day, but they will go deeper.

SANTA CRUZ COUNTY.

C. D. Dentworth, an oil operator in the San Joaquin valley, proposes to begin operations near Watsonville. He has secured 1248 acres in the foothills north of the Gaffey district, and including portions of the Rossi and Majors ranches, and will begin prospecting for oil this month.

SHASTA COUNTY.

The Balaklala Con. Co. has increased its holdings by the location of a number of additional claims, through W. W. Adams, superintendent, including the Vermouth, Vassar, Virgil, Vessel, Vixen, Vermont, Virgin and Vichy quartz mines and the Sapolio placer mine in the Flat Creek mining district, near Redding.

At the Shasta May Blossom group in the mineral belt a mile northwest of Bully Hill, near Winthrop, Superintendent C. S. Osborn says development work will be increased this summer. The tunnel in the Grant mine of this group is in 212 feet and at depth of 100 feet. Additional track and ore cars have been put in.

SIERRA COUNTY.

At the Twentieth Century mine, formerly the Mountain View mine, 4 miles east of Forest City, the tunnel has been extended 60 feet across the channel, in pay gravel. The mine is under bond to the Twentieth Century M. Co. of San Francisco, J. D. Hoff manager. T. E. Edwards of Forest is superintendent.

SISKIYOU COUNTY.

J. McBride of New York is setting up his quartz mill on north fork of Humboldt creek, near Hawkinsville, and operations are expected to resume this month. A tunnel will be run.

A. C. Brokaw reports having unwatered his quartz mine in Quartz valley, near Fort Jones, and operations resumed. He also proposes to begin work at the Golden Eagle mine on Indian creek. The shaft down 70 feet will be extended to depth of 300 feet.

Superintendent J. B. Scott at the New York mine, on Indian creek, 7 miles from Fort Jones, has fifty men at work. They will sink a shaft to cut the tunnel, which runs 2000 feet into the mountain, and it is intended to extend this shaft 500 feet below the tunnel level. A compressor, hoist and two motors are being put up and will be run by electric power from the Churchill plant. They are crushing 650 tons of ore per month.

TRINITY COUNTY.

The Layman quartz mines, 3 miles southwest of Hayfork, have been bonded to A. J. Van Matre of Sacramento for \$50,000. There are five claims in the group. The ore body is said to be a contact vein between porphyry and quartzite. There is a tunnel 180 feet in length giving a depth of 60 feet on the vein. The ore is free milling and samples native gold. Van Matre will begin sinking a shaft 100 feet in depth from the face of the drift on the ore body.

TUOLUMNE COUNTY.

At the Norwegian mine, near Tuttle-town, grading is finished preparatory to increasing the mill to ten stamps.

The Shawmut mine, near Chinese, is running steadily and 260 men are at work. The new furnace at the chlorination plant is in operation.

The cyanide plant at the Rawhide mine, near Jamestown, is being enlarged, and will have a capacity of 100 tons a day.

The Stockton Gravel M. Co. has men cleaning ditch and repairing flumes at Spring Gap, near Jupiter, to get water from the South Fork of the Stanislaus river. The Star mine, 10 miles east of Columbia, on Rose creek, near Jupiter, is running steadily and ten stamps are dropping in the mill.

A bond for a deed in the Blue Eagle mine, in Jawbone district, east of Groveland, has been given to G. F. Beveridge of San Francisco for \$10,000.

The Hiapoo, east of Columbia, has been bonded by W. Divoll and operations are in progress.

After a run of 600 feet in the Morris tunnel, making a total length of 1100 feet from the opening, the ledge was struck last week in the Birney-Wainwright claim

near Columbia. For 100 feet the companies will work together and then the tunnel will branch to the different claims.

YUBA COUNTY.

The quartz mine owned by G. Smet-hurst, 2 miles northwest of Brown's Valley, is being unwatered.

COLORADO.

BOULDER COUNTY.

Yockey & Merrifield have secured the right of way through the Uncle Sam tunnel, near Eldora, and are driving it to cut the Gold Coin, on which they have a sub-lease. They expect to cut the vein 100 feet below the bottom of the shaft, says the Miner.

CHAFFEE COUNTY.

Three shifts are sinking the working shaft on the Anaconda mine, near Turret, to the 200-foot level, where a station will be cut and a crosscut run south to open up the vein, which was struck by a prospect shaft farther to the east—Superintendent Heaton of the Par Value Co. is increasing development work on the Gold Bug mine.

CLEAR CREEK COUNTY.

The U. S. Geological Survey has begun preliminary work for the Georgetown Quadrangle, with H. L. Baldwin in charge. Triangulation stations have been established, one between Georgetown and Mt. Evans, another on the summit of Republican mountain, one on Big Chief mountain, one near James peak and two near Central City.

Manager W. Jewell reports making arrangements to erect a jigging plant at the Farwell mill at Georgetown to save the zinc values which were formerly thrown out.

S. T. Grant & Co. are shipping ore from the Bush and Norman dumps, near Silver Plume, to Idaho Springs for concentration.

The Dewey & Wheeler concentrating mill at Georgetown has been sold to the company operating the Centennial mines.

Manager Rogers of the Hazleton Co., operating the Baltimore mine, says machinery is being put in place and it is proposed to build a concentrator this summer.

GILPIN COUNTY.

C. A. Noack of St. Louis, Mo., bought the Baer group of claims, on the north slope of Colorado hill, last week. The group adjoins the Helen group on the south side of Black canyon, near Central City, and will be developed by a tunnel to be run in on the vein of the Baer lode No. 9. Operations will begin next week.

The Hall lode in Russell district, near Russell Gulch, was sold last week to S. D. Hanna of Texas. A heavier hoisting plant will be put in and sinking resumed.

J. S. Walters has a lease and bond on the Evergreen mine, east of Apex, which is owned by Mississippi men, and has cleaned out the main tunnel. He intends to sink a shaft. The ores carry values in copper and silver.

Additional machinery is on the ground for the Four Mile Gulch T. M. Co., near Black Hawk, including a 22 H. P. gasoline hoisting plant. It is being set up on the Democrat mine, on Dory hill, in Enterprise district. The shaft is 100 feet deep and it is intended to sink to a depth of 500 feet, which will make connection with the Bryan tunnel workings. J. Brohl is superintendent.

The Viola G. M. & D. Co. has resumed operations on its group near Russell Gulch. They have a group of seven claims and have begun sinking on the Silver lode. Their group is west of the Wal-tham group and east of the Old Town group. A small steam plant will be put in for temporary use, says Superintendent R. Hastie.

GUNNISON COUNTY.

Five miles west of Pitkin the Raymond group of mines is under lease and bond to W. Maher and E. M. Lamont. Instead of continuing the old workings they propose developing the entire series of lodes by a crosscut tunnel which has been driven 400 feet from the level of Ohio creek. This tunnel will cut the Midnight vein at distance of 900 feet, the Monte Carlo at 1300 feet and the Raymond at 1700 feet, attaining a vertical depth on the last of 1200 feet. Four hundred feet of additional driving will cut the Alexander, also belonging to the company, which has not been developed at the surface. All the veins are wet, which caused cessation of work in the original shafts and drifts. The main values are in gold, with some lead and silver. The ore body in the Midnight is 3 feet wide and in the Raymond 4 feet.

HINSDALE COUNTY.

The Hinsdale M. Co., owning twelve claims 3 miles north of Lake City, are driving a crosscut tunnel to open up the Monumental mineral zone at 2200 feet. It has twelve veins located on the surface.

The Bon Homme Co., near Lake City,

are preparing to put up a reduction plant. They have a body of milling ore blocked out.

C. W. Roe has a lease on the Happy Thought dump, near Lake City, and has men at work overhauling his concentrating mill, expecting to have it in operation by June 1. The power for running the mill will be furnished from the Big Kan-aga battery of boilers.

The Captive Inca Co.'s shaft, near Lake City, is down 100 feet. They will put in a plant of machinery this month. W. G. Boyle is manager.

LAKE COUNTY.

Manager H. Manlock of the Doris mine has a lease on the entire Long & Derry group, in Iowa gulch, near Leadville, and will operate that in connection with the Doris. He began work this week.

Ames, McCollum & Son & Carter, owning the Tiger mine, in Iowa gulch, have begun increased development work. The Tiger mine has been worked through a shaft at the northern end of the claim. The vein has been found in a 150-foot tunnel starting from the Ontario, to the south of the Tiger. It is intended by the owners to continue this tunnel through the Tiger and cut the shaft at a depth of 600 feet.

Manager E. A. Hanfen of the Louisville mine at Leadville proposes to unwater his shaft by running a tunnel on the 700-foot level to tap the Yak tunnel, and then pump the water into the tunnel. Workings are at present confined to the 600 and 700-foot levels.

Developments in the Yak tunnel are reported to have shown that the copper sulphide shoot of the Moyer extends as far west as the Minnie Lee.

Work of retimbering the shaft of the Mikado mine, near Leadville, is progressing, and it is expected by June 15 ore shipments will resume. At the 1000 foot level there is a body of zinciferous ore which will be mined and shipped to Canon City and Kansas. In addition to this work, prospecting will be carried on in other levels to locate a sulphide body, says the Leadville Dispatch.

Leadville advices say there is such a strong demand for the better grade of zinc that the mills in the camp are running full capacity and treating 400 tons of crude ore per day. At the Moyer all the low-grade ore is sorted by hand, which is found to be rather expensive, so the mill will be supplied with additional machinery. At present the mill is supplied with rolls, which will be taken out and Huntingtons and concentrating tables put in.

At the Greenback mine, near Leadville, operations will resume this week. The Rialto group of mines in Graham park has been leased to B. Mulrooney, owner of the Greenback. The ground is in Breese Hill district and will take in all of the claims of the Rialto M. Co., giving the new company an area of seventy-five acres. It is intended to sink a shaft near the Rialto and work the northeast portion of the ground from the Greenback shaft, which is down 1300 feet.

LA PLATA COUNTY.

Another shaft has been started to sink 250 feet on the Comstock mine, near Durango. The Comstock is near the La Plata river. The old shaft is 200 feet deep and is in ore at the bottom as well as in two levels above.

The Happy Five M. & L. Co., of Colorado Springs men, operating the Small Hopes group near La Plata, are putting in an air compressor and boiler and expect to be in operation by June 15th. They will continue the crosscut tunnel into the Small Hopes vein, and will also work above the former tunnel level.

The North American M. & L. Co. of New York has bought a group of claims at the head of Madden and Bedrock gulches, near La Plata, and have men on development work. As soon as the ground is opened up it is their intention to build a mill. The ore carries gold and copper.

The Swamp Angel M. Co., of Durango and Denver parties, have begun operations on the Swamp Angel and Gold King claims at Oro Fino, near La Plata.

The Edith M. & M. Co. has been organized by Denver and Durango men, and has ten claims west of the Neglected mine near La Plata. They are putting in a hoisting and pumping plant on the Last Chance claim.

LARIMER COUNTY.

The Boston-Colorado C. M. Co. propose to build a smelter on their group, to cost \$50,000. C. R. Hall and R. Leshner of New York, with J. Macmillan and S. Stark, of Denver, are directors. The company has blocked out ore averaging 10% copper and \$4 per ton in gold. The company have 4500 feet on the main vein.

RIO BLANCO COUNTY.

Sixty barrels of oil were pumped from the Requena well, near Meeker, last week,

and stored in a tank, being an average accumulation of five barrels a day for the twelve days previous to the pumping.

SAN JUAN COUNTY.

D. Pettijohn of Silverton says he will resume work on his Hoosier Boy mine in Lime Creek section, near Silverton. He has opened up 4 inches of ore that runs \$5 in gold, 300 ounces in silver and 20% lead.

The reorganization of the Hercules Con. M. Co. has been completed, says Manager T. H. Kane, and the Little Dora mill and company's mines near Silverton will be started up.

There is being handled at the Silver Lake mill, near Silverton, daily an average of 260 tons of ore, which make 50 tons of concentrates. Two-thirds of the output comes from the Silver Lake mine and the balance from Unity tunnel. The concentrates average \$80 per ton, mainly in gold.

The Brooklyn mine and the Johnson & Lonne mill, near Silverton, were started up this week. The ore from the Brooklyn shipped last year to the smelter is said to have averaged \$80 per ton. Mannion Bros. & Murphy are owners. The ore will be packed from the mine to the mill, about a mile distant.

The San Juan S. & R. Co. has been incorporated by B. O. Read, F. W. McGaffey, G. H. Oliver, F. W. Kendrick, G. A. Marshall, F. N. Stiles, P. E. Houlette, W. F. Ford, F. Barnett, H. E. Dusenbury and F. A. Metcalf, to operate near Silverton.

SAN MIGUEL COUNTY.

The Davis Reduction Co. was incorporated last week by E. L. Davis, H. M. Hogg and M. Lehman to build a customs sampling plant near the mouth of Bear creek, near Telluride. They have bought the mining interests of C. Cromer, which includes a placer claim and water right.

The Smuggler-Union 60-stamp mill at Pandora, 1½ mile above Telluride, is running on company ore from the Smuggler-Union mines and treating 200 tons daily. The 80-stamp mill, 200 yards west of the new, is given over entirely to the treatment of lessee and custom ore. S. T. Elliott, foreman of this plant, G. E. Werner, G. Wearing and W. Brennan, who have a lease on the old workings and a block of new ground in the Sheridan mine, owned by the Smuggler Co. and adjoining the Smuggler claim on the north, are supplying the old mill with 100 tons of mineral daily, which keeps thirty of the stamps dropping. The concentrate shipments from the two plants and cyanide works—the free gold being caught on the mill plates by amalgamation—amount to 125 carloads per month.

It has not been decided just when the old Tom Boy mill, near Telluride, having a capacity of 225 tons daily, will be started, says the Denver Times. This plant has been idle since December, 1902, when the 60-stamp Tom Boy mill was completed and put in operation, there not being water supply enough for milling purposes for both plants during the winter; but it is expected to resume this month, as the snow is melting rapidly.

Under Manager C. Anderson, the Nellie and Ella mines, in Bear creek, near Telluride, are again taking out enough mineral to keep thirty stamps of the Bear Creek 120-stamp mill dropping. It is expected to increase the output this month.

SUMMIT COUNTY.

The Union Con. group, on Gold hill, near Kokomo, resumed operations this week, says Manager Gagan, principal owner.

TELLER COUNTY.

A lease and bond on the Forest Queen mine, on Ironclad hill, Cripple Creek, has been given to J. K. Walsh of Colorado Springs, who is putting in machinery.

The annual report of Manager F. M. Woods of the Doctor-Jack Pot Con. M. Co. at Cripple Creek shows for the year ending May 1, 1903, the following development work, practically all having been done by lessees: Drifts 1119 feet, cross-outs 557 feet, winzes 115 feet, raises 627 feet, total 2418 feet. On May 1 there were twenty leases in operation, seventeen of which were shipping ore. With the completion of the drainage tunnel the company expect to resume operations on company account. The tunnel will give them additional depth and drainage of 238 feet.

Pumping operations at the El Paso Gold King, up Poverty gulch, near Cripple Creek, last week reached the bottom of the shaft, 900 feet from the surface. Before this water course was struck the Gold King was producing 800 tons of ore per month that gave returns of \$25 per ton.

Operations were resumed last week on the Hoosier mine, on Tenderfoot hill, Cripple Creek. The Grafton Co., owning the property, leased the ground last month to J. K. Walsh of Cripple Creek, who has put in a compressor. W. E. Lloyd is superintendent. The terms of the lease require that the shaft shall be

sunk 200 feet during the first year and an additional 100 feet for each year during the balance of the five years of the lease. The shaft is down 478 feet.

The Modoc Co., operating on Bull hill, propose to put in a washing machine to handle their output.

A cyanide mill is being built on the Home Run mine on west slope of Squaw mountain, near Cripple Creek, and adjoining the Santa Rita mine. The Home Run contains deposits of low-grade oxidized ore.

This week the Portland G. M. Co., at Cripple Creek, put skips in operation in No. 2 shaft, replacing the double-decked cages. Two will be used and each skip has a capacity of three tons of ore, which is double that hoisted with the cages. The air compressor is expected to be in operation next week. It will have a total drill capacity of 110 drills. The majority of drills will be on development work.

It is reported the Wrockloff shaft on Burns claim of the Acadia Co. at Altman has been abandoned and the hoisting and other machinery sold.

The Bayard M. & L. Co. was incorporated last week at Cripple Creek, with A. H. Baldwin, W. W. Oaks, J. M. Hower, Jr., T. R. Roundtree and P. Busch directors.

The gold production for Cripple Creek district during the month of May reached \$1,695,415, a decrease from April of \$7235, says the Colorado Springs Telegraph. The tonnage was 48,650, 2400 tons less than April. The Globe mill at Goldfield began operations on May 10. The tonnage and values were distributed as follows:

	Tons.	Av. value.	Gross value.
Telluride mill....	4,500	\$30.00	\$135,000
Portland.....	8,000	30.00	240,000
Dorcas.....	2,750	35.00	96,250
Economic.....	3,500	24.00	84,000
Globe mill.....	400	6.50	2,600
Gillett.....	500	2.50	1,065
U. S. R. & R. Co.	17,000	24.50	416,500
Smelters.....	12,000	60.00	720,000

Totals.....48,650 \$30.00 \$1,695,415

The Accident group, on Gold hill, at Cripple Creek, adjoining the Pointer and Mint mines, has been bonded and leased to B. T. Hickman of Montana for \$50,000. Ore has been opened up in the 300-foot level 200 feet from the shaft.

IDAHO.

BANNOCK COUNTY.

G. B. Rogers, president of the Inter-Mountain G. & C. Co., operating a group of claims 7 miles east of Pocatello, says they are putting in a 40 H. P. engine and boiler on the ground, together with a hoist and pump. Work will begin on a 500-foot shaft. The ledge shows values in gold and copper.

BLAINE COUNTY.

I. E. Rockwell, manager of the Minnie Moore and the Idaho Con. M. Co., near Halley, says operations have begun on the Red Cloud and Contact groups of twenty-five claims that they have taken over. Some of these claims are on the Minnie Moore vein, some are on the Bullion-Deer Creek divide, and some on Red Cloud hill.

BOISE COUNTY.

Manager Rogers and Michigan men have organized the Black Pearce M. Co., to take over the Emke group of mines near Pearl, which they have under bond. The workings consist of 150 feet of shaft and 300 feet of tunnel. They will sink the shaft to the 300-foot level and continue work in the tunnels. R. Anderson is superintendent.

Turtle, Alexander & Lykow, owners of the Jumbo group, in El Dorado gulch, near Idaho City, have bonded the Chickahominy mine.

CUSTER COUNTY.

A company has been organized by F. A. Stacey, G. W. Stewart, W. W. Adamson, F. C. Brennan, E. R. Sherman and Condat & Wise to operate the Sunnyside and Victor mines, on White Knob Mt., 7 miles from Mackay, says the Telegraph. The vein is a contact between lime and porphyry and carries values in copper, gold and silver. They have begun development work.

C. Crane of Salt Lake City, Utah, manager of the Bull Dog mines, near Custer, reports the group under option to Eastern men.

IDAHO COUNTY.

(Special Correspondence).—The Moose Creek Placers Co. report opening new ground this season. Their water supply will be lower than normal, but recent improvements have reduced the cost of operating. Last week 115 43 ounces of bullion, value \$2200, was obtained from ten days piling, with bedrock, races, lowest of three sluice lines, and both undercurrent tables yet to be cleaned.

Newsome, May 31.

J. Jewell, superintendent of the Gold

Reef Co., near Roosevelt, in Thunder Mountain district, says he has run 400 feet of crosscut tunnel and has opened up the ore body. Thirty men are at work on the Dewey and the mill is running. Thirty men are working on the Sunnyside blocking out ore for the mill which will be built this summer. On the Wordenboff two shifts are running a crosscut in ore. C. Brewer, H. Babendorff, et al., are developing the Golden Slipper group and driving a tunnel to tap a 22-foot vein at depth of 90 feet. The vein runs \$6 in gold and twenty ounces in silver on the surface. The mill on the Paymaster on Big Cottonwood creek is running steadily.

KOOTENAI COUNTY.

Near Tyson, the hydraulic plants on the Nellie, Mornford and Harding claims are at work, with good heads of water, and the daily yield of gold dust is reported at \$700. It is expected the water supply will last another month.

OWYHEE COUNTY.

The work of unwatering the Afterthought mine, on War Eagle Mt., near Silver City, has been finished and a contract let by the DeLamar Co. for sinking the shaft an additional 300 feet—a total of 600 feet. The mine will be proven to that depth before running the tunnel from South Sinker gulch will be begun. The proposed tunnel would cut the vein at depth of 1000 feet.

T. B. Hall and F. T. Clemmens of Colorado have an option on the Miller & Walters mining group on the eastern point of Florida mountain, near Silver City. They propose starting an adit tunnel at the north end of the claims on Black Rock gulch to cut under the present workings, which consist of a 500-foot crosscut tunnel opening the veins from the east side, and drifts running north and south, each 300 feet long, from which some ore has been milled running \$25 per ton.

S. B. Longfellow of Ohio has bought the Homestake mining property, near Silver City, and has let a contract to run 200 feet of a tunnel, which at 400 feet will cut 150 feet under the shoot of ore found near the surface. Superintendent Gerling will continue drifting on the vein above.

SHOSHONE COUNTY.

The St. Louis & Idaho M. & M. Co., operating a group of three claims near Burke, are incorporated, with R. J. Collins, I. S. Collins, E. & G. D. Collins and D. B. Barbee.

The Reindeer M. Co., near Mullan, are putting in an air compressor, says President Strode. It is a belt machine driven by water power, with a capacity of 165 feet of free air per minute. The company's water power has a head of 477 feet.

WASHINGTON COUNTY.

C. R. Spear, at the Gold Coin cyanide plant at Black Lake, near Council, says they are working fifty tons per day. A rock crusher, with capacity of 150 tons per day, is in operation, and it is proposed to increase the entire plant to that capacity. They have twenty men at work.

H. W. Reeth of San Francisco, Cal., is reported to have bought the Sommers group of fourteen claims at Mineral for a European company. They propose to build a smelter on Snake river and transport ores to the smelter by an electric road or an aerial tramway.

MICHIGAN.

HOUGHTON COUNTY.

The State Legislature has passed a bill appropriating \$45,000 for the Michigan College of Mines at Houghton for the construction of a metallurgical laboratory. Cyaniding and wet methods of concentration will be exemplified in the equipment and electrometallurgy will receive special attention. It is intended to put in furnaces of larger capacity than is usual in college laboratories. The board of control of the college is taking steps to create a separate department of ore dressing and metallurgy.

The Mesnard, or No. 3 shaft, of the Quincy mine, at Hancock, is sinking from sixteenth to seventeenth level. The first level is 250 feet, the others 125 feet apart. At present rate, it will take two years to reach the bottom stop from No. 6 Quincy and to connect with remainder of mine. The Franklin comes in between on the lower levels, Quincy having been driven out to north of Franklin and stopes opened below site of Mesnard shaft, which ultimately is to operate these workings. The Mesnard is being opened as a mine and drifts are being extended north and south. An average of eight carloads of mineral rock are being sent to mill. The northernmost workings from the Mesnard are 1½ mile from the south drifts of No. 6 shaft. The latter is 4900 feet deep.

Houghton reports say, this month will

mark beginning of a further increase in volume of lake copper production, as four additional stamps are to go into commission, of which Osceola will furnish two, and Trimountain and Phoenix one each. The Osceola, at North Kearsarge, is nearly ready for operation, and before June 1st the mine should be supplying seven stamps.

The dry wall and filling method used successfully in the Baltic mine, near Houghton, is being introduced at the Winona mine at Winona.

The management of the Arcadian mine, near Hancock, has discontinued shipment of rock. Actual mining operations will cease, but the work of testing the ground by diamond drill and the sinking of the southern shafts will be continued under Superintendent Sbiels. The stamp head released by stoppage of Arcadian shipments will be used by the Trimountain mine.

The Franklin M. Co., near Hancock, will put in the third head of stamps at its mill, and it is expected that it will be in operation by August 15.

Work on shaft No. 3 at the Winona mine at Winona is under way. It is 1650 feet south of No. 2 shaft and sinking and raising from the fourth level south of the No. 2 shaft will expedite its opening.

It is reported that the Globe mine, south of the Champion mine, at Painesdale, is to be opened by a shaft this summer. J. Stanton is principal owner.

At the Trimountain mine, near Houghton, this month they expect to begin taking out a full rock supply daily to all four heads at the company's new stamp mill. They have been handicapped on account of delayed mining and milling machinery. Equipment for shafts No. 2 and No. 3 has not yet arrived. The No. 1 is the only permanently equipped shaft, but the mine is supplying 1700 tons of rock daily.

At the Red Jacket shaft of the Calumet & Hecla Co. at Calumet ample power is available for hoisting, but at present the maximum capacity of the four compartments is said not to exceed 1200 tons daily, working twenty hours. The water from the Calumet branch of the mine is hoisted through the Red Jacket shaft, the work engaging the entire services of one of the hoisting engines. The other engine does the hoisting of rock for the two compartments of the shaft, the output of which is 700 tons of rock daily.

The necessary changes in the shaft, and also in the rock house, to permit of the substitution of the skips for the cage system, are expected to be completed by August 1. Bins are being provided at each alternate level at either side of the shaft, commencing with the fifty-seventh. In all, nine of these will be used, and their capacity of nine tons will be similar to that of the new skips now being gotten in readiness. Skips will be box-shaped and in the matter of lowering and hoisting there will be no deviation from present methods. The advantage anticipated is a substantial saving in time in loading and unloading, as it is believed three skips can be operated, compared with two cages under existing arrangements. The engines are capable of hoisting a ten-ton load at the rate of 3600 feet per minute, and allowing for reduced speed at the top and bottom of the shaft, the round trip to the extreme depth can be made in five minutes. The capacity of the Red Jacket shaft, beginning August 1, is expected to be not less than 1800 tons daily, and if the company is planning an increased production, there is more likelihood of the additional rock shipments being forwarded from this source than from the several idle shafts on the Osceola lode, which, in the past, have shown low mineral values (less than 1%, even after a fair rock selection).

ONTONAGON COUNTY.

The management of the Mass mine at Mass City is awaiting the convenience of the Michigan Co. to turn over a head in the mill to the latter. Should the Michigan decide to build a mill also at Keweenaw bay, the Mineral Range Road will extend its tracks to the Michigan mine; otherwise the Michigan will have to deliver cars to the Mineral Range over the St. Paul Road, thus increasing the cost of transportation, says the News.

MONTANA.

FERGUS COUNTY.

The Gold Reef M. Co., at Gilt Edge, have opened up a body of ore on the Chicadee and Peerless claims of the group. The company has twenty men on prospecting and exploration work. They also have men building the roasters and it is expected the roasters will be ready for operation by August 1st. The mill has a daily capacity of 150 tons. When the mill run is resumed the output of the roasters will be mixed with the oxidized ore and pass through the mill for treatment, a better treatment of the black ore being thus secured and the steady oper-

ation of the mill insured, says N. J. Littlejohn of the company.

GRANITE COUNTY.

In Georgetown district, near Phillipsburg, the Southern Cross mine is being worked by L. Evans of Butte under lease and bond. Mr. Evans was in the mine last week and put a crew of men to work. Considerable dead work is to be done before much ore can be taken out, but it is expected by July some ore will be ready for shipment to the smelters. The Southern Cross adjoins the Cable mine on the west, and at present low-grade ore is being worked in the mill. It is proposed to put in a cyanide plant.

At the Cable mine, 1½ mile east of Phillipsburg, prospecting is being done by a diamond drill. The ore bodies continue to the depth so far reached by the drill, the ore samples obtained being free-milling. Work is progressing on the improvements at the mill. It is the intention of the company having the lease to overhaul the mill, remodel it and increase its capacity.

Plans are being drawn by the Granite-Bimetallic Con. M. Co. for their reduction works near Phillipsburg. It is thought a smelter will be built. The company own a smelter site at the mouth of Boulder creek, near Flint station.

JEFFERSON COUNTY.

An Eastern company, H. Frylor of Corbin manager, has bonded the Gaffney group of mines, near Wickes, for \$30,000. The group consists of six claims and the ore is principally copper and silver of a concentrating grade. A 100-ton concentrator will be built near the mine.

Shipping ore assaying \$35 a ton is reported struck in the Daly mine at Wickes. M. R. McGee, manager for an Eastern company, who relocated a mine near Wickes, reports a body of oxidized iron ore which contains native copper.

The Montana Ore Purchasing Co., operating the Katie concentrator, near Basin, is making plans for the enlargement of the mill for machinery to increase the capacity. The mill is concentrating 1000 tons of ore per day, and it is stated this will be raised to 1500 tons.

D. J. Sweeney, operating the Silver-smith mine, near Basin, under lease and bond, says shipments are being made regularly from this property which run \$3000 per car.

W. A. Kidney and A. Ray have a lease and bond on the Comstock mine in Cataract district, near Basin. It is the intention to put in machinery and resume sinking the shaft.

Several feet of ore, averaging \$25 a ton, are reported struck in a crosscut from the 300-foot level of the Daly mine at Wickes. It is proposed to concentrate the ore this summer, and the mill at Corbin, several miles down the valley, will be utilized for that purpose.

The Cataract M. Co. propose to build a 200-ton smelter at Basin, work to begin next week. The Cataract Co. has done 9000 feet of development work on its claims and 4000 tons of ore have been shipped.

MADISON COUNTY.

The Granite Mountain M. Co., owning fourteen claims in Summit district, near Virginia City, has resumed development work after an idleness of ten years.

POWELL COUNTY.

In Red Lion district, between Danielsville and Cable, the Barton and Jones group of claims at the head of Warm Springs creek is bonded to the Montana M. Co. of Marysville for \$40,000. There are three adjoining claims. The main shaft is sunk on the lead to depth of 180 feet, and the lead is crosscut in the shaft at 80 feet, 120 feet and 180 feet depths, showing 34 feet wide. The values are in free-milling gold. The mine is on the contact between granite and quartzite. Fifty feet from the main shaft on the Barton and Jones there is a parallel vein 2 feet wide, assaying \$40 in gold.

PARK COUNTY.

It is reported the Montana Coal & Coke Co. are planning to open up the O'Hearn mines, west of Aldridge, and to take the greater portion of the coal for coking. A terra cotta pipe will be put in from the mines to Horr and the coal will be crushed and washed and floated down to be coked, says the Butte Intermountain.

NEVADA.

ELKO COUNTY.

J. J. Driver, H. Hussey et al. of Ogden, Utah, are working the Eclipse mine at Tuscarora.

STOREY COUNTY.

The electric hoist at the Andes mine, near Virginia City, has been completed and work resumed.

A 50 H. P. electric hoist is being set up on the Brunswick lode, near Virginia City, at Shaft No. 1.

WHITE PINE COUNTY.

Superintendent Shaw of the New York & Nevada C. M. Co., whose mines are at Copper Flat, near Cherry Creek, has placed a boiler and engine on the No. 2 shaft and put on more men, sinking a shaft to connect with the 400-foot level. He is also sinking a three-compartment shaft.

Last week the Jupiter group of gold and copper bearing claims, near Ely, were sold to the McKinley M. & S. Co., says W. N. McGill, local manager.

NEW MEXICO.

GRANT COUNTY.

The remodeled smelter of the Shamrock G. & S. Co., near Pinos Altos, resumed operations last week. The power drills in the mine are in operation. The Shamrock plant will handle custom ores in addition to the output of the mines of the company, among them being the Silver Cell mine.

The Houston-Thomas group, near Pinos Altos, have been sold to C. A. Stevens of New York. There are three claims in the group, which is developed by tunnels. The ore carries gold and silver.

The American Con. C. Co. continues work on the Atwood mine in Shakespeare district, near Pinos Altos. One shaft is down 360 feet and yielding forty tons of ore daily, running in copper, gold and silver. Another shaft is producing twenty tons of ore per day. The leaching process will be used on some ore as soon as the leaching plant is finished. The smelting ores are being sorted out and shipped.

C. R. Luton, manager of the Michigan-New Mexico C. M. Co., operating in Shakespeare district, and of the International G. M. Co., owning a group in Malone district, 14 miles north of Lordsburg, says work on the properties of both companies is being done under W. H. Stevens, superintendent of both companies. A strike is reported in the Dacotah Pearl and Carbonate claims of the Michigan-New Mexico Co., showing average of \$12 per ton.

RIO ARriba COUNTY.

The Keystone M. Co. has decided to build a smelter on its properties in Bromide district, near Tres Piedras, Taos county.

SIERRA COUNTY.

At Fairview, the New Era mine is shut down, the company having decided to operate a property at Kelly, of which it is owner.—At the Silver Monument mine, says Manager Phillips, a tunnel will be started near the mill to strike the vein on the Cuba Libre and along through that property to the old workings of the Monument.—Phillipsburg, the new camp below Kingsburg on Poverty creek, is reported improving. The mill and cyanide plant for the Minnehaha mines are building. The main shaft is down 60 feet, and levels are being run north and south at 57 feet.

TAOS COUNTY.

Superintendent J. P. Rinker of the Keystone C. M. Co., which has nineteen mining claims in the Bromide district, 12 miles from Tres Piedras, says work is progressing on the Pay Roll, the principal claim, on which a shaft of 250 feet is sunk. The vein averages 18 feet in width and a shoot 4 feet thick is being worked, which assays \$15 in copper, gold and silver.

OREGON.

BAKER COUNTY.

Preparatory to putting up their mill, Superintendent P. A. Brady of the Belcher mine, near Sumpter, is getting ore blocked out. He is raising from the Belcher tunnel in shoot No. 3 and also driving this tunnel ahead to reach the point where the Golden Gate vein crosses the Belcher. The 500-foot tunnel being driven on the Golden Gate has opened an ore shoot showing 3 feet of milling ore. The raise from the third shoot in the Belcher tunnel will give backs of about 500 feet. The mill will be below the mouth of the Belcher tunnel.

L. V. Swiggett, manager of a Portland company, last week bought the west extension of the Crown Point, Cable Cove district, near Sumpter. There are two claims in the group. A shaft will be sunk to open up the vein and drifts extended. Manager C. P. Barrows, of the Maid of Erin mine, located on lower Powder river near Sumpter, has put up a 10 stamp mill, which will be operated by water power, water being taken from the main stream, 2½ miles above. The mine is owned by a company of Buffalo, N. Y., men.

Sinking operations are temporarily suspended at the Golden Wizard mine near Sumpter, says Manager J. M. McPhee, to prepare the upper levels for a mill. In the upper workings they are blocking and driving the main tunnel ahead. It is quite expensive to handle the water and they have concluded to build the mill to make the mine pay for its own develop-

ment. One tunnel has been driven on the vein 312 feet, and 150 feet of crosscuts made from it, proving a vein 40 feet in width. It is intended to continue this tunnel 300 feet farther on the vein, which will give a depth of 275 feet. One hundred and twenty feet below the main tunnel a station has been cut and drifts and crosscuts run from it. The ore body averages \$10 in gold. A plant with both stamp and roll crushing, for concentrating and amalgamating, will be erected, of either 10 or 20-stamp capacity.

The Big Creek G. M. Co., of Whitney, has been incorporated by B. Miller, J. W. Copeland, J. D. Grove and M. K. Young. The holdings of the Big Creek Co. include nine claims between the Morning and the Snow Creek mines in Greenhorn district. They have men at work driving a crosscut for the Snow Creek and Morning ledges.

T. J. Simmonds, manager of the Morning mine in Greenhorn district, near Sumpter, says their Bryan mill was put in operation this week. The mill has a daily capacity of thirty tons. The upper workings are being timbered.

The "boom" method of placer washing is being used at Buck Gulch, near the summit of Granite divide, near Sumpter, says the Blue Mountain American. C. A. Pray is superintendent. A small dam is built in the stream above where washing is to be done. An exit for the water is made, and into this is fitted a gate that is opened by the rising water and closed by its own weight when water recedes—result being an alternate flushing of stream channel below with such force as to make effective current. Riffles are arranged for gravel handled to pass through, and by the aid of men the main channel is kept free of heavy boulders that interfere with washing. No one is required to handle a nozzle or to attend the reservoir. Every ten to fifteen minutes the gate opens and, night or day, this washing proceeds, the gate, after opening, slipping down into position, because float regulating it has been lowered.

Manager Reed of the Auburn Deep M. Co. says their hoisting plant is in operation on the Auburn placers on Poker Flat, near Auburn. Pumps also have been put in.

GRANT COUNTY.

W. E. Saunders, C. S. Miller, L. Walker, A. Mohr, J. M. McPhee, of Sumpter, and C. E. Peterson, of Tacoma, Wash., are reported to have organized a company to explore the coal lands in John Day region. They have 1108 acres of land covering portions of the coal fields as exposed by the outcrops of the seams, on the John Day river, 75 miles below Canyon City.

At the Alamo mine, at Alamo, Superintendent McGuigan says an intermediate tunnel is being driven between tunnels Nos. 2 and 3. A body of ore has been opened up and the mine has backs of 400 feet.

JACKSON COUNTY.

Superintendent J. P. Harvey of the Blue Ledge C. Co. of Upper Applegate, on Joe creek, near Jacksonville, says a diamond drill outfit is being set up to prospect their ground. The Blue Ledge Co. has fifteen men at work on two tunnels they are driving at the main ledge.

JOSEPHINE COUNTY.

A strike of copper ore is reported on Collier creek, in Lower Illinois River district, near Grant's Pass, by F. Reed of Roseburg, et al. Some of the ore shows native copper. The find was made in the Collier creek country, 18 miles south of Rogue river and west of the Illinois river, of which Collier creek is a tributary. Sixteen claims were located.

WALLOWA COUNTY.

A 20-stamp mill will be built on the Tenderfoot group, says President E. R. Tripp of the Tenderfoot G. M. & M. Co. Their mines are 18 miles south of Joseph. A cyanide plant for the treatment of tailings will be erected at the same time. The Tenderfoot group consists of twelve full claims.

SOUTH DAKOTA.

CUSTER COUNTY.

The Ohio-Beaver Creek M., M. & D. Co. has been organized with T. C. Lentz, of Columbus, Ohio, president, to operate a group of claims on the headwaters of Beaver creek near Pringle.

LAWRENCE COUNTY.

The Sunbeam mine, near Hill City, has suspended operations to put in an air compressor. The shaft is down 300 feet, with stations cut at the 100 and 200-foot levels. It is reported the company will begin building a 100-ton stamp mill this month.

TEXAS.

CHEROKEE COUNTY.

Austin reports say that pursuant to the decision of the Board of State Peniten-

tiary Commissioners the Iron Industry at the State Penitentiary at Rusk resumed last week. About 500 convicts are to be employed in the manufacture of pig iron and iron pipe.

UTAH.

In the ore and bullion market the month closed on settlements aggregating \$1,561,300, this total independent of settlements on the output of copper, gold and silver-bearing bullion which was forwarded from the furnaces of the independent smelter, says the Salt Lake Tribune. The output reached approximately 80,000 tons, with the usual volume of ore going to outside plants—being a slight shrink from the April product: Crude ores and concentrates, \$742,200; base bullion, \$662,700; gold bars and cyanides, \$206,000. The settlements for the week ending May 30th aggregated \$709,300. The shrinkage is accounted for in the interruptions at two of the valley plants.

BEAVER COUNTY.

Manager W. A. Farish of the Majestic C. Co. says the O. K. mine, near Milford, will be equipped with a 300-ton concentrating plant, which will be built this summer. The directors have also decided to connect all of their mines with the smelter with their own railway system, which will be of 2-foot gauge.

GRAND COUNTY.

L. Taylor, part owner of the Big Indian group of copper mines near Moab, reports a strike made in the Blue Jay group owned by J. Skewes of Salt Lake City, superintendent of the Big Indian. The Blue Jay group is a north extension of the copper-bearing zone on which the Big Indian is located. Seven feet of ore were opened up, showing azurite and malachite. The Big Indian is still idle, pending its equipment with reduction works, says Taylor, although the usual amount of prospecting is going on.

IRON COUNTY.

W. F. Baker of Denver, Colo., has a bond and lease on the Rice group of eight mines on Rice hill, near Stateline, for \$30,000.

The Johnny mill at Stateline is crushing thirty-three tons of ore daily, and the directors have decided to add ten stamps more. There are forty-five men at work in the mine and mill. W. J. Dooly is manager.

JUAB COUNTY.

Near Eureka sinking has been resumed in the incline in the Eagle & Blue Bell mine, which is 600 feet deep. The mine is being developed by the Bingham Con., which holds an option on it.—The May Day shaft is to be deepened 100 feet. A station has been cut on the 200-foot level and a donkey hoist set up. From that point the shaft will have two compartments.

SALT LAKE COUNTY.

It is reported that C. M. McNeill, manager of the United States M. & R. Co., has an option on De Lamar's one-fourth interest in the Wall-De Lamar group, near Bingham.

Superintendent W. J. Craig says connection was made between the upper and lower sections of the Yampa tunnel at Bingham. The Yampa has 6500 feet of development, including the 1700-foot incline (on the dip) and Yampa (upper) tunnel, 1500 feet along the vein.

Superintendent A. Mayberry of the Old Telegraph, Old Jordan and others at Bingham reports developments on the Silver Shield mine progressing. Franklin tunnel on Niagara ground has been extended into Silver Shield territory for 80 feet.

The C. Peterson holdings in the Madsen G. M. Co. of Salt Lake City have been sold, by which the Trapper's Pride group on Gold mountain were transferred to R. W. Madsen and W. A. Worthing for \$30,000.

SUMMIT COUNTY.

The Daly-West, at Park City, beginning June 1st, made an increase in the schedule of wages to the following: Miners, \$3 per day; muckers and carmen, \$2.75. This raise was unsolicited.

The Wabash option on the Storey group of mining claims at Park City, owned by P. Shanley, has been allowed to lapse.

Superintendent J. S. Free of the Park City G. & S. M. Co. states the shaft is down 200 feet and a crosscut started to locate the ore bodies.

To operate the St. Louis and Vassar groups of mining claims, near Park City, the St. Louis-Vassar M. & M. Co. has been incorporated at Salt Lake City. The group is 2 miles southwest of the Quincey mine of the Daly-West holdings. In prospecting the group a tunnel was driven to the contact, opening up ore that afforded 89 ounces silver and 24½ lead, with values in gold. Of this class of ore there is exposed 2 feet. The same channel has been tapped on its dip 90 feet below the tunnel level. M. Shaughnessy, R. Gorlinski,

J. R. Walker, J. Hogle and T. F. Singler are directors.

TOOELE COUNTY.

Work has been resumed on the Buckhorn group of mines on the ridge between Ophir and Dry canyon, on which P. S. Kimberly & Co., of Salt Lake City, have an option. It adjoins the ground of the Ophir Hill and Montana M. Companies on the north.

C. Rooklidge, superintendent of the Queen of Sheba's mine and mill in Deep Creek district, near Ibadah, says development work is progressing and dropping five stamps in the mill, handling fifteen tons per day. It is expected to increase the capacity next season.

The tailings plant at Manning, near Mercur, belonging to the Con. Mercur M. Co., is in operation.

UTAH COUNTY.

An iron mine east of Santaquin, in the foothills, is being opened up by a Salt Lake company, with W. T. Openshaw of Santaquin as superintendent. The ore is of a quality for fluxing purposes.

WASHINGTON.

FERRY COUNTY.

The Mountain Lion G. M. Co., near Republic, are shipping ore over to Grand Forks, B. C.—The Lone Pine-Surprise continues shipments. They have thirty-six men stoping ore in the Lone Pine workings.—W. M. & F. Crummer have a lease on the Black Tail mine and are stoping ore.

The tunnel of the Belcher mine, near Republic, is reported to have crossed the main lode of the mountain for 50 feet. It is proposed by the Belcher Co. to start another tunnel from a point lower down, which will give an additional working depth on the vein of 150 feet. The Belcher Co. has bonded additional claims adjoining the Belcher mine for \$5000 from the Iron Belt M. Co. J. L. Harper has bonded the Bigham and Moody group on upper Lambert creek, near the Belcher mine.

Manager Ridpath, owning a controlling interest in the Lucille Dreyfus mine, near Danville, says it is his intention to run a 1400-foot tunnel to tap the ledge at depth of 600 feet. As soon as a railway siding is put in, ore shipments will be made to the smelter.

LINCOLN COUNTY.

W. A. Crawford, operating the Van Horn group in Cedar Canyon Camp, near Davenport, says he has struck the ledge in the tunnel, showing 20 feet of free-milling gold ore.

OKANOGAN COUNTY.

(Special Correspondence)—At the Bonanza Chief mine, in Slate Creek district, near Mazama, a lead 9 feet wide, showing free gold and tellurium, has been opened in the tunnel.

The Mammoth people are sinking a winze. The lead shows 5 feet of quartz at a depth of 22 feet.

The Mountain Goat is sinking in the upper tunnel to connect with the raise in the lower tunnel for air.

The Eureka is expected to start up next week.

Mazama, May 31.

STEVENS COUNTY.

On Greenway mountain, near Valley, development work is progressing in the iron mines owned by Great Northern interests. It is said the railway will be built to the property and machinery put in for the permanent operation of the mine. The crosscut has been run 35 feet through ore, running 40% iron, with no undesirable elements. A working shaft will be sunk higher up the mountain than the present site. The company's main offices at St. Paul, Minn.—The Iron Hill mine adjoins the United States Marble Co., which will also be benefited by the building of a railway. The marble company is hauling blocks of its green marble 8 feet long to the station at Valley for shipment to New York.

The King G. & C. M. Co. is operating the Edna mine at the foot of Greenway mountain.

WYOMING.

CARBON COUNTY.

The owners of the Gibraltar mines at Grand Encampment are putting in a steam pumping plant, as the flow of water has been increasing. They have an 18-inch shoot of covellite.

FOREIGN.

AUSTRALIA.

WEST AUSTRALIA.

The electric slimes treatment plant at Southern Cross is in operation. Once the slimes reach the vortex mixer no manual labor is required, everything being done by electric motors, says the Sydney Mining Standard. The mixer is driven by a 10 H. P. motor. Weak cyanide solution

is used in breaking up slimes, which are pumped into elevated launders by three-throw pump 9 inches by 18 inches stroke, and driven by 7½ H. P. motor; launders convey liquid slimes into five 80-ton vats. Agitators driven by electricity are used to prevent settlement, driven by 20 H. P. motor. After six hours' treatment slimes are pumped by two horse power motors into launders and conveyed into two 45-ton spitzkasten. After slimes have settled somewhat, overflow from the spitzkasten is pumped into large feeding tank by 2 H. P. motor, then solution passes through two clarifying presses, then through precipitating boxes, and returns to vortex mixer to be again used. The heavier residues that have settled in spitzkasten (inverted pyramids) are discharged from bottom, and pumped into two washing cones, where they are thoroughly washed in a weak cyanide solution, then they are discharged into a slimes paddock, drainage from which is conducted to vortex mixer. The gold-bearing solution passes through precipitating boxes containing lead-coated zinc shavings.

BRITISH COLUMBIA.

Mining developments on Texada Island are reported progressing. Work on the tramway from the Cornell mine to salt water is going ahead. The Marble Bay mine is shipping ore to the smelter. Eastern men have a lien and bond on the Garland mine and have men at work sinking. The Puget Sound Iron Co. are running open cuts on various places on its copper deposits. H. McClusky has bought the Portia and Francis claims. The Francis is stated to show free gold.

Superintendent J. M. Long of the Yreka C. Co.'s mines at Quatsino says as soon as the additional machinery has been set up, about June 10, shipments of 3000 tons per week are expected to be made. The June group of claims on the east side of the southeast arm of Quatsino sound will be opened out and connected with salt water by a tramway ½ mile long.

A wire tram 3 miles long is being put up for the Silver Cup mine in the Lardeau district to connect the mine with the 125-ton concentrator. D. C. Forbes is manager of the Silver Cup and Nettie L. mines, both near Lardeau.

A number of Fort Steele men have located coal lands on Fording river, near Fort Steele, on unreserved crown lands. It is reported coal has been found on several tributary creeks and on Fording river. Last year the Trail smelter company located a block of forty-two claims, and have received a license from the Government to prospect the land for coal.

Shipments from Rossland camp for week ending May 30 and for the year to date are as follows:

	Week.	Year.
Le Roi.....	1,920	75,334
Center Star.....	1,320	34,618
War Eagle.....	1,020	23,445
Le Roi No. 2.....	360	11,117
White Bear.....		277
Velvet.....	100	2,626
O. K.....		25
Giant.....		335
Kootenay.....	350	1,295
Homestake.....		90

Totals.....5,070 149,152

At Le Roi No. 2 at Rossland the work consists of stoping on the second, fifth, third and fourth levels, development on the 700-foot level and diamond drilling on the 900-foot level. Building operations are being carried ahead on the concentrator plant.

The work of enlarging the Granby smelter at Grand Forks is progressing. The foundations of the two additional furnaces have been completed. Portions of the plant, including electrical equipment, are on the ground. The extension to the blower room has been completed and work started to build the extension to the flue dust chamber. Six furnaces, with a daily capacity of 2100 tons, will be in operation by July 15.

The London office has issued the following report on the operations of Le Roi No. 2, Ltd., at Rossland, for the month ended March 31: Output—Shipments for the month, 2506 dry tons; value per ton, less smelting charges, \$14.69; total value, less smelting charges, \$36,841; less copper adjustment, \$23; total, \$36,812, from which mining charges have to be deducted.

J. A. Turner, W. Walsh and M. Scully of Nelson have bonded the Queen gold mine near Erie for \$50,000, and operations will begin this month.

Manager Warner has men at work on the Wonderful mine, near Slocan.

Managing Director Colloff of the Arlington and Speculator mines, near Slocan, says on the Speculator the tunnel has opened up a body of ore 6 feet wide. There are 5 inches of rich ore on either side of a 5-foot ledge of concentrating grade. These streaks carry native silver and sulphides. The tunnel is in 3000 feet,

having cut through the Speculator and Speculator fractional claims and is now into the Mineral Mountain claim. On the Arlington a body of sulphide ore 1 foot in width was tapped in a tunnel 2600 feet from mouth of drift and at 370 feet depth.

At the Wild Horse Creek placers, near Fort Steele, the Ban Quon Co. have 1500 inches of water supplying two 6-inch giants.—Reports from Perry Creek placers, near Fort Steele, say the steam dredge began operations last week.

Construction work is under way for the compressor and hoisting plant for the Spitzee mine, near Rossland. A five-drill compressor will be set up, and the hoist will have a capacity for 500 feet. The intention is to sink to the 200-foot level this summer and continue mining on the 100-foot level.

H. F. Almy, manager of the Argenta mines, reports he has succeeded in interesting the Provincial Government in building a trunk road from Kootenay lake up Hammil creek, across the Furcell range of mountains, to Windermere. The first section of 3 miles has been started. This will give an outlet for a large quantity of ore awaiting transportation at the Lavina group, on Hammil creek. The Argenta mines propose putting in an aerial tramway to connect with the road, and a concentrator will be built on the creek.

CANADA.

ALBERTA.

The Canadian-American Coal Co. has sustained a loss of \$200,000 through the destruction of its entire mechanical plant at the Frank coal mines, and this will be increased by the loss of business for ninety days that will intervene before production can resume. Outside of this the damage amounts, in a way, to a benefit, for they will open the property in three places instead of one, and the equipment will be on a larger scale, says E. C. Spriggs of Butte, Mont., a director of the Canadian-American Coal & Coke Co. When the disaster occurred 1000 tons of coal daily were being produced, and this will be increased to 3000 tons. They will have two vertical openings to the mine in addition to the main adit tunnel from which all the coal mined to date has been extracted, reports the Rossland Miner. The openings will not be closer than a mile from each other. The seam on which they are working is 14 feet in width and vertical. The main tunnel is in 9000 feet.

MEXICO.

CHIHUAHUA.

J. C. Brooks and W. W. Bryan, of Chihuahua, have a lease and bond on the V. Primrose mine, near Parral.

Manager Sullivan, of the Chihuahua M. Co., at Santa Eulalia, has an option on the Duran mine at Almolaya, near El Valle, in Parral district. Development work has begun. The ore carries silver, lead and some gold.

L. Sanders, of Sonora, superintendent of the Santo Domingo placers, 80 miles east of Chihuahua, says operations have begun.

The San Juan mine at Santa Eulalia, belonging to the Pedro Prieto estate, has closed down.

H. Gamble, manager of the Parral M. & M. Co., says his company, composed of Toledo, Ohio, men, is developing the Cuatro de Julio mine, adjoining the Dos Republicas mine, near Parral.

A. P. Griffiths, late manager of the Palmarero mines, near Chihuahua, says the conversion of the 50-stamp mill from dry to wet crushing and the erection of the 400-ton cyanide plant have given satisfactory results. The ore, which is mostly sulphide with some gold, and averaging \$18 per ton, is crushed wet, concentrated and the tailings cyanided. The results obtained by the latter process show a total saving of 75% of the values. The total working costs have been brought down from \$23 to \$10.25 per ton, which includes the fact that ore has to be brought down by railroad 12½ miles. A 3½-mile aerial tramway to connect one of the mines with the railroad and a slimes plant are proposed. T. H. Oxnam is manager.

F. H. Husted, manager of the Terrenates Con. M. Co., of Parral, has applied for a concession to build a broad-gauge railroad from Minas Nuevas, in Parral district, a distance of 2½ miles to the mines of the company. The road is to have a third rail, so that cars of both the Parral and Durango roads (the latter being narrow gauge) can be used.

COAHUILA.

C. C. Pierce, of Laredo, Tex., reports the companies of which he is manager has 100 men at work developing some mines near Montemorelos.

DURANGO.

At San Juan de Guadalupe, La Azultla mine is being worked at depth of 350 feet, said to be the deepest in the camp.—El

Refugio mine in same district is being operated by J. J. MacTeague.

Work has begun at San Pedro del Gallo to open up the coal beds found there.

JALISCO.

W. A. Otis & Co., of Colorado Springs, Colo., have bought a group of mining claims at Mascota. One shoot has been uncovered for 120 feet and is 5 feet in width, containing 3½ feet of milling ore of good grade. The new owners are preparing to put in a plant of machinery. P. Fitzgerald, formerly of Cripple Creek, Colo., is manager.

SONORA.

The Cerro Escarlata G. M. Co. began operations last week, says the Bisbee, Ariz., Review. The group is 4 miles east of Nacoziari. They are sinking two shafts, each on a separate vein. There are twenty-six pertenencias in the group. R. O. Dillon is superintendent.

The Grand Central mine at Minas Prietas is being operated by C. A. Butters under lease.

One reason given for the closing down of the San Marcial coal mines at San Marcial is that the coal carries too much slate, thus injuring the commercial value of the product. The coal mines at Barrancas, however, owned principally by the Southern Pacific, are making a steady output.

J. Herman of Bisbee, Ariz., manager of the Alascia M. Co., near Cananea, says the company propose to erect a smelter this season.

Near La Concentracin, at the Prieto mine, La Dura M. Co. have connected their new shaft with the south workings by a drift 600 feet long at depth of 700 feet. On the 1000-foot level they are running a drift to the north workings, a distance of 1000 feet. At La Dura, 2 miles down the river from La Concentracin, the same company are operating La Gloria mine, which is also in ore.

J. P. Casey et al., of the Cananea Con. Co. Co., have the San Antonio mine of Cananea. A contract has been let for 500 feet of work, 200 feet sinking and 300 feet drifting. The main vein on which work is begun is 4 feet wide, and assays show copper 13%, silver 56 ounces and gold \$3 per ton.

Tayopa M. Co. of Los Angeles, Cal., are reported to have bought the Santa Rosalia, Cuba Libre, and Fierro Grande mines in Sierra Madre district. They are said to show values in gold, silver and lead. The Tayopa Co. will build a reduction plant.

Catalogues Received.

The Sullivan Machinery Co., of 135 Adams St., Chicago, Ill., have issued an attractive little pamphlet, descriptive of their hoists, air compressors, etc., and also of a hand operated diamond drill for prospecting purposes, as well as diamond power drills.

The American Spiral Pipe Works has issued a small catalogue descriptive of their spiral riveted pipe. The book is handsomely illustrated and shows the manifold uses to which this class of pipe may be put. It also contains valuable tables useful to those interested in hydraulics.

The A. Leschen & Sons Rope Co., of St. Louis, Mo., and San Francisco, Cal., have issued a new catalogue, No. 24, descriptive of wire ropes for all purposes for which ropes of this description are used. It also contains valuable information in the form of tables, and descriptions of Leschen's wire rope ways.

"Concentration Mills and Machinery" is the title of a handsome catalogue, No. 7 C, of the Colorado Iron Works Co. of Denver, Colo. It devotes several pages to a general description of the character and treatment of ores which may be concentrated to economical advantage, and also describes in detail the several mechanical appliances and machines by means of which concentration is accomplished. It is handsomely printed, finely illustrated and contains 95 pages of valuable information on the subject of concentration.

Obituary.

W. R. BOYKER, a pioneer miner of Placer county, Cal., died at his home near Kent, Wash., May 28, at the age of 75 years. Deceased was born in Charlotte-town, Prince Edward Island, and came West, across the Isthmus of Panama, in 1849. A widow, five daughters and seven sons survive him.

PERSONAL.

A. B. BROWNE, of Sumpter, Or., has gone to New York on mining business.

W. P. HAMMON of Oroville, Cal., is in San Francisco, Cal., on mining business.

DE W. CLARY of Stockton, Cal., is in San Francisco, Cal., on mining business.

F. H. HARVEY of Galt, Cal., has been making mine examinations near Carters, Cal.

JOHN R. TREGLOAN, mine owner of Amador City, Cal., is in San Francisco, Cal.

T. H. OXNAM is manager of the Palmarajo mines near Chinipas, Chihuahua, Mexico.

H. W. FAIRBANKS is on a geological expedition to the northern counties of California.

J. M. DYER of San Francisco, Cal., has gone to Grizzly Flat, El Dorado Co., Cal., to put up a mill.

F. FLETCHER of Trinity Center, Cal., interested in Trinity county mines, is in San Francisco, Cal.

A. H. LAZARE, manager Engineering Magazine of New York and London, is in San Francisco, Cal.

J. H. MACKENZIE of San Francisco, Cal., is at Angels, Calaveras county, Cal., on mining business.

G. MCM. ROSS, a mining superintendent of Virginia City, Nev., is in San Francisco, Cal., on business.

A. B. PAUL has returned to San Francisco, Cal., from an examination of mines in Siskiyou county, Cal.

JOHN LAWLER, owner of the Hillside mine, Yavapai county, Ariz., is in San Francisco, Cal., on business.

W. J. NELSON, who has mining interests at San Andreas, Calaveras county, Cal., is in San Francisco, Cal.

H. W. TURNER, superintendent Cherry Hill mine, near Yreka, Siskiyou county, Cal., is in San Francisco, Cal.

C. J. GARVIN of Cripple Creek, Colo., is manager of the Neglected mine, near La Plata, La Plata county, Colo.

W. L. WATTS, E. M., has returned to San Francisco, Cal., from an examination of mines in Mariposa county, Cal.

E. A. WILTSIE, of San Francisco, Cal., representing the Venture Corporation of London, has gone to Denver, Colo.

W. L. CABLE has returned to San Francisco, Cal., from examining mining properties in Siskiyou county, Cal.

C. S. OSBORN is superintendent of the Shasta May Blossom mine, in Bully Hill district, near Winthrop, Shasta county, Cal.

P. FITZGERALD is manager of a group of mines at Mascota, Jalisco, Mexico, for W. A. Otis & Co. of Colorado Springs, Colo.

F. A. GOURLEY of Nevada City, Cal., has gone to Alaska to open up a group of claims near Gollivan hay for a French company.

C. L. LANG has resigned as superintendent of the Cherokee group of mines near Carters, Cal., and has returned to Sonora, Cal.

W. SHARWOOD, owner of the Soulshy mine at Soulshyville, Tuolumne county, Cal., has returned to the mine from San Francisco, Cal.

L. SANDERS of Sonora, Mexico, is superintendent of the Santo Domingo placers, 80 miles east of Chihuahua, Chihuahua, Mexico.

N. COCHRANE, E. M., returned to Rossland, B. C., last week from a two months' visit in Scotland.

J. E. BACON of Tombstone, Ariz., interested in mines in Dos Cabezas district, returned to Tombstone last week from a trip to New York.

A. W. NELSON of San Francisco, Cal., is superintendent of the Alpine M. Co., Cable Cove district, near Sumpter, Or., vice R. Addom, resigned.

J. M. LONG, for a number of years superintendent of the Le Roi mine at Rossland, B. C., is superintendent of the Yreka C. Co. at Quatsino, B. C.

W. H. KERR, former manager of the Grant Oil Co., is superintendent of the Mount Hamilton Land & Oil Co., operating at Alcaide, Fresno county, Cal.

J. B. TREGLOAN of Amador City, Cal., has been appointed on the staff of California State Mineralogist L. E. Aubury, to do geological work in Amador county.

S. A. PARNALL, former manager of the S. A. Burrage mining interests at Terrazas, Chihuahua, Mexico, is superintendent of the Higgins Development Co. at Bisbee, Ariz.

H. G. OLIVER, superintendent of the electrical department of the War Eagle and Center Star mines, returned last week to Rossland, B. C., from a three weeks' trip to Winnipeg.

A. P. GRIFFITHS, former manager of the Palmarajo mines at Chinipas, Chihuahua, Mexico, is in London, England, and will go to China to examine mines for a South African company.

RICHARD A. PARKER, E. M., who has been at Hot Springs, N. M., for some months past for his health, has gone to Boston Highlands, Mass., for a few weeks. Later he will visit Denver, Colo.

H. W. GENDER has resigned as superintendent Metropolitan G. & S. M. Co., Ltd., of Ferguson, B. C., and taken position of manager for an Eastern company operating at Okanogan Landing, B. C.

W. H. KRITZER, E. E. for several months with Joshua Hendy Machine Works, San Francisco, Cal., has resigned, and will connect himself with the Risdon Iron Works Co., San Francisco, Cal.

G. K. FISCHER, formerly superintendent of construction of the Highland Boy and United States mining smelters, is engineer for the Newhouse M. & S. Co. of Utah, incorporated to operate the Cactus copper mines near Frisco, Utah.

J. D. SPARGO, formerly with the De Lamar Co., and until recently general superintendent of the De Lamar Gold Mountain mine in San Bernardino county, Cal., has gone from Los Angeles to Inyo county, Cal., to examine mining property.

Commercial Paragraphs.

THE Sullivan Machinery Co. of Chicago, Ill., have opened up an office in Rooms 1209-10 Missouri Trust Bldg., St. Louis, Mo., where P. F. Jarvis will have the management of the company's business.

THE Salida Gold & Copper M. Co. has placed a \$3000 order with C. Wallace of Denver, Colo., for pulverizing machinery for the new copper leaching plant, on the Sedalla property, near Salida, Co. In the order are six 24-inch Wallace sectional steel crushers. The ore passes a rock breaker before going to the pulverizers. It is claimed that the "wear and tear" of these machines will not exceed 1 cent per ton of ore treated.

PAWLING & HARNISCHFEGGER, crane and hoist builders, Milwaukee, Wis., advise that their hooking of orders is satisfactory. The many modern shops planned by railroads have resulted in a large volume of estimates for crane equipment; many of these contracts will be closed, they say, within thirty days. The steel and iron plants continue the heaviest buyers, though the demand for cranes is broadening. The old Nordberg shops, leased and equipped by Pawling & Harnischfeger to replace their erecting shops burned April 15, have placed them in as good shape to build cranes as prevailed before the fire. Among orders hooked recently are the following: American Stone Co., Brooklyn, N. Y., two cranes; Milwaukee Bridge Co., Milwaukee, Wis.; Louisville Railway Co., Louisville, Ky.; Louisiana Purchase Exposition, St. Louis, Mo.; Ingersoll-Sergeant Drill Co., Easton, Pa.; two cranes; Milton Mfg. Co., Milton, Pa.; Vilter Mfg. Co., Milwaukee, Wis.; American Road Machine Co., Kennett Square, Pa.; Stillwell-Bierce & Smith-Vaile Co., Dayton, O., two cranes; Mahoning Foundry & Machine Co., Youngstown, O.; New York Shipbuilding Co., Camden, N. J.; McConway & Torley Co., Pittsburgh, Pa.; Sterritt-Thomas Foundry Co., Pittsburgh, Pa.; Standard Oil Co. of New York, Atlas Works, Buffalo, N. Y.; Pennsylvania Engineering Works, New Castle, Pa.; Metropolitan Street Railway Co., Kansas City, Mo., two cranes; Jefferson & Clearfield Coal & Iron Co., Ernest, Pa.; International Harvester Co., Hamilton, Ont.; Gould Coupler Co., Depew, N. Y., three cranes; Helena Light & Traction Co., Helena, Mont.; American Sheet Steel Co., Pittsburgh, Pa., two cranes (one special); Allis-Chalmers Co., Milwaukee, Wis., two cranes; Howard Iron Works, Buffalo, N. Y.; American Bridge Co., Ambridge Works, Economy, Pa.; La Belle Iron Works, Steubenville, O.; Bradley Mfg. Co., Pittsburgh, Pa.; New York Edison Co., New York.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 26, 1903.

- 728,840.—STEAM BOILER—W. N. Best, Los Angeles, Cal.
729,261.—SOLDERING MACHINE—Black & Smith, S. F.
729,123.—ENVELOP—F. S. Boedefeld, S. F.
729,037.—CAR COUPLING—Bowen, Neunham & Barnett, Los Angeles, Cal.
729,138.—ATOMIZER HOLDER—J. C. Cramer, Sawtelle, Cal.
729,317.—ELECTRICAL TREATMENT—H. Fleetwood, Los Angeles, Cal.
729,333.—WOOL WASHER—Haas & Baruch, S. F.
729,162.—BOTTLE—W. B. Hargan, S. F.
728,912.—STREET LAMP—H. M. Hastings, Geyerville, Cal.
729,169.—STAMP STEM GUIDE—J. H. Hendy, S. F.
729,183.—BALING PRESS—J. Jensen, Livermore, Cal.
729,076.—FILING CASE—J. Lee, S. F.
729,215.—OIL BURNER—J. H. Morrissey, S. F.
729,392.—BINDING DEVICE—A. Newell, Pasadena, Cal.
729,025.—BOBBIN—F. J. Rabbeth, Redlands, Cal.
729,096.—FLIER—F. J. Rabbeth, Redlands, Cal.
729,232.—HEATING PAD—W. Rickards, Los Angeles, Cal.
729,475.—BOTTLE—P. J. Wilson, Ben Lomond, Cal.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDROCARBON BURNER.—No. 729,205. May 26, 1903. J. H. Morrissey, San Francisco, Cal. This invention relates to improvements in oil burners for furnaces and the like. Its object is to provide a double jet device of simple construction, one by which the flame can be directed according to the area or nature of the surface to be heated and employing a minimum air pressure to effect volatilization of the oil.

BATTERY STAMP STEM GUIDE.—No. 729,169. May 26, 1903. J. H. Hendy, San Francisco, Cal. This invention relates to a guide for the stems of battery stamps. It consists in the formation of a chamber within the guide, a piece of thick felt fitting in said chamber and having a segmental compressing spring plate fitting around its exterior and an independent spring pressing upon the back thereof, whereby the felt is held in close contact with the stamp stem and its movements.

BALING PRESS.—No. 729,183. May 26, 1903. J. Jensen, Livermore, Cal. The object of this invention is to provide a hay press of simple construction and of largely increased capacity over presses of the ordinary type. It consists in a haling press, the combination of a horizontal press box, a lower movable therein, worm shafte exterior to the box, projections on said follower engaging said shafts, said means including a drum, oppositely wound ropes or cables secured to said drum and connections between said drum and shafts whereby the latter are revolved in unison. There are other details of construction which provide an easily operated machine.

ENVELOPS.—No. 729,123. May 26, 1903. F. S. Boedefeld, San Francisco, Cal. This invention consists of a body portion of the desired shape having flaps extending from each of the four sides, these flaps having transverse foldable extensions at the ends, the extensions of the flaps being adapted to overlap and coincide when said flaps are folded in. The flap formed upon one of the longer sides has a slot made transversely in it, and the other flap has transverse extensions upon the end foldable upon each other, so as to allow this end to be inserted through the slot, and when thus inserted the transverse extensions form a lock to prevent its being withdrawn. In conjunction with this construction an adhesive cement serves to unite the flaps when folded up, so as to make it impossible to open the envelop without destroying it.

Books Received.

"Granites and Gneisses of Georgia" is the title of Bulletin No. 9 A of the State Geological Survey of Georgia, by Thos. L. Watson, assistant geologist, W. S. Yeates, State Geologist. The volume is profusely illustrated, showing the geological features of the granitic area, and gives much information of a practical kind in reference to the extensive granite quarries of that State.

"Ventilation in Mines," by Robert Wabner, translated from the German by Chas. Salter, is the latest work on practical mining issued from the scientific press. It is a monograph on an important subject, and one which is too frequently neglected by practical miners, particularly in the metal mines. The volume deals with composition of the air in mines; means of preventing the danger from contamination of mine air; means of ventilation; natural ventilation, mechanical ventilation, ventilating fans, etc. The book cannot fail to be of interest to every mine superintendent. Price, \$4.50, net. It contains numerous illustrations; 240 pages; Scott, Greenwood & Co., 19 Ludgate Hill, London, England; D. Van Nostrand Co., New York City.

Latest Market Reports.

SAN FRANCISCO, June 5, 1903.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 53½c, refined (1000 fine); San Francisco, 53½c; Mexican dollars, 42¢ @ 42½c San Francisco, 42½c New York.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50@14.75; Electrolytic, 1 to 3 casks, \$14.50@14.75; Casting, 1 to 3 casks, \$14.50@14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18¢@24c. London: £60 spot per ton.

An Eastern merchant and a close observer of the metal market is quoted as saying:

"I think producers will have no difficulty in maintaining 15 cents as the minimum price for the metal for the balance of the year, and this view is based upon the belief of some of the best judges of the metal in the world. That which has been attempted and successfully in iron and steel is coming to a focus in copper. Two of the heaviest copper interests in the world—the Standard oil people and the Rothschilds—have for some time past been working along common lines, and so far as the present selling price of the metal is concerned, practically all interests are satisfied with 15 cents, lake and electrolytic basis. I believe that between July 1 and January 1 next the consumption of copper will not fall below 50,000,000 pounds per month. I estimate the consumption of the world for 1903 at 620,000 tons, and the production will probably not exceed 600,000 tons. I place the visible supply Jan. 1, 1903, at 67,000 tons."

LEAD.—New York, \$4 37½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £11 8s 9d per long ton—2.75c per lb.

SPELTER.—New York, \$5.75; St. Louis, \$4.60; London, £20 17s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13¢@15c.

TIN.—New York, pig, \$28.50@28.75; San Francisco, ton lots, 30½c; 500 lbs., 31c; 200 lbs., 31½c; less, 32c; bar tin, \$3 35c @37½c. London, £129 spot.

PLATINUM.—San Francisco, crude, \$18.00 ½ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75¢@80c per gram.

QUICKSILVER.—New York, \$44.50@46.00; large lots; London, £3 15s; San Francisco, local, \$45.00 ½ flask of 76½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16.75c.

NICKEL.—New York, 50¢@60c ½ lb.; ton lots, 45¢@48c.

GENERAL SUPPLIES.

IRON.—Pittsburg, Bessemer pig, \$19.75 @20.25; gray forge, \$19.85; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31.50; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

POWDER.—F. O. h. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

OILS.—Linseed, hotted, bbl., 54c; cs., 59c; raw, bbl., 54c; cs., 59c; Lucol oil, hotted, bbl., 50c; cs., 55c; raw, bbl., 52c; cs., 57c. Kerosene—Pearl, per gal., 21c; Astral, 21c; Star, 21c; Extra Star, 25c; Eocene, 24c; Elaine, 27c; Water White, in bulk, 14½c; Mineral Seal, iron bbls., 13½c; wooden bbls., 21c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot oil, pure, bbl., 75c; cs., 80c; Sperm, crude,

50@60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 50@55c.

CANDLES.—Granite 6s, 16 oz., 40s., 10½¢ per set; 14 oz., 40s., 9½¢.

CEMENT.—Germania, \$2.50 @ 2.75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½¢; in 25-lb. tin pails, ¾¢ per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ¾¢ per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½¢.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25@26¢ per lb.; carloads, 23@24½¢; in tins, 35¢; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 2½@2½¢ per lb.; caustic soda, in drums, 3@4¢ per lb.; Cal. s. soda, bbls., \$1.25 @ 1.50 per 100 lbs.; sds., \$1.05; chlorate of potash, 12@13¢; nitrate of potash, bbls., 10¢; caustic potash, 10¢ in 40-lb. tins; borax concentrated, 7@8¢ per lb.; roll sulphur, 4@6¢; powdered sulphur, 2@3¢; flour sulphur, French, 2@3¢; alum, \$2.00 @ 2.25; California refined, 2@2½¢; sulphide of iron, 9¢ per lb.; copper sulphate, 5@7¢; chloride of lime, spot, \$2.50 @ 2.75; sulphuric acid, in carboys, 66% B, 2½¢ per lb.; nitric acid, in carboys, 8¢ per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$6.50 Brymbo, \$7.50; Pennsylvania, hd., \$14.00 Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½¢.

LITHARGE.—Pure, in 25-lb. bags, 8 @ 9¢ per lb.

BONE ASH.—Extra No. 1, 5@6¢ per lb. No. 1, 4@5¢.

BORAX.—Concentrated, 7@9¢ per lb powdered, 9@12¢; fused, 25@30¢.

BORAX.—Crystal, 7c; calcined, 25c.

MANGANES.—Pure, ½ lb., 60c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

BISMUTH.—Subnitrate, per lb., \$1.60.

SODIUM.—Metal, ½ lb., \$1.00.

MERCURY.—Bichloride, ½ lb., 90c.

PHOSPHORUS.—(American) ½ lb., 75c.

SILVER.—Chloride, ½ oz., 90c @ \$1.00; nitrate, 55c.

ALUMINUM.—No. 1, 99%, small lots, 37¢ per lb.; 100 lbs., 35¢; 1000 lbs., 34¢; ton lots and over, 33¢, Pittsburg. No. 2, 90%, small lots, 34¢; ton lots and over, 31¢, Pittsburg.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

A MINE SURVEYOR, AN ASSAYER AND Analytical Chemist, with a thorough acquaintance with the cyanide process and a graduate of a leading mining college, is open to engagement. The best of references furnished. Address Box 558, Los Angeles, Cal.

A YOUNG MAN WITH 12 YEARS' PRACTICAL mining experience wants position where the ability to do things and doing them will lead to advancement. Can assay, survey, run engine or pumps, sharpen tools, or do anything about a mine. Have some mill experience. References given. Address R. J. S., care of this office.

CYANIDE CHEMIST OR MILL SUPT. TECHNICAL graduate. Specialty, construction; also, successful treatment of low grade ore and slimes. Good references. Address "Spanish," this office.

EXPERIENCED ASSAYER, ANALYST AND Draughtsman desires position with mine, mill or smelter. Excellent references. Speaks Spanish. Address "Metallurgist," this office.

FIRST-CLASS METALLURGICAL CHEMIST and Assayer desires position. Can furnish best of reference, etc. Address C. W. L., this office.

FIRST-CLASS MINING AND LAND SURVEYOR, Draughtsman, etc., desires position. Address H. W. K., Box 74, Long Beach, Wash.

MILLMAN DESIRES POSITION WITH GOLD mining company to erect or take charge of stamp mill. Extensive experience gained in the treatment of ores in United States, Central and South America. Can assay and test ores to determine best method of treatment. Excellent references. Address "Aurum," care of this office.

WANTED.

WANTED--MILL TAILINGS, Gold, silver or lead, in New Mexico, Arizona or Old Mexico. Will buy or lease. Give location, quantity and value. A. E. VAN VELSAN, Telluride, Colorado. Box 181.

Wanted---A Superintendent

For foundry, forge, machine and boiler shops employing 200 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answers confidential. Address Z. P. O. box 153, Station C, Los Angeles, Cal.

MINING STOCKS WANTED.

If you are a stockholder in any good going mining company and want to sell your shares

WE CAN GET YOU CASH.

Send for our price list of 500 stocks. It tells what we will buy and what we will sell.

CATLIN & POWELL, 94, 35 WALL ST. NEW YORK.

DELINQUENT SALE NOTICE.

GOLDEN CHANNEL DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Butte County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 11th day of April, 1903, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Am't.
A. B. Paul, Trustee	13	25	37½¢
A. B. Paul, Trustee	18	2,000	30 00
A. B. Paul, Trustee	22	500	7 50
A. B. Paul, Trustee	24	1,000	15 00
A. B. Paul, Trustee	25	1,000	15 00
A. B. Paul, Trustee	52	5,000	75 00
A. B. Paul, Trustee	55	200	3 00
A. B. Paul, Trustee	57	1,487	21 55½¢

And in accordance with law, and an order from the Board of Directors, made on the 11th day of April, 1903, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 27 Crocker Building, San Francisco, California, on SATURDAY, the 20th day of June, 1903, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.
Office—Room 27 Crocker Building, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the National Cons. Mining Company will be held at the office of the company, 773 Mission St., San Francisco, California, on MONDAY, the 1st day of June, 1903, at the hour of 8 o'clock P. M. for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

GEO. W. FLEISSNER, Secretary.
Office—773 Mission St., San Francisco, California.

WILL BE INTERESTED IN THIS LETTER ABOUT

WEINLAND TUBE CLEANERS

From a Practical Superintendent of a Modern Up-to-Date Plant.

OFFICE OF
PITTSBURGH PLATE GLASS CO.
ELWOOD, IND., Jan. 5, 1903.

The Lagonda Mfg. Co.
Springfield, Ohio.

Gentlemen: Your Weinland Mechanical Tube Cleaner, which you have installed in our Elwood plant, is giving entire satisfaction with the work it is doing.

We have removed approximately about 50 bu. of scale from one of the Babcock & Wilcox boilers of 125 tubes, 18 feet long.

Our scale would average in some places in the tubes from 1/4 to 3/4 inch thick.

This machine has removed that scale successfully, both in time and labor.

We have tried in our plant about all the devices that are on the market in the way of Mechanical Cleaners, and we find that this Weinland Cleaner will do from 50% to 75% more work, with the same per cent less of repairs, than anything we have ever had.

We accepted this machine after it had been given a thorough test and are satisfied with all its details.

Respectfully,
S. E. CLARK, Supt.
Pittsburgh Plate Glass Co.
Elwood, Ind.

Note! Condition of Scale. Most Cleaners "quit" in Time of Cleaning. "hard scale." These are vital points in Cost for Repairs. which the WEINLAND excels all others.

Here's Another Style.

Our Improved No. 8 Water Power Cleaner. Extra Strong and Durable. Unequaled in this line. You'll like our hose coupling which we furnish with the cleaner—saves lots of bother and "cuss words," as hose can't pull out.

Weinland Cleaners Great Coal Savers.

Write us about Boiler Cleaning. We are experts in that line. Had twenty years' experience and "know how."

INVESTIGATE OUR LAGONDA FEED WATER REGULATOR.

The Lagonda Mfg. Co., Springfield, Ohio.

JACKSON PATENT SERIES 3-STEP CENTRIFUGAL PUMP, DESIGNED FOR 400 FT. LIFT.

A Revelation in CENTRIFUGAL PUMPS.

JACKSON PATENT SERIES HIGH PRESSURE CENTRIFUGAL PUMPS FOR ELEVATING WATER FROM 100 TO 1000 FEET OR MORE, GIVING AND MAINTAINING AN EFFICIENCY OF FROM 70% TO 84%.

These Pumps are adapted for raising water from deep shafts, hydraulicking for mining, delivering water under pressure for city water works, fire service, etc. Will pump muddy or gritty water without injury to the pump, there being no valve in the pump to wear out. Fully protected by patents. Write for Catalogue H.

Mining in Western Australia.

Within recent years Western Australia has attracted much attention by reason of the large output of the mines in that region, which includes Coolgardie field, the most important. This portion of Australia is an elevated tableland, described as being about 1500 feet above the sea, but with only slightly modified topography. The entire region, comprising many hundred thousand square miles, is one once worn down to what geologists call a "base level of erosion." That is, this portion of Australia was at one time exposed to erosive influences for a very long period, during which all the elevations were reduced in altitude to nearly the level of the sea. When this had nearly been accomplished the region began to rise and continued to be uplifted until its present level was reached. This is briefly the condition as at present understood. Throughout this vast territory, nearly 1000 miles square, are scattered the various mining districts in which are found gold, silver, lead, antimony, copper, diamonds and other metallic and mineral products. The entire region is sterile and barren, but few trees growing there naturally. Water is very scarce, as the rainfall is light and uncertain.

In sinking mine shafts in this desert, the miners not infrequently found water, but almost without exception the water was unfit for domestic or other uses, containing generally a large percentage of sodium chloride (table salt). To utilize this water, which was all that could be obtained in the region, large condensing plants were built to distill the salt water from the mine shafts for domestic uses, and for steam making. One of the accompanying illustrations is that of a large condensing plant at the Lake View Consuls mine, Coolgardie. The mines became so productive, however, that the idea of pumping water to the gold fields was taken up, and although the nearest large, available supply of water was about 385 miles distant, yet the project was undertaken and carried out to successful completion. The pipe line was finished and the first water was pumped into Coolgardie district a few weeks since. A description of this great pumping plant was pub-

Condensers, Coolgardie, Western Australia.

lished in the MINING AND SCIENTIFIC PRESS of May 2, 1903. The main line is 387 miles in length, of steel pipe 24 feet in diameter. There are along the line twenty stations and sixty-five pumping engines. This great hydraulic system was designed and built to supply the mines with water, at a cost of nearly \$15,000,000. When the mines are worked out the pumping system will have outlived its usefulness. The present capacity of the system is 5,000,000 gallons daily, which is considerably more than the mines require at this time, but the Government has wisely anticipated this demand.

Owing to the level character of the district about

Coolgardie, dumping ground is difficult to obtain, and the problem of caring for large amounts of tailings has been ingeniously solved by the building of steel towers connected by ropeway. The tailings are hoisted in a bucket carried along the wire tram and dumped whenever desired, as shown in the accompanying picture. Both illustrations on this page are from the report of the Department of Mines for Western Australia for 1901, and their use made possible herein through the courtesy of H. S. King, under secretary of mines for Western Australia. At present the superfluous water will be employed in irrigation.

Additional Labor Troubles.

A week ago the difficulties which had been anticipated between the mine operators and the Union miners in Arizona did not bear a very threatening aspect, but this week finds that Territory the center of interesting complications, and the outlook in the southeastern part of the Territory is not at present reassuring. About Clifton and Morenci, neighboring towns in Graham county, it is reported 3500 miners are out on strike, and their attitude is described as threatening, so much so that the Territorial militia have been ordered to these camps, and the peace officers are doing all in their power to prevent destruction of life or property. When the Territorial eight-hour law went into effect June 1 the management of the mines offered nine hours' pay for eight hours' work. This the miners refused, demanding the same wages as had been previously paid for ten hours. The strikers are said to be mostly Mexicans and Italians, of a class difficult to restrain when excited.

At Searchlight, Nev., trouble has occurred and all the mines were closed a few days since, owing to the miners striking at the Quartette mine. The Nevada Legislature also passed an eight-hour law at their last session, but the law was made to affect only underground men. When on the 1st of June the law went into effect, the Quartette Co. announced that it would require top men to work nine hours, as they were not included in the eight-hour law. Upon receiving notice to this effect, the Union called a strike and all men employed by the Quartette Co. quit, including railroad engineers and mill men, only pump men being allowed to remain to keep the mine clear of water until the strike is either settled one way or another. It is understood that only three men are affected by the determination of the company, but the other companies in the camp have also closed down, anticipating similar trouble. Arbitration has been suggested and it is not unlikely that a satisfactory agreement will be reached.

At Randsburg, Cal., the Miners' Union made a demand a week ago at the Yellow Aster mine for \$3.50 for miners and \$3 for muckers. This demand was refused by the management, who further stated that it would no longer recognize the Union. In consequence the miners struck. The Yellow Aster is the largest

and most extensively developed mine in the Randsburg district, and has a large stamp mill. The mine is perfectly dry, and little or no damage is likely to occur as a result of suspension of operations. In view of this fact it may be expected that an adjustment of the trouble in that district will not be speedily reached. The management claims that the company has been paying higher wages than in most other California districts, and will entertain no proposition to increase pay of either miners or muckers.

Record of Annual Labor Unnecessary.

The United States mining laws, while not perfect, are in the main just, clear and equitable; but State and local laws made to govern the conduct of mining business and to secure title to mining property are not always as comprehensible as may be desired; moreover, some of these laws are not wholly in accordance with congressional laws, and in some instances have a tendency to usurp prerogatives of Congress. Several States have passed laws requiring the recording within specified time, with the county recorder, an affidavit of annual assessment work, and this sworn statement of labor actually performed, or expenses made for the benefit of the claim, shall be prima facie evidence that the labor has been performed or the improvements made, as claimed. In no instance, however, is it clear that a forfeiture follows a failure to record the work performed or improvements made. The States having such laws are Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Washington, Wyoming, Arizona and Arkansas.

A law was passed by the California Legislature March 31, 1891, which required that proof of annual labor be recorded, but the law is not at all clear that failure to so record the labor shall work a forfeiture. The proof of the labor is a secondary consideration. The United States statutes require that \$100 worth of labor be performed annually, and this is the main thing, and where the labor has actually been performed, or improvements made as required by the statutes it is likely in most instances that proof could be easily made that the labor had been performed, which satisfied the requirements of the United States statutes. Moreover, it is extremely doubtful if the courts would sustain any State law making forfeiture the penalty for failure to record labor actually performed.

In Tuolumne county, Cal., several persons are reported to have recently jumped the Deadhorse mine, one of the old and noted mines of that section, for the reason that the owners, who several months ago closed the mine and removed a portion of the machinery, have failed to record labor performed in 1902. Under the United States law, the mine, which is unpatented, would not be subject to relocation until Jan. 1, 1904, and not then if the owners recommenced work on the property before that date and continued it until the necessary amount of work had been accomplished. There still remains on the property a 20 stamp mill, cyanide plant and several buildings. The mine has been extensively developed to a depth of 1700 feet.

THE manager of a mine should have a knowledge of the details of all operations, mechanical and otherwise, carried on under his direction, but it is neither essential nor expedient that the manager should undertake the actual manual labor which he employs others under him to perform. Knowledge of detail is important, but the performance of these details by the manager is not good business, any more than it is economy to have the \$4 or \$5 a day mechanic carrying lumber while the \$2 man looks complacently on, willing he should do it. The duties of the manager are eminently those of general planning and supervision, the details being left to the direction of his lieutenants—the heads of the various departments. The time of a mine manager is too valuable to be spent in pushing a car, mending a refractory machine, or shoveling sand to make concrete, and the wise and experienced manager will attempt neither of these, but he should know how many cars a man will tram a shift under existing conditions; how many tons of rock or ore a mucker should shovel in a shift; how many feet of ground should be drilled by hand or with machine in a stated time.

The Iron Ore Supply.

There has been some anxiety expressed as to the future supply of iron ore. That this question should be viewed with much concern for many years to come is not suggested by the present condition of the iron industry nor by the outlook for the future. There are great iron mines operated in various parts of the United States, the largest and most notable being those in the vicinity of Lake Superior, in Michigan, Wisconsin and Minnesota. There are still hundreds of millions of tons of first-class iron ore still available in that region, and it is not unlikely that other great deposits as yet unknown will be found. It is true those deposits most easily discoverable and worked have probably mostly been found, but in the great forests, and beneath the glacial drift which covers a large portion of that region, it is more than probable other deposits will be discovered which would add enormously to the iron output of the United States. Moreover, there are hundreds of millions of tons of the so-called "low-grade ore" in the mines now working which later will become available, though considered of little value at this time in comparison with the richer ores of those great mines. There are other large deposits in the Southern and Western States which in time will supply large amounts of fine ore. It is true that in this day many of these deposits have relatively small commercial value, or none at all, owing to the cost of mining, transportation and reduction of the ore to metal, but the advance of scientific knowledge and changing conditions may be trusted to equalize these differences. In other countries there are vast deposits of valuable iron ore. Mexico is said to have numerous large deposits, some of which are known to be of superior quality. South America may also become an important factor in the iron industry in time. In Central Africa, particularly in the Congo State, there are large deposits of fine iron ore. The natives for many years have utilized these deposits, smelting the ore in small primitive furnaces in the ground and employing the metal in the manufacture of weapons, ornaments, etc., at the production of which they are expert workmen.

Another factor in the production of the iron of the future is the probable substitution of some other metal for iron and steel. In seeking for the possible substitute, one looks naturally to aluminum, though at its present price it is used in structural work, to a very limited extent, but when considering the constantly increasing knowledge of its occurrence and production, even within the past ten years, one may hopefully anticipate a much greater reduction in the future. In bringing this about the electrical furnace must necessarily play an important part. The character of aluminum fits it for many uses in which iron and steel are now employed. Moreover, aluminum is one of the most abundant elements known. As a silicate, its most common form, it is found everywhere; nearly all rocks contain it in the form of feldspar, and every clay bank is a mine of it, but at present only a few of its ores are commercially valuable by reason of containing a high percentage.

As to the future of the iron supply there need be little apprehension for many years to come, but when that time arrives, science will have been able to provide a suitable substitute for many of the uses to which iron and steel are now put.

Co-operative Mining.

At Park City, Utah, it is stated that a movement has been started to form a co-operative mining company, the stockholders and operators all being miners and members of the Western Federation of Miners. A company already organized, and known as the Aristocrat Mining Co., has offered a large block of stock for sale to the members of the union, offering as a premium 20,000 shares after 50,000 shares have been subscribed. Should the union accept the proposition they would have a majority of the stock and consequently control of the mine. This is somewhat of an innovation with labor unions, as in this case they would become operators as well as workmen. It will afford them a good opportunity of showing how financing a mine and practical mining should be done. If the proposition of the Aristocrat M. Co. is accepted the career of the company under the new management would be watched with interest.

CONCENTRATES.

THE weight of coal equivalent in heat production to one ton of dry wood is figured to be 836 pounds.

AN acid-proof cement that will withstand a high temperature might be made of litharge and glycerine.

THE nugget-like rock sample from Vulture, Arizona, is galena (sulphide of lead). It is covered with a film of carbonate and sulphate of lead, due to oxidation.

AT an elevation of 5000 feet above the sea the reading of the vacuum gauge of the condenser of an engine, back pressure four pounds per square inch, would be 16.62 inches.

THERE are in operation on the Witwatersrand 6325 stamps, the largest number being operated by the Rand Mines Co., which have 1240, and the next largest number being owned by H. Eckstein & Co., who have 1085.

SOUND will travel through steel at the rate of 15,470 feet per second; through iron, 16,822 feet; fir wood, lengthwise the fiber, 15,218 feet; white pine, 17,260 feet; air (15° C.), 1120 feet.

THE strongest explosive power of gasoline vapor is made by a mixture of one part vapor to eight parts air; of crude oil illuminating gas, one part gas to six parts of air.

THE addition of a small quantity of ferrovanadium has the property of raising the tensile strength of mild steel by from 50% to 66%. In some instances as small as .025% has doubled the tensile strength.

THE METRIC TON is nearer in weight to the English long ton of 2240 pounds than the American short ton of 2000 pounds. The metric ton contains 2204 62 pounds, and in the metric system is equivalent to 1000 kilograms.

THE rock specimen from Mazama, Wasb., appears to be a fine-grained quartz-diorite. The feldspars are much altered, but the structure and general appearance of the rock indicate that the above classification would be proper.

IN Siberia there are copper mines that produce beautiful compact masses of malachite, carbonate of copper ore. Such is the beauty of these minerals that they are polished and sent to market to be used for decorative purposes, such as table tops, mantel pieces, vases, etc.

THERE are said to be in use in the Joplin, Mo., district over 1000 machine drills, and in all the mines of the State over 1500. These are used in all the operations of mining, including shaft sinking, driving levels, putting up raises, stoping, and in almost every place where hand drills are ordinarily used.

GALENA (sulphide of lead) is slowly attacked by cyanide solutions, but all of the contained sulphur combines with cyanogen to form sulpho-cyanogen, a harmless compound, and lead comes into solution combined with that radical. There is no remedy known which will quickly relieve headache produced by nitrous oxide.

IRON ore occurring in veins may be located in the same manner as other veins or lodes, but when occurring in a flat sheet or as a superficial deposit may be located under the placer laws. A placer claim contains twenty acres, and a full lode claim, 1500x600 feet, contains about 20.65 acres. Claims located as placers have no extralateral rights, however.

A BARBED WIRE FENCE may successfully be used as a telephone line for a distance of 5 miles or a greater distance. No batteries are required other than those already in the telephone boxes. If the wires are insulated on china knobs, the result will be more satisfactory, as, unless this is done, in wet weather it is often impossible to carry on a satisfactory conversation, owing to loss of electricity.

DOUBTLESS the ore contains the metals in the proportion stated, but the smelter can not be expected to produce results in exact accordance with the assayer's certificate, as that institution might in an attempt to separate them lose three times what could be secured in treating the ore for the gold, silver and lead alone. No smelter cares to have much to do with "antimonial gold ore."

AN important discovery of minium (red oxide of lead) was recently made in the mine of the Progressive Mining & Development Co. at Leadville, Colo., W. L. Cooper manager. The mineral is found only massive and is deep red, with yellow streak. Its rarity makes it an important ore of lead, yet because of its limited production it has a value in the mineral cabinets and choice specimens are eagerly sought.

THE big garnets imbedded in schist and coming from Ft. Wrangel, Alaska, make the most interesting of any garnet specimens. These specimens come with a half dozen or more other fine big garnets imbedded in the

schist, and when some of the rock is cut from around the garnets, the garnets set out, making a most attractive and valuable mineral specimen. Such a specimen will bring several dollars and they are always in demand.

ONE GALLON of fresh water weighs 8½ pounds. One cubic foot of water contains 7.4805 gallons and weighs 62.37907 pounds. For convenience of computation, a cubic foot of water contains 7½ gallons and its weight is taken at 1000 ounces, or 62½ pounds avoirdupois; 320 gallons of water weigh one ton of 2000 pounds and measure 42 8 cubic feet. The water (320 gallons weighing one ton) would fill a cube measuring 3 feet 2 inches for each of its three dimensions.

MONAZITE occurs in granitic and gneissoid regions. It is found often in flattened or elongated crystals, often in rolled grains; color, hyacinth red, clove brown, reddish or yellowish brown; subtransparent to translucent; gravity about 5; hardness, 5 to 6.5; will not scratch glass readily; may be sluiced and caught in riffles the same as grains of iron. Sluices should have a low grade, or the greater part of the monazite is likely to escape, particularly if other heavier minerals are also present in the alluvial deposit. It occurs abundantly in North Carolina.

THE velocity of a stone dropped is zero at the start; at the end of the first second the stone is falling at the rate of 32.2 feet per second; at the end of the next second its velocity is 64.4 feet; at the end of the third second, 96.6 feet, and so on. The distance the stone falls in the first second is just one-half of the velocity it has attained, or 16.1 feet. To find the distance in feet that the stone will fall in any number of seconds, multiply 16.1 by the square of the number of seconds. Thus, in six seconds the stone will fall 579.6 feet.

THE zinc mineral smithsonite (zinc carbonate) occurs in a number of colors—white, grayish, greenish, brown, and sometimes blue and light red. The smithsonite from Laurion, Greece, are by far the finest specimens in the world. The Field Museum of Chicago owns what is doubtless the finest specimens in this country, coming from Greece. It is of a beautiful grayish color, and velvety. The United States produces smithsonite in some quantity, particularly in Arkansas, New Mexico and Virginia, but fine specimens are a rarity.

PROBABLY the finest specimen of yellow crystallized wulfenite ever produced was taken out of the Organ mine, in the Organ mountains, New Mexico, a few years ago. This specimen was exhibited at the meeting of the American Mining Congress at Milwaukee in 1900. It subsequently was bought by a Chicago man, who cut it into two pieces, the Field Museum of Chicago now owning the larger section, and Dr. Fargo of Los Angeles, Cal., is the possessor of the smaller. The crystals are of deep yellow, and with edges sharp and thin. In both of these specimens the crystals are embedded in a geode-like cavity and the bunches of crystals produce a brilliant effect.

FOREIGNERS can become, according to the law, owners of real estate in Peru, subject to the same duties, benefits, and rights as the natives. The code of mines, promulgated July 6, 1900, grants to all persons the right to obtain mining property and to be members of the boards of representatives. The number of concessions demanded should not exceed sixty. The greatest industrial development of Peru lies in its gold, copper and silver mines, its deposits of petroleum, and its mineral water sources. The mines belong to European and North American syndicates, which are engaged in vigorous prosecution of the works, so that a great output is expected for 1904 and the following years. A tax of 15 soles (\$7.30) must be paid every six months for each concession.

THE finest calcite crystals in the world are found in and about Joplin, Missouri. Crystals of enormous size are mined in the lead and zinc properties. Some of the finest specimens ever taken out have come from the John Jackson and other zinc mines in Chtwood Hollow near Joplin. From one of these mines there was recently extracted some exquisite specimens of calcite showing a fine deep amethyst shade far clearer than any other recent find and making most valuable specimens. The collection of calcites owned by the Field Columbian Museum of Chicago is the finest of any collection in the country, specimens of calcite from all over the world being represented. This collection comprises a hundred or more specimens.

CONCERNING the existence of a lode within a placer claim, Lindley on Mines says, Sec. 781: "Where a location of a vein or lode has been made under the law and its boundaries have been specifically marked on the surface so as to be readily traced, and notice of the location is recorded in the usual books of record within the district, it may be safely said that the vein or lode is known to exist, although personal knowledge of the fact may not be possessed by the applicant for a patent to a placer claim. The information which the law requires the locator to give to the public must be deemed sufficient to acquaint the applicant with the existence of the vein or lode; but a valid lode location can only be predicated on a discovery of a vein of quartz or other rock in place carrying valuable deposits sufficient to justify the expenditure of time and money for its development, and

such discovery must be shown before the location notice or its record will possess any force as against a placer patent." Where the owner of a placer claim discovers a vein within the boundaries of his claim he should secure the vein together with the extralateral right by making a lode location on the vein.

THE silicate of copper diopside is an exceedingly rare mineral, its occurrence in the United States having been limited to date to one small find at Clifton, Arizona, and that but a poor specimen. Diopside is considered by many to be the most beautiful of all copper ores, and this claim is substantiated by those who have access to some of the big mineral collections. The French Congo region of Africa is the only district that has produced diopside specimens in any amount, the specimens coming from there being of a beautiful emerald green color and crystallized in six-sided prisms, these crystals being at times quite transparent. Other localities in which diopside is found are Chile and Siberia. It is sometimes called emerald copper. Diopside specimens are rare, and to obtain a really fine one may take a collector years, as but few choice specimens come into market. Its composition is silica 38.2, cupric oxide 50.4, water 11.4; hardness 5 and gravity 3.28.

THE standard unit for flowing water in Montana and some other States is a solid or cubic foot of water, moving at the rate of a lineal foot in one second of time. Each foot in length of a flume 1 foot wide and 1 foot high (inside measurement), flowing full of water, would contain a solid or cubic foot of water. If this flume was placed on such a grade that the average rate of flow of water within it would be just 1 foot of distance for each second of time, it would carry a volume equal to the standard unit. This is often abbreviated into the two words second-foot. In considering this standard for flowing water, it is not to be concluded that a volume of a certain definite size is necessary. A flume 6 inches wide and 6 inches high, full of water flowing at the average rate of 4 feet per second, should also deliver 1 cubic foot per second. In general, the flow of any stream may be obtained by multiplying the width and depth of the water channel in feet by the average rate of flow in feet.

ZINC is a preventative of galvanic action in boilers due to the use of water containing acids—such, for instance, as salt water. It has also been found to be a preventative of scaling. In preventing the galvanic action the corrosion of the steel plates is lessened, for the zinc becomes the ultra-positive element as compared with the iron. The principal need to observe in placing zinc in boilers is to have a metallic contact between the iron and the zinc. The zinc can be introduced in the form of plates, and should be distributed throughout the boiler within the water space. It is not considered good practice to place it directly over plates in contact with the fire, for the oxide from the zinc dropping on these surfaces might cause overheating. In water tube boilers, thin narrow strips of zinc coiled around a mandrel, to form a helix, may be conveniently inserted in the tubes. As a rule, about 1 square inch of surface of zinc is used for every fifty pounds of water in the boiler. The zinc should be renewed every four months.

TWO STYLES of tailings samplers are in use and either of them is of value and practical utility. One works on the principle of the common rotary lawn sprinkler, the other is a device which automatically takes a sample from the foot of the amalgam plates below the battery. The former is operated by the force of the escaping stream of water. The tailings, collected from one or more batteries, are conducted to a hopper above the sampler. An upright iron pipe is fitted at the lower end with horizontally diverging arms, usually four in number. Three of these pipes are turned backward slightly, and the fourth has a downward discharge opening. The force of the escaping tailings drives the sampler around in the same manner as the familiar lawn sprinkler, the tailings being thrown outward from the center from three of the pipes. That from the fourth is discharged downwardly. A covered bucket is set directly beneath the circular path of the latter, the cover being provided with a slot, so that with each revolution of the sampler a small quantity of the tailings falls into the bucket beneath. At stated intervals the bucket is emptied and its contents dried and assayed. The second style of sampler is also an automatic device so arranged that a trough having a length equal to the width of the plate, at regular intervals passes beneath the lower lip of the plate, the entire stream of tailings falling into the trough for a moment. The trough, made of Russian iron plate, has an inclination to one side, and the tailings run out into a bucket or other receptacle set to receive the sample. The device may be operated by the power driving the mill, or it may be made to operate automatically by having an "over-balance" attachment which operates upon a small box becoming filled with water. When this occurs the sampler trough moves forward, and the water discharging from the "over-balance" at the same moment the trough recovers its original position. This device may be made to work as fast or as slow as desired. In milling each battery should be provided with a separate sampler, as there is often much difference in the ore passing through the respective batteries, due usually to the uneven distribution of fines and coarse rock in the mill bins. In some mines the fine rock is the richer, as at Cripple Creek, and in others it is poorer, as in some California mines.

Head-Works Framing.

Written for the MINING AND SCIENTIFIC PRESS by
CHARLES H. FITCH.

A vertical load upon two struts, as shown in Fig. 1, is divided between them. A vertical load upon a single inclined support creates a stress in the support greater than the load in the ratio of the length of incline to length of vertical, as shown in Fig. 2, and there will be an unbalanced force tending to push out the foot of the strut. A vertical load on two inclined struts is divided, and each half load creates a stress in its strut increased over the half load in the ratio of incline to vertical, as in Fig. 3.

But suppose that there was considerable variation in the inclination of the struts. By rigid rule, the effect would be a much greater stress in the longer strut. In a perfectly rigid system the longer strut would take such a stress, but all materials are elastic. If the longer strut was of rubber it would yield, and practically the entire load would come on the shorter strut. (See Fig. 4.) This would require a small force to be exercised horizontally to prevent the foot of the strut from moving. This horizontal component should be small, as shown in Fig. 5. We have already considered such a stress as being met by two horizontal framing pieces at right angles, in which case the stress as a diagonal is resolved into components in the directions of the framing pieces,

pendicular to this diagonal will cut the lines of framing and may be considered their base line, similar to the horizontal lines in Figs. 3 and 4.

The usual head-works frame is a tower, rectangular in plan, with posts vertical or having a slight batter, and, to meet the pull of engine upon the hoisting rope, a pair of inclined struts are patched on, like an afterthought, as indicated in Fig. 7. Sometimes, in place of the tower of four posts, a side or frame of two posts nearly vertical is used, and a pair of inclined struts is framed to these, as shown in Fig. 8. Another construction is shown in "perspective" in Fig. 9. This has two sides, each of three inclined posts, and admits of easy calculation of stresses and great strength for a given weight of lumber. A pyramidal form gives great strength, and a tripod will equalize stresses and so distribute the load, giving every post a share of the duty. A four-legged structure, like a four-legged stool, may bear only on three legs. We see, therefore, that the triangulation of forces by which stresses can be theoretically calculated for three members meeting at a point is a natural limitation, not an empirical one.

Referring again to Fig. 6, when the load is being hoisted the framing may be so disposed as to bring equal stresses upon the elements D-F and D-G, or, if D-G be shortened to obviate the use of long timbers, the greater stress may come on D-G.

It will not do to theorize on assumptions of absolute rigidity, because the piece which, by reason of length, weakness of bending or compressibility, yields

stresses tend to take most of the load, because they are most compressed and have a more rigid bearing. If, as shown in Fig. 11, we have a load concentrated at Q upon a steel rod, P, surrounded by a post of wood, concrete or other material, the rod would take most of the stress. The material about it would take a little, just enough to keep the rod P straight, and sometimes in compression, sometimes in tension, on either side of any vertical plane as vibrations passed through the structure. A rod, R, bowed out of line of stress would not take much load, and would create a bad reactionary load against its abutments.

Referring to Fig. 12, the load Q would bear almost entirely on the vertical center strut and little on the inclined struts. East or west winds, as indicated in plane of drawing, would produce tensile or compressive stresses in these members, however, and would render necessary either struts or else ties, such as the guys of a derrick or smokestack.

The cross timbers of a head-work are to be considered in the same way. Guys in tension might be substituted for them if the tension was carefully maintained.

Given the direction of a force, and the direction of the timber to resist it, we can see at a glance how much out of line the latter is, and the stress will be the greater the more the directions vary in a ratio determined from tables of angular functions, provided that there is no more direct member to take the stress and relieve the indirect member from the excessive stress that would otherwise come upon it.

But even if a man be innocent of trigonometry, or

Head-Works Framing.

the stresses in these being proportional to the sides of a right-angled triangle of the diagonal specified. In the inclined strut, as shown in Fig. 2, friction would prevent movement within the angle of repose, which varies with different substances under different conditions of pressure and lubrication.

The careful reader will here perceive a great discrepancy in rules. If the frame be perfectly rigid, the stress on the longer strut will be very great, and if it was raised until this strut was horizontal, it would become theoretically infinite. As a matter of fact, however, the shorter strut takes the whole load, with such assistance from the longer strut as is represented by a component of the stress in the shorter strut, indicated by the short horizontal line in Fig. 5. Therefore, referring to Fig. 4, the longer strut does not require to be heavy to resist a stress represented by A-C, but only light to resist a stress represented by A-B. In other words, the short strut takes a stress not equal to half the load, but more than equal to the whole load. It is compressed until nearly the whole load comes upon it, and creates in its oblique position a stress greater than the whole load. The longer strut is only compressed enough to take up a small component of this stress in the line of its direction.

Usually a hoisting engine is located to one side of the shaft, and the combined load of weight of superstructure and weight hoisted and pull on rope from engine is in some such direction as DE in Fig. 6, and is considerably greater than the weight hoisted. Neglecting the weight of superstructure, the direction of thrust is obtained by bisecting the angle made by lines of hoisting rope, and its force by projection completing a parallelogram and obtaining a diagonal D-E, such that vertical is to diagonal as load hoisted is to stress in direction D-E. Any convenient per-

most, will not take its due load, and the pegs, so to speak, will be knocked from under the legs of our theory.

Square or rectangular towers used, as they often are, for bins, and of no small weight themselves, have the effect of buttresses. They draw in or make less oblique the resultant load on the structure, making it more stable as well as providing storage space. Wind stresses have to be considered; but there is no difficulty about figuring these, as we can calculate them separately for the various members and simply add the stresses together algebraically—that is to say, get the grand difference of stresses in contrary directions due to all forces.

The cross braces are calculated by the triangular method, as has been described. They provide against wind pressures and buckling of posts. If a frame standing east and west, as in Fig. 10, was subject to a west wind, N-O would take a compressive stress and L-M would be a tie in tension. With an east wind, N-O would be in tension and L-M in compression.

If we have more than three members of a frame coming together at a point, some approximate assumptions must be indulged. Additional members may be placed so as to stiffen the frame, and be impossible of exact theoretical calculation or involve us in more complication than is worth while. We may figure such framing, neglecting some of the less important of these members, and may "use our judgment" in supplementary calculations to approximate their value.

"Using our judgment" may be objected to as a vague term. A critic may say: "Supposing we have no judgment, what can we do that is fairly correct?" I mean by using our judgment that we are to recollect that the struts in the direct line of

means of calculating triangles of forces, he can use some judgment—more than we sometimes see in mining structures. He can make an allowance for indirection about proportional with the length of the strut, compared with length of a strut in direct line of thrust. He can figure on about the square inches of lumber to take his load safely for posts braced at ordinary intervals, increasing the area for indirection. In this exercise of judgment he can save material. He will not put up a bastard or non-calculable structure unless the conditions are peculiar, such as the necessity of using a lot of small material. But if he was obliged to put up a structure with as many ribs as a wigwam, he would simply get them to bear as evenly and as close to the direct line of load as practicable and increase his factor of safety.

Iron Ore in North Carolina.

"Iron Ore Deposits of the Cranberry District, North Carolina-Tennessee" is an abstract from the descriptive text by Arthur Keith of the Cranberry Geologic Folio, just published by the United States Geological Survey. Deposits of magnetic iron oxide occur along a line passing through Cranberry in a northwestern direction. They begin near Old Fields on North Toe river and extend, with small intervals, south of Smoky Gap through Cranberry and on to Shell creek in Tennessee. The ore has long been worked and produces iron well known for its purity. At the Cranberry mines open cuts have been made at intervals over an area 900x300 feet and to the depth of 250 feet, with branching tunnels running in for considerable distances. The ore occurs as lenses dipping southwest. The ore is very free from phosphorus and sulphur. It yields an average of 42% to 46% of iron. The quantity of ore is more or less un-

certain, though the deposit has apparently a length of over half a mile. Large quantities are now in sight, and a large output is to be expected in the future.

Red hematite is found in this area on the east side of Bull Ruffin mountain. Little work has been done in the development of the ore, and its value and quantity are questionable. Specular hematite is found along the south slope, and also north and north-west of Beech mountain. The veins are small or of only moderate thickness. Brown limonite ores are abundant in the Tennessee district.

Mining in Bendigo.*

NUMBER II.—CONCLUDED.

Written by L. A. SAMUELS.

The diagrams Nos. 1 and 2 show the method of deepening the shaft in hard sandstone below 950 feet. Fig. 1 shows plan of shaft bottom and position of bores. Fig. 2 is a longitudinal section of bottom and lower portion of shaft, showing depth and direction of boreholes against the bedding planes of the strata,

FIG. 1.

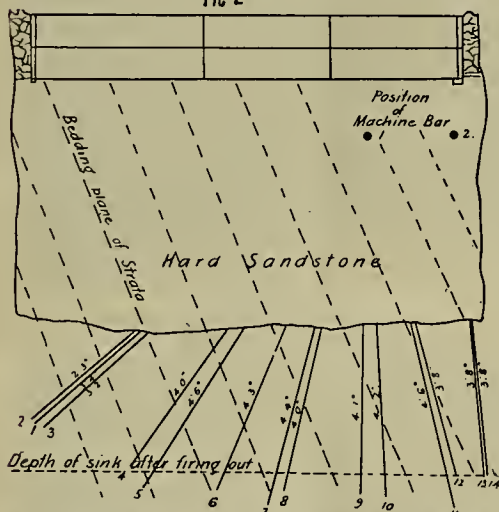

FIG. 2.

the shaft being sunk at right angles to the latter. The positions of machine bar, which are also of importance, are also shown. Bore Nos. 1, 2, 3 are called the "sink" holes. For boring these, the machine is placed under the bar in position No. 1. This is done for the purpose of providing as much of a "lift" to these holes as possible. The other bores are called stoep holes. For bores Nos. 4 to 12 inclusive, the machine is placed over the bar, which is shifted to position No. 2 for bores 13 and 14. The depth of each of the fourteen bores as shown in diagram is as follows:

	Ft. In.		Ft. In.
"Sink" holes, No. 1...	3 4	"Stoep" holes, No. 8...	4 0
" " " " 2...	3 3	" " " " 9...	4 1
" " " " 3...	3 3	" " " " 10...	4 2
"Stoep" holes, " 4...	4 0	" " " " 11...	4 6
" " " " 5...	4 6	" " " " 12...	4 8
" " " " 6...	4 3	" " " " 13...	3 8
" " " " 7...	4 4	" " " " 14...	3 8

Total length of bores—54 feet 7 inches.

Result of firing is the deepening of shaft by 3 feet 6 inches, and, as the rough area of shaft is fully 11x5 feet, there is a displacement of not less than 192 cubic feet of solid rock. Time occupied from beginning to completion of this work is twenty hours.

To accomplish this, only one drill is made use of at a time, as it is found that the use of two drills at once in a shaft of this size is unprofitable. But this drill is kept constantly going, except when firing takes place, and even then it is kept in position ready for starting again, as in the position which it occupies it is extremely seldom that it receives damage through blasting, and the loss of time and labor of removing the same and replacing it in position is thus avoided.

In each shift two shaft men are engaged to work the drill and perform the blasting. Besides these, there are two other men fully occupied in bottom, sending up mullock and water to the bottom plat, which is never more than 200 feet above them. These men also attend to tools and other requirements.

As soon as the three sink holes have been drilled the required depth they are fired, and drilling of Nos. 4 and 5 holes is at once proceeded with. While these are being bored the sink is cleared of mullock,

broken by the first three holes. After this, Nos. 4 and 5 holes are discharged, and in this manner the process is repeated until the bottom is squared up, after which the next sink is taken in hand and completed in the same manner.

In the plat above, one winchman is engaged in each shift and one lander or platman. The latter, receiving the mullock from below, trucks it and sends it to the surface. He also lands the water which flows into a cistern, from which it is raised, either by a tank or by means of a pump, to the main pump which discharges it at the surface.

The timbering of the shaft occupies, on an average, from four to five shifts at the beginning of each fortnight, according to the depth of timbering required. During this time no other work is being done in bottom of shaft. This is closely timbered, and centered or divided, with 2-inch sawn red gum slabs. A thickness of timber of 2 inches is considered quite sufficient in the hard Bendigo strata, except where, in a few isolated cases, the ground is subject to swelling, stouter timber is used.

The quantity of explosives, in the form of gelignite, used in the fourteen bores as described, was as follows:

Weight of cartridges used—1.6 oz. each. Ten cartridges weigh one pound.			
No. 1.....	8 cartridges.	No. 8.....	12 cartridges.
" 2.....	9 " "	" 9.....	12 " "
" 3.....	9 " "	" 10.....	12 " "
" 4.....	10 " "	" 11.....	14 " "
" 5.....	14 " "	" 12.....	12 " "
" 6.....	7 " "	" 13.....	12 " "
" 7.....	12 " "	" 14.....	12 " "

Total—155 cartridges. Weight, 15½ pounds.

The detonation is effected by means of electricity or time fuse. Some miners prefer the one method and some the other. As a rule, however, when the shaft is a considerable depth below the bottom plat, to which the men must proceed when firing, they are compelled to use only electric detonators.

The length of fuse required for the 54-foot length of boring may be put down at three and one-half coils of 24 feet each.

It will be seen now that to arrive at an estimate of the approximate cost of underground work per foot of sinking, on the above basis, is comparatively easy, and may be put down as follows:

Wages—			
One shaftman (foreman) at 9s 2d per shift, 2½ shifts.....	£1	2	11
One shaftman at 8s 4d per shift, 2½ shifts.....	1	0	10
Two men at 6s 8d " ".....	1	13	4
One platman at 6s " ".....	0	15	0
One winchman at 5s " ".....	0	12	6
	£5	4	7
Explosives—15½ pounds gelignite, at 1s 14½d.....	£1	1	3
Fuse—¾ coils at 7d.....	0	2	0
Candles—¾ pound per man per shift—7½ pounds at 6d per pound.....	0	3	9
	£6	11	7

Representing the expenses for 20 hours, or 2½ shifts, during which time 3½ feet have been sunk, or at the rate of per foot.....£1 17 9

To this has to be added per foot—

Timber—75 feet super red gum, prepared and milled, at 12s 6d per foot.....	0	9	4½
Cost of timbering per foot.....	0	4	6

Making a total underground cost per foot...£2 11 7½

This amount is, of course, considerably increased by surface and other expenses, steel, tools, etc., which may be safely put down at another £2 per foot. In the case under notice, no other work being in course of progress at the mine during the time of sinking, the actual cost, inclusive of all material, tools, surface expenses, management and office, was slightly over £3 10s per foot, but the fact must not be lost sight of, that a substantial saving was effected through the winze forming part of the shaft for a distance of 250 feet.

As has already been pointed out, a considerable amount of crosscutting is necessary at greater depths in the Bendigo mines, and, both in shaft-sinking and crosscutting, the mine managers on this field have displayed a healthy emulation to hasten the progress of such work where it is in hand. Crosscuts, about 5 feet wide by 8 feet in height, have frequently been driven from 60 to 75 feet per fortnight in hard ground, but it must be said that the system in vogue for this work, by boring out a face with twenty to twenty-four holes, has frequently been the cause of miners using quite an inordinate amount of explosives, "burning out the ground" as it is, not inaptly, termed.

Much unnecessary boring is avoided, considerable expense is saved, and better results are obtained by another method which has, in some cases, been adopted.

This necessitates the boring of only seven, and, in very hard ground, nine holes, in order to displace a face from 3½ to 4 feet in thickness, and as much as 92 feet of driving per fortnight has been done by its means.

In driving a crosscut by means of this method, particular care must be taken that the face of the drive is properly squared up, before firing out takes place. In particular, there should be no "toe" left in bottom of face. That is, the bottom of crosscut in front of face should not have any rising ground left

from the previous cut. It seldom happens that there is under this method, but should there happen to be, the same must first be removed.

The crux of its success, however, lies in the position, depth and direction, and further manipulation of the first hole to be fired. The position should be almost as near as possible in the center of the face; depth from 4 feet 6 inches to 5 feet. The direction should be straight ahead, that is, not pointing towards the sides, either right or left, and it should be almost horizontal, giving it just such a slight downward pitch so as just to allow it to hold water while boring.

From the bar, in the same position as from where the first hole was bored, two more are now put in, near each side of the face, slightly above No. 1 hole, and pointing slightly upwards, each about 4 feet to 4 feet 6 inches in length. Above these, and pointing towards the roof, two more side holes are bored in a similar manner, and should the ground be very hard, two intermediate holes are put in. In very few cases, however, are these two extra holes required. The machine bar is now removed and placed in position near bottom, to permit of a drill being worked from it under the bar, and from this, two bottom corner holes are put in, almost horizontal, with just a slight downward tendency. This completes the boring.

The first, or center hole, on which the success of the cut out depends, is now what the miners term being "hulled."

From three to five cartridges of gelignite are placed well into the bottom of the hole, carefully pressed home, and exploded.

This has no further effect than to pulverize the rock around the bottom of the hole, which is now carefully scraped and cleaned out again. The result is a fairly large cavity or widening of the bore in bottom. From three to five pounds of explosive, according to the hardness of the rock, is now inserted and carefully pressed down so as to confine the same into the smallest possible compass in the bottom of the hole.

In order to ensure the utmost effectiveness, the hole is subsequently filled with loose tamping, and to avoid the risk of missing fire, two detonators and fuses may previously be inserted. The result of the explosion, after these details have been faithfully carried out, is a displacement of fully 4 feet in thickness of rock for over one-half of the area of face extending from about 1 foot above the hole till nearly to the bottom, which latter may now be squared up by means of the two bottom bores already put in.

Cracks extend upwards, sometimes to the top of the drive, and the ground in the upper part of the face has received such a shaking that, as a rule, only very few cartridges are necessary in order to dislodge this portion, and to square the face which has thus advanced 4 feet. For the next cut, the bar is at once rigged up again and boring proceeded with, while the broken rock is, at the same time, removed.

The O'Meara-Lynch Mill, Tonopah, Nev.

Written for the MINING AND SCIENTIFIC PRESS by
A. J. MALLON, M. E.

During their Mizpah lease Lynch & O'Meara obtained as a natural consequence a large amount of what is considered in Tonopah low-grade ore. This ore will average from assays made by the writer between \$15 and \$22 gold and silver. Shipping such ore is out of the question when one considers the cost of hauling over 60 miles of desert.

The only possible solution was the erection of a mill and subsequent concentration of the milled ore. The problem of water was a serious one in this connection, but was finally settled by the tapping of the water channel at the wells about 4 miles south of Tonopah. The ore to be treated (about 400 tons as a test) was hauled to the above mentioned place and a Kinkead mill, with a crushing capacity of about eight tons daily, was erected by H. J. Kinkead, the present superintendent. A Frue vanner (6 feet) was installed to van the pulp.

This method proved successful and a shipment of concentrates was made on the 3d inst. to Salt Lake smelters, which will net the operators a goodly sum. The water used in crushing and vanning is pumped from a 75-foot well to tanks holding 8000 gallons. It is only necessary to pump every other day, as a reservoir is built directly below the concentrator, thereby settling the tailings. The partially clear water is drained off to a second settling tank, where a 6-inch plunger pump raises the water to the original tanks. In this manner a great saving in water is made, which is necessitated owing to scarcity of water in this district.

The power used is a gasoline engine capable of developing 4½ H. P. The Kinkead mill taking 3½, the Frue vanner ½, and the pump ½ H. P. respectively. This is small power to operate when considering the crushing capacity of the Kinkead mill. The consumption of gasoline averages twelve gallons daily, making one and one-half gallons consumed per ton of ore crushed.

Three eight-hour shifts (one man) and one extra laborer complete the working force. Taking tailings averaging \$5 and ore averaging \$20, this gives an extraction of 75%, which, considering the class of ore, is a successful extraction.

The Card Concentrator.

In the line of concentrating tables one of the latest is the invention of W. L. Card and F. S. Card of Denver, Colo., which is being manufactured and sold exclusively by The Hendrie & Bolthoff Manufacturing & Supply Co. of that city.

It is of the Rittinger type, and the improvements claimed are in the character of the table's surface; the compound nature of the stroke imparted by the mechanical movement; the manner of mounting the table so as to avoid vibration; the method of feeding the pulp and dressing water upon the table; the strength and solidity of all parts entering into its construction, and the large bearings and complete lubricating devices for all movable parts, thus insuring long life and immunity from expensive repairs and vexatious delays.

A description by the inventors is as follows: We regard as the most important feature of our invention the use of channels (see Fig. 1) instead of riffles (see Fig. 2) on the surface of our tables, which have

duced as the water flows across these channels, both by reason of their pan-shaped cross-section and the fact that they run even full, thus transforming the entire area of the table into a plane surface in so far as dressing action is concerned, while at the same time the mineral is traversing the hidden underlying channels, to the head of the table, under the protection of the overlying strata of gangue. The water over the entire surface of the table is as smooth as a mirror, showing at a glance how gentle its dressing action is upon the pulp.

Furthermore, by the action of the channels, the pulp is distributed over the entire surface of the table, every square foot of which is operative, there being no idle portions (covered with nothing but water), and hence we have not only greater efficiency, but also a greater capacity (as to tonnage) than any other concentrator in use to-day; and at the same time, by the action of these channels and our method of feeding the coarser pulp to the rear of and below the finer, we save a higher percentage of fine slimed mineral than has been possible heretofore. We use

smoothly as the cross head of a steam engine, without the slightest vibration to raise the slimes and promote their loss.

Aurite, and a General Theory of Gold Ore Genesis.

Written for the MINING AND SCIENTIFIC PRESS by
JOSEPH VOYLE.

In the Aug. 16, 1902, issue of the MINING AND SCIENTIFIC PRESS I described a newly-discovered alloy of gold with some self-selected associate metals, and gold's action in expelling, or exuding, and absorbing this alloy, asking: "What is this exude?"

Since then, by further researches on larger quantities, I have obtained a series of important facts, which I believe are entirely new. These facts have led me to consider the exudation to be a reversion to an original primary form, to which I have given the name of aurite.

Aurite is an instance of natural selection in metals; metallic gold is its natural host, from which, under definite favorable conditions, it purges itself by exudation, generally leaving its host in a refined condition, and, under circumstances favorable therefor, will return to its host, without loss of or addition to total weight or change of composition.

I find that aurite contains 60% gold. In the exuded form it is a greenish gray powder or pulverulent mass. In the metallic form its small beads are brilliantly colored—purple, scarlet, green and blue; larger quantities are variable in color, generally a purplish gray; scratching shows white metal. Fusing on a bone cupel makes no change in aurite. I found that some clays have a cupelling action on nearly all of its constituents, leaving the gold in a refined condition, except some refractory metals occasionally—not always—present. On a kaolin cupel these constituents are held in the form of a glaze; changes in color—green, scarlet and brown—come at different stages in the progress of cupelling. The brightening of the head indicates the finish. This bead is generally fine gold, but sometimes it tarnishes on cooling. I have taken this tarnished gold and by repeated liquations at advancing temperatures have finally obtained a metal that I could not fuse by any heat I can produce here; and I can heat an iron wire to incandescence and dissipate it in a shower of sparks.

As aurite maintains its identity of composition at a temperature far beyond the fusing point of gold, it could be present in the molten condition coexistent with the primary rocks, cooling with them to the solid form, and, at a suitable temperature, exuding into the pulverulent form, some of it passing, with the constituents of the primary rocks, into secondary and Tertiary rocks, to be also distributed in the sands and alluvium, the most minute particles being carried by the turbid waters into the ocean, there to be dissolved by the solvent constituents of the brine, or, on meeting clear water, be precipitated into the sands along the beach.

From the primary rocks and surrounding atmosphere there would be in action every possible means of distribution—solid, liquid, mechanical and chemical disassociation and reassociation—furnishing a basis of truth for every known theory of gold ore genesis.

Aurite is composed of at least six different metallic elements. By solution in acids and precipitation, I have separated these six elements and find that they are reducible to the solid state. Four of the precipitates are pure white, resembling precipitated chalk. Two of these white precipitates are sensitive to light. One becomes a dark violet color, the other a deep purple. By heat the violet precipitate yields a bright gold bead; the purple gives a tarnished gold head, which brightens when dropped into dilute muriatic acid. The other two white precipitates are permanently white in full sunshine; both yield, by heat, gray metal—one a light gray, the other a darker gray. Fusing both together, a medium gray metal is obtained, which on furnishing polishes to a brilliant gray surface, which on exposure to the air takes on a purple tinge. A purplish brown flocculent precipitate yields a bright gold bead. The residue is gold, which, on fusing and slowly cooling, shows a brown tinge, which disappears on immersion in dilute muriatic acid, leaving the gold with a brilliant surface of natural color. On a new white bone cupel, under a hot blast, this gold gives two sublimate; one is a purplish pink, the other a yellowish brown.

To learn some of the results of mechanical disintegration of aurite, I put some of the exude in an agate mortar with water; by grinding, a turbidity was produced; the aurite gradually changed color, resembling yellow ochre. Continuing the grinding, removing the turbid and adding clear water, the residue became very heavy and bronzed in appearance; when the water remained clear, the residue was in a state of exceedingly minute division; on fusing it gave tarnished metallic gold. The precipitate from the turbid water gave a gray metal.

In this grinding my fingers were wetted with the turbid water and I found that smooth feeling given by alkali. As potash would be supplied by granite, I added caustic potash to the water and took another charge of exude. The same result was obtained in

FIG. 1.

FIG. 2.

The Card Concentrator.

an active area of 5 by 15 feet, or 75 square feet in all. These channels are twenty-five in number, extend the full length of the table, and those adjacent to the upper, or feed side, are the narrowest and shallowest, the width and depth increasing progressively from the feed to the tail side of the table. They have the same obtuse angled cross-section as the lower operative corner of a gold miner's prospecting pan, and are widest and deepest intermediate of their ends, preferably about one-third their length from the heel or feed end of the table, and both narrow and shoal from this intermediate widest and deepest point to each end of the table. Thus the channels below the feeder expand in both depth and width, so that the rear one-third of the table's surface becomes a precipitating or stratifying zone, while the forward two-thirds, traversed by the narrowing and shoaling portions of the channels, constitutes an ore dressing zone. In the former the pulp constituents are stratified according to specific gravity with the mineral (from the coarsest to the finest slimes) gathered in the lowermost corner of the pan-shaped channels; this result being greatly facilitated by the tendency of the pulp constituents to separate as they move forward in the expanding receiving ends of the channels below the feeder, as the slimes (assisted by gentle agitation) very readily sink to the bottoms of the channels through the ever enlarging interstices among the particles traversing this rearward zone of the table's surface. In the latter, or dressing zone, comprising two-thirds of the table's surface, in which the channels narrow and shoal (while retaining the familiar and unexcelled pan-shaped cross-section throughout), the superstrata of sand are gradually raised into the cross-flowing current of the dressing water, whereby the gangue is dressed off over the tail side of the table layer by layer without in any way disturbing the sub-stratum of mineral, which follows the channels up to and over the head of the table.

There are no "eddies nor counter currents" pro-

duced as the water flows across these channels, both by reason of their pan-shaped cross-section and the fact that they run even full, thus transforming the entire area of the table into a plane surface in so far as dressing action is concerned, while at the same time the mineral is traversing the hidden underlying channels, to the head of the table, under the protection of the overlying strata of gangue. The water over the entire surface of the table is as smooth as a mirror, showing at a glance how gentle its dressing action is upon the pulp.

Furthermore, by the action of the channels, the pulp is distributed over the entire surface of the table, every square foot of which is operative, there being no idle portions (covered with nothing but water), and hence we have not only greater efficiency, but also a greater capacity (as to tonnage) than any other concentrator in use to-day; and at the same time, by the action of these channels and our method of feeding the coarser pulp to the rear of and below the finer, we save a higher percentage of fine slimed mineral than has been possible heretofore. We use

The foundation, or sub-frame, is heavy and substantial, well framed and bolted together. All bearings in the movement are $1\frac{1}{8}$ inch by 6 inches, and the table is carried by six self-lubricating babbitted sliding boxes, traversing two cold-rolled steel track rods, $1\frac{1}{8}$ inch in diameter, so that it moves as

much less time. I then took about twenty grams of exuded aurite and ground it for hours on a porcelain slab, watching the changes as they came, thus obtaining a history of the incidents in the progress of one form of mechanical disintegration of aurite, obtaining evidence of cohesion of grains in masses, formation of flakes of fine gold, adhesion to agate, iron, copper and to silver.

The gold reduced to this minute state of division, when rubbed between the fingers, reminds me of graphite by its smoothness; its heavy weight causes it to find the bottom in clear water, and its minuteness enables it to enter minute cracks and to assemble in any little pit or lower level to which water may wash it, and where, by pressure and surface friction, it may be formed into coherent masses.

I have cut placer nuggets in pieces with a fine saw and have found some of them to be only an outside skin, enclosing a pulverulent mass of minute grains of gold.

Minutely divided gold is readily picked up by some kinds of clay and carried along by and deposited with it. I have found clay, deposited by streams of water coming from gold mines, highly charged with gold in minute division. I have found microscopic gold in clay slimes from a quartz mill, the clay assaying \$16 per ton in gold.

In my placer mine, during the noon hour, when the water was shut off, except a small stream, I have seen small eddies formed at the drop from box to box; these eddies of clear water sometimes gleamed bright in the sunshine, by reason of the fine gold concentrated there. Touching an eddy with my finger would cause the gleam to cease; waiting awhile, I could see the beginning and growth of a new gleam. I could never catch any of this fine gold that the clear water was carrying away.

My deductions are that, from a geological point of view, we have in aurite a universal primary origin for all gold, both as metal and mineral; a realization of the hitherto mythical mother of gold, with possibilities of modification to all known forms of metallic gold and gold ores and to many unknown forms; that, from a chemical point of view, we have a definite basic origin, as far as gold is concerned; that, from a metallurgical point of view, we have a widening of possibilities and a basis for improved methods of testing for, assaying for, and refining of gold, and also valid reason for considering every form of rock and earthy matter a possible carrier of gold in some one of the many variations of aurite.

Jacksonville, Or., May 27.

An Exhaust Fan and Blower.

In mine ventilation it is often desirable to have an exhaust fan to draw foul air from the workings. The most common practice, however, is to force fresh air from the surface into the mine by means of a rapidly revolving fan. Strangely there is much difference in opinion as to the relative merits of the two systems of ventilation, which may be considered *prima facie* evidence that both the blowing and exhaust fans are efficient. The accompanying sketch is that of a combined blower and exhaust. By use of the gates shown the fan may be made to drive a current of pure air from the surface into the mine, or draw from it the foul gas-laden air, by a different arrangement of the gates. For instance, normally the fan is a blower, indicated by B. To be utilized as such open the gates A and E, closing C and D,

Sketch of Combined Blower and Exhaust.

and the air will rush into the blower through A, and be driven out through F into the main pipe line leading into the mine. When it is desired to exhaust from the mine this may be quickly accomplished without stopping the blower or changing its direction of rotation, by closing E and A and opening C and D. The foul air is then drawn through the main line to F, and on through the gate C into the blower B, the air being driven out at D.

Many mine superintendents think better ventilation is secured by exhausting the air immediately after blasting, and later when most of the foul air has been removed, fresh air may be forced directly to the face by reversing the gates at the blower. The theory of this is that in driving fresh air through the pipe into the works a current of air sets outward through the workings to shaft or tunnel, contaminating every foot of the working on its way out with

powder gas and other impure substances. If this is drawn out through the pipe line fresh air will enter through the workings, giving a supply of fresh air throughout. With the interchangeable arrangement as shown, either method may be employed, or both successively.

Gold Ores of Ontario, Canada.*

Written by CHARLES BRENT, M. E.

The gold fields of Western Ontario are situated on what is regarded by geologists as the oldest portion of the earth's crust now exposed.

The formations are entirely Archaean and are two in number, viz., the Laurentian and the Huronian, the latter being subdivided into the Couchiching and Keewatin series. The term Laurentian is used by Canadian geologists to designate in a petrographical and structural sense the crystalline, generally acidic, granitic or gneissoid rocks underlying the Huronian.

The Huronian of Western Ontario—in its lower series the Couchiching—consists wholly of sedimentary shallow water deposits of clay and clayey sands, now almost wholly converted into gray and brownish gneisses and mica schists, but in places merely consolidated into sandstones showing little or no alteration.

The upper or Keewatin series is largely composed of eruptives and their products, with important sedimentary deposits, now occurring as conglomerates, quartzites, grits, breccias, graywacks, slates and limestones.

The lower Archaean occurs in large isolated areas, more or less surrounded by the schists of the upper Archaean, the latter forming a rough network around the Laurentian areas.

The Huronian series dip away at high angles in every direction from the central Laurentian bosses, forming synclinals between the granite areas, and now showing sections by which the geological history of the region has been worked out.

The whole mass of the western Huronian series was once floating on a viscous granite magma which, under the varying weights of the Huronian strata or from some deep-seated internal force, swelled up into the great bubble-like domes, allowing the floating strata to sink into the spaces between. As the domes pushed upward, the surface strata were stretched, fissured, sheared and contorted according to their position with regard to the rising masses which, by friction with the older strata, had their outer cooling surfaces drawn into a sort of rough parallelism with the shear planes of the outside rocks, thus forming the gneissoid margins which almost invariably surround the granitic masses. At the same time the margins of the granite masses were affected by the contact with the basic schists becoming themselves more basic and darker in color. Felsitic dikes were at the same time injected into the fissures of the Huronian formed by the stretching and fracturing of the older rocks.

It must be supposed that these granitic magmas, though possessing fluidity, were only hydrothermally fused, since all along the edges of the contact angular fragments and slabs of basic Huronian rock,

formations lying on their sides, it may be inferred that these Archaean mountains were comparable in height to the greatest elevations of the present day. Lawson estimates the thickness of the Huronian rocks at 50,000 feet, and it is thus probable that the summit of these oldest of earth's mountains rose many miles above the present level.

Dynamic disturbances of post-Archaean times have apparently been rare in this district and are confined to the injection of a few diorite dikes and the fissuring and faulting of the rocks in the immediate vicinity of these. It must not be assumed from this statement that there has been no movement in the rocks during post-Archaean times. The clastic character of the quartz in most of the ore deposits, and the shattered pyrites, often of different ages, constantly occurring in the veins, show that movements have taken place which, however, are probably rather of secular than of dynamic character.

By the process of denudation which culminated during the glacial epoch, these great elevations have been reduced to an approximately level plane lying about 1200 feet above sea level, which presents at the present day a most interesting section through the base of this group of ancient mountains. This plane is diversified by numerous basins scooped out of the softer rocks, which are now occupied by the complicated lake system of the district.

It may be noticed that the chains of lakes conform generally to the strike of the Huronian rocks, which is approximately that of the direction of the glacial flow.

Post-glacial changes have been very slight over the entire region, as is evidenced everywhere by the freshness of the glacial strata and by the existence all over the district of brightly polished surfaces of rock which are just as smooth to-day as they were when the retreating ice sheet left them bare to the sky. This brief review of the geological history of the district will serve to make plain many peculiarities of the ore deposits and ores of this oldest of all the gold fields.

The disturbances of the Archaean period alone are responsible for the general geological arrangements we find at the present day, and also for the folding, shearing and formation of the fissures, which, by subsequent circulation of hot and cold waters, have been filled with quartz and other minerals which form the ore deposits of western Ontario.

The leveling of the Archaean mountains which took place through the long ages preceding the glacial epoch was completed during that period and the whole mass of decomposed material swept away to the south and west, to be distributed over half a continent, leaving only the solid, unaltered bases of the mountain group.

1. General leveling has left no great elevations. There is, consequently, no post-glacial drift and the ore deposits are in plain sight. What is practically a deep-level section of the ore body is laid bare with all its characteristics, and since it is axiomatic in mining that, "as the length is, so is the depth," the underground behavior of these ore bodies can be predicted with almost absolute certainty.

2. The contacts between the granites and traps, as the Laurentian and Huronian formations are commonly called, are always in plain sight, and since it has been established by actual work that these contacts are in some way connected with the presence of gold in the ore bodies in the vicinity, a useful guide is always at hand in exploring new areas.

3. There is practically no surface decomposition or surface enrichment to be met with in the entire district. A few feet of sinking, as a rule, reveals the character of the ore, and the character is maintained in depth.

4. There is no "water level" such as is commonly met with in other mining districts below which decomposition ceases and the ore changes in character. If an ore is found to be "free milling" on the surface it will retain that character to an indefinite depth.

5. The solidity of the rock in this district is such that very little timber is required, and, although shafts are commonly sunk for hundreds of feet within a few feet of the shores of great bodies of surface water, no trouble has been encountered from an excess of underground water.

6. The rocks of this district are the hardest known to the mining world, and more steel is used both in mining and crushing than in any other part of the world.

7. The absence of any considerable elevations and the consequent lack of rapid streams, coupled with the facts that there is no loose material except glacial drift, would seem to preclude the probability of any areas of placer ground being found unless the streams which must have flowed to the south from the retreating southern edge of the ice sheet during the close of the glacial period have concentrated the gold contents of some of the terminal moraines.

As has been mentioned above, the most promising auriferous deposits occur on or near the contact of the Laurentian and Huronian formations, but gold has been found as well in veins in granite areas far removed from any contact, and benches and segregations of gold-bearing quartz are found everywhere in the Huronian schists with no apparent connection with any later eruptive.

(TO BE CONTINUED.)

*Trans. Canadian Min. Inst.

The Diesel Engine.

There are four recognized means of generating power for industrial purposes. These are steam engines, water wheels, electrical generators and motors, and gas engines. Each of these has numerous types, all have their staunch adherents, and all are successfully employed for the purposes indicated—

directly into the cylinder. There is no boiler or any other of the appliances necessary to a steam plant, but there is required a small air pump and its appurtenances. No unusual skill is necessary to operate and care for these engines. Any mechanic of ordinary intelligence can in a short time become fully competent. The usual care may be entrusted to a low-priced attendant, provided a skilled man is avail-

count of the cost, would only be used in an emergency. The oil is forced into the engine cylinder by a small pump, which is under control of the governor, the regulation being effected by varying the amount of oil supplied by the pump. This method of regulation is more effective than that used on steam engines, therefore the Diesel engine readily meets all requirements in this line.

The fuel-cost saving of Diesel engines over steam engines will, of course, depend upon the relative cost of oil and coal in a given locality, and also upon the type and size of steam engine.

The essential principle upon which the Diesel engine operates is that it is impossible to compress air without increasing the temperature of the air under compression; and that if oil is introduced into air at a certain temperature or above it, it must ignite and consequently burn. The degree of compression used in the Diesel process heats the air to about 800° Fahrenheit, a temperature at which crude oil burns completely without residue in the presence of a sufficient amount of air. The Diesel engine does not operate by an explosion, as is the case with the ordinary gas or internal combustion engine of other types. There is no mixture of combustible elements in the cylinder excepting at the moment when the combustion is intended to begin. There is no explosion and there are no ignition devices of any description, the machine being a simple caloric or heat engine, using air as a medium of expansion instead of steam. Steam has received heat from the fuel at the boiler. Air in the Diesel process receives heat direct from the combustion of oil fuel mixed with the air in the working cylinder.

The engine operates on the Otto cycle or four-stroke principle, the first stroke filling the cylinder full of air at atmospheric density. The second stroke compresses the air to about 35 atmospheres. At the point of highest compression, the air is practically in an incandescent condition. Just at the reversing point in the stroke of the piston, a certain quantity of oil is sprayed through an atomizer in the shape of mist, but not vapor. This oil is immediately ignited and burns slowly through a limited portion of the stroke. The expansion of the air and gases completes the third or working stroke, and the fourth stroke ejects the gaseous products of combustion, clearing the cylinder for a repetition of the cycle.

Harron, Rickard & McCone, of San Francisco, Cal., are Pacific coast agents, where the Diesel engine may be seen, and full particulars obtained.

Electric Furnaces for Very High Temperatures.

There are few inventions in the electrical field which have benefited the chemist and metallurgist more than that comprised under the general title of

"electric furnace," says J. Wright in Cassier's Magazine for June. Up to, comparatively speaking, a few years ago, the highest attainable temperature by any known artificial means was 1800° Centigrade, or, possibly, with exceptional facilities and the exercise of great care, as high a temperature as 2000° Centigrade may, in some cases, have been attained, though the exact limit is questionable. Certainly it does not rise much above the latter figure. Thanks, however, to the indefatigable researches of Moissan, Siemens, Borchers, Cowles and some other investigators, we now possess a means for the artificial production of temperatures far above this limit, which enable us to fuse and otherwise treat commercially such hitherto refractory substances as chromium, platinum, carbon and even the once indestructible crystalline form of that element—the diamond.

Generally speaking, electric furnaces may be divided under two main headings—namely, those in which the heating effect is produced by the electric arc established between two carbon or other electrodes connected with the source of current, commonly known as arc furnaces, and those in which the heating effect is produced by the passage of the current through a resistance, which either forms part and parcel of the furnace proper or is constituted, by a suitable conducting

train, of the material to be treated in the furnace. The principle of this latter type is analogous to that involved in the heating to incandescence of the ordinary electric lamp filament, and such furnaces are, as a class, known as resistance furnaces.

The experience of late years in the construction and use of electric furnaces trends towards the establishment of the resistance furnace as a type more readily capable of efficient regulation.

A Triple Diesel Unit.

Two Single Diesel Units.

creating power for industrial uses. The low efficiency of steam engines has led to experimentation and the construction of gas engines. These are as numerous in design as any of the other various types of engines. One of the latter that is at present attracting considerable attention is the Diesel engine, manufactured by the Diesel Engine Co., 11 Broadway, New York City.

The Diesel engine is a self-contained apparatus, operating by the combustion of liquid fuel pumped

able for occasional inspection and care in an emergency. There is nothing like the responsibility involved in the use of a steam boiler.

The fuel used may be crude petroleum, "fuel oil" or kerosene, the efficiency being substantially the same with either. The crude oil, on account of its low cost, will be used in districts where it can be readily obtained. Doubtless the supply will become generally available as the demand increases. Fuel oil can be obtained everywhere. Kerosene, on ac-

Mining and Metallurgical Patents.

PATENTS ISSUED JUNE 2, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

METHOD OF MAKING SULPHURIC ACID.—No. 729,643; M. Neumann, Hamborn, Germany.

Method of making sulphuric acid, consisting conducting acid-producing gases through plurality of Glover towers, and through alternate heating and cooling zones intermediate of towers, temperature successive heating zones being higher, poorer the gases are in sulphurous acid and richer they are in oxygen.

PROCESE OF REDUCING AND SEPARATING SILVER.—No. 729,760; G. V. Guzman, Sucre, Bolivia.

Process extracting and separating silver from ores, subjecting ores to action of preprovided solution containing predetermined quantities more than one of chlorides of copper, passing resulting solution through reducing agent, and removing and collecting metallic silver from reducing agent.

APPARATUS FOR USE IN EXTRACTING METALS FROM ORES.—No. 729,819; J. F. Webb, Denver, Colo.

Apparatus for extracting metals by chemical process, comprising tank provided with filter bottom and perforated pipe placed within tank above and near

filter bottom and connected with air supply device, perforations being arranged to discharge streams of air upon bottom.

UNDERREAMER FOR DRILLING OIL WELLS.—No. 729,743; M. H. Dunn, Fullerton, Cal.

In underreamer, combination with body, of bits pivoted thereto, means spreading bits from body, and guide ribs located on outside of bits and extending longitudinally thereof and tapered or beveled both ends, whereby entry of underreamer into tube facilitated and tilting of reamer prevented during transit in tube.

ATTACHMENT FOR WINDING SHAFTS FOR DUMPING DOORS FOR CARS.—No. 729,746; A. Filer, Altoona, Pa.

Combination with winding shaft and ratchet wheel fixed on shaft and having squared hub piece, of pawl to hold ratchet wheel against return movement, stem of pawl being pivotally supported and standing approximately vertical and adapted to engage ratchet wheel by gravity, and pivotally mounted flat-curved pawl arm provided with plurality teeth to engage ratchet wheel and weighted at lower end beyond pivotal support, and locking means to lock pawl arm in engagement with ratchet wheel.

UNLOADING MEANS FOR AIR COMPRESSORS.—No. 730,121; E. Hill, Norwalk, Conn.

In multiple stage compressor combination with cylinders operating at different pressures, escape valve controlling outlet from duct between cylinders, communication between system beyond high pressure cylinder and escape valve, whereby escape valve is moved to open outlet from interduct when pressure system beyond high pressure cylinder exceeds predetermined maximum, and valve controlling opening into high pressure cylinder and adapted to be rendered inoperative by the drop of pressure resulting from opening of escape valve.

AGITATION TANK.—No. 729,806; J. Stoveken, Cripple Creek, and L. Stoveken, Florence, Colo.

Combination of tank having outlet adjacent to top, wings connected to and extending inwardly from vertical wall of tank, conduit leading from point adjacent to bottom of tank, having lateral opening adjacent to lower end, central vertical cylinder arranged in tank, piston movable in cylinder, and having rod extending through upper head thereof, gear disposed above tank, adapted be connected by

driving connection with motor, shaft stepped on piston rod, and keyed to and adapted move vertically through gear, agitating means carried by shaft, and comprising blades disposed below wings, and curved in direction of length and inclined in direction of width, connections between outer portions of blades and head on shaft, connections between inner portions of blades and shaft, and pipe communicating with cylinder below piston, adapted be connected with source of fluid pressure supply.

FILTER PRESS.—No. 729,807; J. Stoveken, Cripple Creek, and L. Stoveken, Florence, Colo.

In filter press, combination of bag having inlet for material pressed, also discharge gate, means for pressing bag and for holding gate closed while bag is being pressed.

METALLURGICAL FILTER.—No. 730,195; J. Stoveken, Cripple Creek, and L. Stoveken, Florence, Colo.

A filter comprising frame having parallel ways at upper side, belts having upper stretches disposed in ways, means for driving belts, endless filter cloth interposed between and connected with belts, rolls mounted in frame and disposed below upper stretches of belts and filter cloth, idlers for holding upper stretches of belts down in engagement with rolls, rolls arranged above and adjacent to upper stretch of filter cloth, upper roll, belt passed around rolls above and adjacent to filter cloth and upper roll, means for supplying water to belt.

LAMP HOLDER FOR MINERS' CAPS.—No. 730,076; C. R. Anderson, Allegheny, Pa.

Lamp holder comprising angular support having top aperture rearward from angle thereof, top portion forward from aperture adapted to be embraced by and sustain lamp hook which depends through aperture, guide beneath top portion having backwardly and forwardly extending slot to receive depending end of hook.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

A. Raymer and E. Hardy of Los Angeles, Cal., have begun operations on the Windham Bay Chief mine at Windham Bay. They have shipped an ore crusher, water wheel, steel hydraulic pipe and other machinery, and will have the mill in operation this season. There are six companies operating at Windham Bay this season. The California-Alaska G. M. Co., of Los Angeles, Cal., is putting in machinery and will build a 5-stamp mill this season. The company owns claims on the same ledge on which the Yellow Jacket M. Co. is putting up three mills of four 1000-pound stamps each, with seventy-five tons capacity per day. Large bodies of low grade are being found. The mines are said to require little timbering and water power is available to drive machinery.

The Alaska-Juneau mine, on Silver Bow Basin, near Juneau, has resumed machine working in the tunnel. There are fifty men at work.

S. I. Silverman, manager of the Brown Alaska Co., near Lyman Anchorage, Prince of Wales Island, says he has men at work clearing the site for a smelter of 400 tons daily capacity.

ARIZONA.

COCHISE COUNTY.

A body of sulphide ore is reported struck in the tunnel being run by the Chiricahua Dev. Co. in the Chiricahua mountains, near Douglas, showing 3 feet of 6% copper ore. The company is composed of Michigan copper men, Kingman Bros. of Marquette being the principal holders. The company had a diamond drill at work prospecting the ground for some time before they started their tunnel. Another shift has been put on and will start other workings 300 feet below the present tunnel site.

GILA COUNTY.

There are thirty men at work at the Mallory mine, near Globe, and drifting is being continued both ways at bottom of the 460-foot shaft, one drift west and the other northeast. The former is in 100 feet and shows copper sulphides. They expect to strike the main ore body by July 10, says the Globe Times.

J. Glasson and J. B. Whelan have contracted to deliver to the Black Warrior C. Co. smelter seven tons of iron ore per day from the Glasson mine, 9 miles north of Globe and 2 miles east of the Nugget mill. The Nugget road has been repaired for a length of 4 miles. The Glasson claim is said to show a ledge between lime and diorite, with 10 feet of magnetic iron ore, going 50% iron in excess of silica, and carrying 5% copper, making a desirable flux for smelting the siliceous ores of the district.

Superintendent H. Zschoechner says he has begun development work on the Gladys mine at Dripping Springs, near Globe. This is one of the gold claims on which he has a bond for W. B. Devereux of Colorado Springs, Colo. Two shafts will be sunk to depth of 100 feet and the lead prospected. The first payment of \$5000 on the bond on the Gladys and Cowboy claims was made last week.

GRAHAM COUNTY.

The Shannon C. Co. at Clifton is producing twenty-three tons of copper daily. The smelter consists of two 225-ton furnaces and they have a concentrating plant. The product of the Shannon Co. is a matte which is put through the converter plant of the Arizona C. Co.

The Copper Era reports a consolidation of the holdings of the Clifton Con. C. Co. and the New England C. Co., owning adjoining groups west of the Frisco river, near Clifton. The holdings of the two companies, together with the claims of the Markeen Co., which failed to do its assessment work last year, will total 100 claims, says Manager Dunham of the Clifton Con. Co. A. P. Ayling is manager of the New England Co., which has developed its ore body to a depth of 600 feet.

MOHAVE COUNTY.

(Special Correspondence).—Another 100-foot contract for drifting on the 500 level of the Tennessee mine has been let. The silver discovery made by J. Carroll, near the Juno and Mormon Girl mines, is being developed. Assays show 200 ounces silver. The shoot on the Emerson mine, being worked by S. Smith, in which the ore was struck at a depth of 70 feet, is down 115 feet and shows the shoot an average of 14 inches, with a value of 2½ ounces gold per ton. The owner will put in a gasoline engine and hoist, and sink to

200 feet. The Redemption mine, owned by R. J. Ferguson & Sons, is in shipping ore in a winze that is being sunk in the lower tunnel. Water is coming in and arrangements are being made to put in a pump. Assays of the ores give 12% copper, 45 ounces silver, \$10 gold and some lead. Shipments of this ore are being made ready to send out. The North Star mine reports developing a body of 20 inches of ore, assaying 100 ounces silver and 2 ounces gold. The shaft is down 75 feet. This is on the mountain at the head of Alum wash. The Queen Bee mine at Mineral Park is in silver ore of shipping grade. Since putting up the steam hoist development work has increased. Chloride, June 8.

PIMA COUNTY.

The Del Monte group of copper mines, 35 miles east of Tucson, has been sold to Cananea men for \$250,000, says the Tucson Post, and D. Donovan, former part owner, is retained as superintendent. There are 25,000 tons of ore on the dump ready for the smelter which will be built by the new company. Operations have begun. Connection will be made with the Phoenix & Eastern railroad which is building and will run within 10 miles of the mine.

Twelve men are at work on the mines of the Blue Grass G. & C. M. Co. in the Rincon district, near Tucson, sinking a double-compartment shaft.

PINAL COUNTY.

Oil is reported coming into the well being drilled in the Hackberry wash, near Kelvin, by the Pinal Paraffine Oil Co. Another cable has been put in place and the company are going down to the 2000-foot mark. They are down 1260 feet, says Superintendent Parker.

YAVAPAI COUNTY.

The tunnel on the Crook mine, near Prescott, is in 1000 feet and showing a pay streak of 18 inches of ore, which is said to carry \$42 per ton in gold. The air is getting bad in the tunnel and work is temporarily suspended for that reason. Blowers will be used. This property is being developed by the Pan-American M. Co.

The Bannie G. M. & M Co., near Walker, is taking ore from a 400-foot drift from the 100-foot level. The ore values run \$20 per ton and the ore is a sulphide. The company intends to build a mill to treat the ore on the ground.

The Sparneck custom stamp mill at Kirkland is running steadily. The power used is obtained from Kirkland creek. The stamp mill on the Contention group of mines in the Bradshaw mountains, near Del Pasco, southeast of Prescott, is completed. Ore is being mined in the 665-foot tunnel.

CALIFORNIA.

AMADOR COUNTY.

At the Telegraph Hill mine, operating on Rancheria creek, near Amador City, they have changed their system of work and are sinking a shaft on Mickey Frea gulch, where they expect to tap the gravel channel. The work is being done under the supervision of L. F. Eaton.

BUTTE COUNTY.

Operations at the mines of the Big Butte M. Co. on west branch of Butte creek, 2 miles from Berdan, are progressing. After two years of development work they are piping with one giant, with satisfactory returns. They have 6½ miles of ditch and flume and a 300-foot dam. They propose to enlarge the plant.

CALAVERAS COUNTY.

The work of unwatering the Esperanza mine, near Mokelumne Hill, is progressing and has reached the 900-foot level.

The Lee Hunt mine, near Milton, has been bonded to San Francisco parties, says the Calaveras Prospect, and machinery is being put in. The mine is on the Hunt ranch.—The Morning Star mine in Salt Spring valley, near Milton, is to be developed by G. Tolman.

Superintendent Robinson says machinery will be put in at the Stockton Hill mine, near Mokelumne Hill, and operations will resume.

The shaft of the Madison mine at Angels is being unwatered and connection will be made with the Gold Cliff mine.

Manager Gray of the Shepard gravel mine, near Sheep Ranch, says they are putting in a 6-stamp triplicate discharge mill.

A number of transfers of mining property adjoining the Gwin mine have been made to the Rialto M. Co., including the Good Hope, the North Paloma Extension and Victor mine and millsite. A. Caminetti of Jackson is manager. It is reported that operations will begin this month.

EL DORADO COUNTY.

Superintendent Gould has men at work

at the Excelsior mine on Pacific bill, near Placerville. The tunnel is being cleared out and a blacksmith shop has been built.

A. Harpending is pushing work on his mine on Mathenas creek and is putting up machinery consisting of a hoist, 5-stamp mill and pumps. A shaft will be sunk on the Mathenas creek mine.

The Rosenfelds of San Francisco, owners of the Vandalia mine, are preparing to open a limestone deposit near Bennet station. A kiln will be erected and the product used at the Vandalia mine.

INYO COUNTY.

Near Coso Hot Springs, south of Darwin, a find of a ledge of gold-bearing quartz is reported, which is said to run \$25 per ton. It is stated that water must be pumped from Little Lake, 12 miles distant, in order to work the claim.

KERN COUNTY.

The Monarch Oil Co. is building a 75,000-barrel reservoir in Sunset, which it is proposed to cover.—Last week well No. 4 of the Revenue Oil Co., near Bakersfield, which has been pumped for three years, began flowing at rate of 500 barrels a day and is continuing it.

The business portion of the mining town of Randsburg was destroyed by fire on the 6th inst.

MARIPOSA COUNTY.

The Hayseed mine, near Whitlock, has resumed after being closed down on account of scarcity of fuel. The Farmer's Hope has men at work, under E. B. Walters as superintendent.—C. Czerny has bought the S. John's interests in the Bull Dog mine and expects to work it this summer. A mill test gave returns of \$7 gold per ton.—Hart & Co. have opened a pocket on the Jones mine, giving returns of \$5 to the pan.

MENDOCINO COUNTY.

The Russian River Oil and D. Co. have made a contract by which a well will be sunk to a depth of 1500 feet near Ukiah.

NEVADA COUNTY.

The I. N. Robinson mining and timber properties, 4 miles from Graniteville, have been bonded to L. S. Johnson of Alleghany for an Eastern company. The property consists of the Jim mine, three gravel claims of twenty acres each, and 100 acres of timber land, also water rights on Little Canyon creek. The Jim mine is near the Baltic and is on the ledge that runs across to Diamond creek. The mine will be reopened and a new tunnel run to open the vein. It will be 1400 feet long.

Operations have begun at the Kenton mine on Kanaka creek, near Alleghany, under Superintendent A. Fitzgerald.

Superintendent Kartschoke says he has begun work on a shaft at the end of the south drift of the Delhi mine, near Grass Valley.

The mill of the Gray Eagle mine, near Mayburt, is crushing ore.

The Seven-Thirty mine at Deadman's Flat, near Grass Valley, has been bonded to F. Enzensperger, superintendent of the Red Cross mine, near Washington, and work of reopening the group begun. He intends to put in additional machinery that will be capable of developing the property with depth. Oil may be used as fuel instead of wood.

Negotiations are reported in progress for opening up and working the Cold Spring Blue Gravel mine on Harmony ridge, 2½ miles northeast of Nevada City. The property consists of 410 acres of patented ground, covering the entire gravel channel from rim to rim for a mile. All the ground west of Cold Spring has been worked out.

Operations have resumed this week at the Sunflower mine on Squirrel creek, in Deadman's Flat district near Grass Valley, and the pumps started. Sinking will begin as soon as the mine is drained. Drifts will also be run from each side of the shaft, says Superintendent Ballou.

PLACER COUNTY.

The Chicago mine at Penryn is reported being reopened, with F. Hartley as superintendent. Hoisting machinery and pumps are being put in.

SAN DIEGO COUNTY.

Superintendent R. K. Humphrey of the California Gold King mines at Picacho says 250 men are on the payroll of the company and fifty additional miners will be put to work this month. About half these men are on development work preparatory to an increased output of ore. The leaching plant is being run to full capacity and 350 tons of ore is the daily output of the mine.

SAN MATEO COUNTY.

The Purissima Oil Co. of San Francisco has leased the ranch of T. Johnson, near San Mateo, and will begin sinking wells.

SHASTA COUNTY.

The big dredging plant of the California

& Detroit Dredging Co. (the Heintz dredger) on Clear creek below Horseshoe, near Redding, was totally destroyed by fire on the 3d inst.—loss, \$80,000, reports Manager Heintz. J. R. Hayes of Detroit, Mich., is president of the company.

SIERRA COUNTY.

Superintendent D. R. Smith has begun preparations to reopen the Primrose mine in Hog canyon, near Downville. G. G. Morrison, of Sierra City, is foreman and has men at work.

TUOLUMNE COUNTY.

The new three-compartment shaft being sunk on the Santa Ysabel mine near Stent has reached a depth of 200 feet.

The Boston placer claim, a producer in early days, is being worked by Morris Bros. at Jeffersonville, near Columbia.

The incline shaft on the Dutch mine at Quartz is down 1400 feet. Stopping is in progress on the eighth level.

The Buckeye placer mine, near Jeffersonville, near Columbia, is being reopened under lease. The tunnel, which runs into Table Mountain 1300 feet, is being cleaned out and timbered in places.

The Mazeppa shaft, near Stent, is being repaired and the water pumped out after the temporary shut down.

A 2-stamp mill is crushing rock from the pocket mine dumps of the Smith mine on the Fleming vein, near Jamestown.

Superintendent A. Scott of the Providence mine, on the North Fork of Tuolumne river, near Carters, says he will use a diamond drill to explore their ground. The machine will be electrically driven and have a 300-foot capacity.

A. P. Johnson has bought a one-half interest in the Edna J. mine, located 3 miles east of Sugar Pine.—The owners of the Prudhomme mine, near Carters, have decided to sink a shaft 300 feet. The buckets will be replaced by skips and machine drills used.

A 100 H. P. compressor, a boiler and a 225 H. P. engine have increased the hoisting facilities at the Jumper mine at Stent. Improvements to the mill include two table concentrators, four belt machines and a sand plant. There are 140 men at work.

H. M. Heath of Boston, Mass., manager of the Horse Shoe Bend M. Co.'s mines near Columbia, says they are making preparations to put in machinery. The holdings of the company are on the Tuolumne side of the Stanislaus river, 1½ mile above the Melones and below the Densmore and Riverside mines. He says they own a right to 10,000 inches of the waters of the Stanislaus, and it is intended to begin as soon as the water of the river will permit the erection of a dam at a point already chosen. A ditch is being located and the line cleared. A site for an electric plant and a mill has been selected, and a plant capable of developing 1200 H. P. will be installed. The water rights of Quail gulch and Devil's canyon have also been secured. The company intends erecting a mill capable of treating 500 tons of ore per day, which will use 300 H. P., and the balance will be devoted to mine operation and lighting purposes. E. Goss is superintendent.

J. O. Bouvon has bonded the Black Diamond quartz mine, near the Rawhide mine, near Jamestown.

Work in the shaft of the Sierra mine, near Groveland, is progressing, with three shifts at work, and the 200-foot level is expected to be reached this month. At that point a station will be cut and drifts run on the vein east and west, says President Giles. A mill will be built.

COLORADO.

BOULDER COUNTY.

The Fourth of July tunnel on Arapahoe peak is in 990 feet, and has 800 feet more to go before reaching the copper-bearing dyke which the Con. C. M. & S. Co. owns. Ore has been taken from the Fourth of July shaft, running 10% copper, \$15 gold and 30 ounces silver per ton.—The United States Gold Corporation has 4500 feet on the extension of the Fourth of July and is driving a 5x7 tunnel into Arapahoe which will cut the veins at 200 to 1200 feet depth. They are putting in a compressor plant to be run by water power. The tunnel will be 2000 feet in length.—The Denver Tunnel Co. is working on its Alpha tunnel in Mineral mountain.—Manager Hughes has resumed work on the Rosalind tunnel into Hematite mountain and is making good progress. Indiana and Denver people are interested.—Another shipper has been opened through the Mogul tunnel in Spencer mountain.—Phillips & Shahan, owning the Little Stranger, made a shipment of smelting ore last week.—Lessees Miller & Martin, on the Gold Coin, operating through the Mogul, are breaking ore and have begun shipping. They are operating on a bond and lease.—Operations by the Copper King Free Gold M. Co., at its mines at Dawson City, near Eldora, have been re-

assumed. Their principal values are in copper.

CLEAR CREEK COUNTY.

Nearly all the mines at Idaho Springs have resumed operations, the managers announcing that they would start work on their properties on a basis of eight hours per day, with a minimum wage scale of \$2.75 per day, and make no distinction between union and non-union men.

The work of placing the pipe for supplying water power at the Terrible mine, near Silver Plume, is about completed and the machinery will be set up. The dam that has been built will enable the storage of a large amount of water, so that the machinery can be operated by water power a large portion of the year.

The Commodore M. Co., in which E. E. Reynolds and D. H. Moffat of Denver are interested, is driving its tunnel into Red Elephant mountain at Lawson with two air drills. The tunnel has been driven 420 feet in less than two months and is making 6 feet per day. The distance to the principal lodes of the group is 2000 feet.

A contract has been let by the Indiana G. & S. M. Co. to drive 200 feet of an adit tunnel on their mine at Silver Plume. The tunnel will be driven in on the Indiana vein and it is intended to drive it a total of 500 feet, and also drive crosscuts from the Indiana to other lodes of the group.

The air compressor the Hazelton M. Co. will set up at the Baltimore tunnel, near Silver Plume, is on the ground, says Manager Rogers. The engine chamber, 150 feet from the mouth of the tunnel, has been cleaned out, as it was caved in, but the hoisting engine was found to be damaged. The tunnel is in 700 feet, but the 130 feet having been driven by hand. It is estimated that it will require 1000 feet more of driving to reach the Shively vein, which will be cut 400 feet deeper than the lower workings of that mine which had to be abandoned several years ago on account of the water struck.

Work has been resumed on the Nickel Plate tunnel, near Argentine. It is reported Weaver & Co. have opened up a body of ore in their lease on the Equator mine.

Manager J. R. Elgan has closed a contract for opening up the Lone Tree claims at Freeland and will drive the adit ahead on the Great Western vein to the line of Lone Tree, both being on the same lode. The company will drive the Great Western for 600 feet and then come into the Lone Tree, and will follow it for 2000 feet, opening the known ore bodies at depth of 600 feet below the present workings. The Great Western is owned by the New Era Co., which has granted a right of way through the New Era workings. Machine drills have been at work in the New Era adit for 800 feet and a crosscut of 45 feet has been made to the Great Western vein, which proves to carry 14 inches of smelting ore and 3 feet of concentrating ore, all of which will be treated at the New Era mill. The Teller vein also crosses the Lone Tree, and Manager J. Owen has closed a contract to work the Teller through the Lone Tree workings when that territory is reached. The new workings will develop the Teller 600 feet deeper than the present bottom of the shaft. In the meantime sinking of the Teller will be continued.

CUSTER COUNTY.

Teams are at work hauling machinery and supplies from Rockdale for the Keystone M. Co. at Custer. The Keystone people are operating on Ten-mile hill. There has been more machinery shipped into Custer county during the last six months than the entire year previous, says the Times.

G. W. Avery has a bond and lease on the Dirigo mine at Querida, adjoining the Aburdiz group, and has begun operations.

President S. H. Baker of the Ilse G. M. Co., whose mill buildings and shafthouse were burned to the ground at Ilse, 25 miles southwest of Florence, is drawing up plans for rebuilding. The loss caused by fire is estimated at \$75,000, partially covered by insurance.

To test their own ore and to save the expense of long hauls to smelting points, Lessee Murphy on the Vanderbilt mine, near Rockvale (Fremont county), decided to put up milling apparatus. He will also build a shafthouse and sink a shaft that will admit of hoisting a heavy tonnage. Machinery for the hoist is on the ground.

FREMONT COUNTY.

The Blaney Oil Co. of Florence has been incorporated under Arizona laws. Eighty acres of oil ground is owned by the company near Florence and five wells are to be drilled. L. & E. L. Blaney and C. W. Blaney are officers.—The oil well opened by the Lobocho Oil & Refining Co. on the Lobocho orchard, near Florence, is being drilled deeper.

GILPIN COUNTY.

The Waltham mine has been sold to an English Co., J. H. Gower, of London, England, formerly of Denver, manager, for \$110,000 cash. The property will be operated by the Waltham Mines Co., Ltd., and extensive development work will be done. The Waltham mine has been worked for several years past by lessees, the greatest depth attained being 200 feet. It is near the Saratoga mine, near Russell Gulch. The same company owns the Gower mine in Central City and the Pierce mine near Black Hawk.

LAKE COUNTY.

Colorado Springs men have organized for the development and operation of Lake county placer fields on the Arkansas river, G. T. Warner, M. S. Atkinson and H. R. Penderly incorporating the Arkansas River Placer M. & I. Co.

J. J. Brown, of the Ibox Co., and A. Nichols of Leadville have a lease on 100 acres of mining ground in Big Evans gulch, near Leadville, and have started development work. The group is north of Breese hill.

LAS ANIMAS COUNTY.

Trinidad reports say the production of coal by the Colorado Fuel & Iron Co. for May was 210,327 tons—an increase of 2500 tons over the greatest previous monthly production. The coke output for the same time was 74,033 tons. Total production of all coal mines in the county for May was 366,327 tons, from which it is estimated the total output for 1903 will be over 4,250,000 tons of coal.

MINERAL COUNTY.

Operations were resumed on the Equity M. & I. Co. group, near Amethyst, last week and men put to work driving the crosscut tunnel to cut the veins crossing the claims that are opened up by surface workings farther up the mountain.

SAGUACHE COUNTY.

The Colorado M. Con. Co., operating near Cochotopa, report opening up a vein of ore in the new shaft, 4 feet across and carrying good values in gold. The company last season built a 10 stamp mill, but did not have sufficient ore opened to keep it busy. The company has done considerable development work on the Standard and Sterling lodes on the Cochotopa.—The Rough Rider G. M. Co. has a bond and lease on the Boston lode in Cochotopa district and will begin operations this month. The workings show a vein that carries \$4 per ton in gold.

SUMMIT COUNTY.

It is reported the Bonanza mine, near Kokomo, owned by T. Connors, will resume. The English tunnel, on Fletcher mountain, is also to resume.—The Union Con. group, Gold Hill, will begin operations this month, and continue driving the tunnel. The tunnel is driven half the intended distance. The upper workings show ore running in gold and lead. Buildings have been erected at the mouth of the tunnel for electric power and drills.—The Nettie B. is again in operation. The workings show bodies of lead, iron and zinc sulphide.

The Belle mine, near Montezuma, the last few months has been shipping high-grade silver ore. The Bullion mine of the Pride M. Co. is producing similar ore. The Ohio M. & M. Co., in driving the Ohio tunnel under the Pennsylvania workings, on the same vein, have opened up and are showing in the breast of the tunnel 8 feet of smelting and mill ore. This gives this company 400 feet of proven stoping ground for 1000 feet, says Superintendent R. T. Williams, and machine drills will be put in and the ground opened up. The mill is being overhauled and more concentrating tables added. The ore is lead, silver, gray copper and chalcopryite, quite free from zinc. The Rothschild T. & M. Co., near the western portal of the Atlantic & Pacific (Brick Pomeroy) tunnel, is steadily driving with machines a crosscut to the Rothschild vein. The tunnel is in 2300 feet, and has a vertical depth of 1300 feet.

TELLER COUNTY.

L. L. Aitken of Colorado Springs, of the Moon-Anchor Con. G. M. Co. at Cripple Creek, says the company has decided to sink its three-compartment shaft an additional 250 feet, making a total depth of 1062 feet. The work will be under way by the time the drainage tunnel is completed and will be carried ahead so that by the time the mine is drained the shaft will have been finished to the 1000-foot point, when an exploratory level will be driven out and a search made for the Moon-Anchor ore shoot. The Moon-Anchor lost its main ore shoot in 1898 at a point between the 400 and 500-foot levels and from the latter depth down to the lowest workings no trace of it has yet been found. A depth of 1000 feet is expected to bring the shaft into the granite. F. J. Campbell, manager of the Vindi-

cator Con. G. M. Co. at Cripple Creek, states that the pumping which has been in progress in the 1200-foot level of that mine has drained the mine to that level. The flow of water has been decreasing of late until it is now reduced from 500 to 300 gallons a minute. They are driving the twelfth level north, opening ore all the way. The winze between the tenth and twelfth levels has been finished. The shoot at the point in the tenth level where the winze was started was 38 feet wide of smelting ore. South of the shaft they are sinking a winze from the 800 to the 1000-foot level and are down 100 feet of the way. The production for May was 1200 tons of the usual grade.

The manager's report to the London office of the Stratton's Independence mine at Cripple Creek shows the returns from the mine for the nine months ending March 31, 1903, to be as follows: Total output of shipping ore, 65,415 tons; total gross value, £279,632, or £4 5s 5d per ton of shipping ore; add sundry receipts from dump leases, etc., £5590; total revenue at the mine, £285,222, from which are deducted working expenses £88 25s, freight and treatment £107,659, leaving a surplus of £89,308 over working expenses, or £1 7s 3d per ton of shipping ore. From this surplus the development work and the additions to plant, machinery and buildings, amounting to £30,554 and £1029 respectively, have been provided, leaving a net balance to the credit of the revenue account of £57,725 for the nine months.

The Raaler mine, at Victor, owned by the C. K. & N. Co., as well as the Modoc mine, is to be equipped with washing machines that will cost \$5000.—Work was resumed on the El Paso mine, in Poverty gulch, last week. Pumping has been stopped for the present, as no headway could be made with the water. The water has raised 60 feet above the ninth level, but there is plenty of ore yet blocked out in the upper levels. It will be necessary to put in additional boilers before a successful attempt can be made to rescue the drowned pumps at the 900-foot level.

The Montreal M. & M. Co., operating the Fluorine claim on Copper mountain, near Cripple Creek, is shipping regularly. The value of the porphyry runs \$25 in gold per ton. The shipments are averaging seventy tons a month, and they will be increased this month.—The Globe mill, a cyanide process, has resumed operations after an extended idleness. It will treat only low-grade ores. Its capacity is 100 tons per day. B. Ross of Denver is manager.

The Abe Lincoln mine, in Poverty gulch, is yielding an average of forty tons of ore per day, that runs two ounces to the ton. The ore shoot which was opened in the fifth level south of the shaft, and in Lillie ground, continues, the ore being broken 2 feet in width.

Superintendent W. B. Bainbridge says he expects to have the Cripple Creek drainage tunnel completed between August 20 and September 1. Despite the several delays to which they were subjected during May, the tunnel was driven ahead at the uniform rate of 19 feet a day (but half a foot under schedule time), and from now on it is planned to do better than 20 feet a day.

The Telegraph says it is the intention of President Burns of the Portland M. Co., at Cripple Creek, to have in his employ by Sept. 1st at least 1000 men. The mine is outputting 300 tons of ore per day. The air compressor, capable of handling 110 machine drills, is expected to be in place by July 1st. The battery of boilers is also being increased.

H. C. Oastler, J. E. Pender and W. F. Tomlinson have bought from the Doctor Jack Pot Co. the dump at the mouth of the incline shaft on the Ingham claim, near Cripple Creek. It is intended to put up on the ground a number of tanks and the dump will then be treated by cyanide.—J. R. Barbee and A. Fiddel have a lease on a block of ground on the Maud S. on Tenderfoot hill, owned by the United Mines Co. It is intention of lessees to prospect their territory at surface to determine where to put down a shaft.

While gold values in the 1050-foot level of Stratton's Independence have deteriorated somewhat in recent explorations, south of the main shaft mineral of commercial value has been exposed in bodies of good size in same direction. On 100-foot level a drift on Bobtail has advanced to a point 110 feet south of shaft, where quality was poor, but at 36 feet south on 200-foot level of the Little London a 4-foot body is assaying \$28. Three feet of ore in the north drift of this vein returns \$30. At depth of 500 feet a new south drift in granite shows \$20 ore in a 5-foot shoot.

The Ida May Co., at Cripple Creek, has leased to J. E. Smith blocks 1 and 2, which include the main working shaft, for a period of three years. He is cross-cutting for the extension of the Joe Dandy dyke that extends through the property and into the territory of the

Brigadier claim on which he also had a bond and lease. If he succeeds in opening ore in the dyke he will sink a new shaft through which it will be worked. There are four other sets of lessees working on the ground of the Ida May Co.

IDAHO.

BLAINE COUNTY.

S. M. Smith of Salt Lake City, Utah, reports developments reviving in Greyhound district. Ore was formerly sent out to Ketchum by pack train. On the Bull Dog group of claims, owned by I. Daly and C. Crane, they are driving a crosscut tunnel to cut their main ledge at depth. The vein is 10 feet wide and between granite walls. Openings on the ledge have been made in shallow shafts and in open cuts. Average values show \$20 to the ton, mostly silver and some gold. A showing has been made on the John Henry location, owned by J. Biggs and J. Hays of Boise. They have opened up the ledge showing high-grade ore.

Operations have been temporarily suspended on the 1100-foot level of the Tip-top mine, near Hailey, owing to the influx of water that was tapped.

BOISE COUNTY.

At the Ella Hill mine at Neal, near Boise, being worked by Godbe Bros. of Salt Lake City, Utah, an ore strike has been made. In the tunnel started to open the ledge, when it had been driven 30 feet it cut a 2-foot blind ledge 100 feet from the main ledge. Assays gave returns of \$40 in gold. A drift has been run 40 feet on the ledge and the ore is showing 5 feet wide. The tunnel continues.

J. T. Hodson, manager of the Lincoln Co.'s properties at Pearl, says quite a number of mines and mills in the State using gasoline engines have had to quit business. At the Lincoln he has made arrangements to discontinue the use of gasoline and put in electric power for both mine and mill. A dynamo is on the ground and the wires are being strung from the power plant at Payette.

IDAHO COUNTY.

In Thunder Mountain district W. A. Stevens, manager of the Mines Exploration & Dev. Co. of New York, has bonded the Crown group of six claims on Big creek, near Roosevelt, for \$25,000. The ore body on the claims is said to be 4 feet wide and gives an average assay of \$40.

H. Madgwick, of Lewiston, reports at his South Fork placer mines, in upper Clearwater section, the hydraulic plant is in operation. Madgwick et al. have 250 acres of gold-bearing high bars on the south fork of the Clearwater, 12 miles from Grangeville. This has been developed by cutting 3 miles of ditch, conveying the waters of four small streams to a reservoir, from which it has been piped on the ground.

D. Doyle of Spokane, Wash., manager, reports work progressing on the Monte Carlo group, 1½ miles west of the American Eagle mine, near Elk City. It is a gold proposition. The American Eagle mine is producing regularly.—At the Hogan mine they are putting in twenty more stamps in addition to its equipment of twenty.

Three gold bars, with an assay value of \$4500, were shipped last week—the result of cleanup of thirty days' run of the Crackerjack mill at Buffalo Hump. The Crackerjack has a 5-stamp mill. The company will put in five additional stamps, which are expected to be in place by August 1.

SHOSHONE COUNTY.

L. W. Steedman, manager of the Paragon mine at Murray, says owing to deep snow and high water, the company was delayed resuming work till this week. They are sinking the main shaft, which is down 100 feet. When the 300-foot level is reached, a crosscut will be run to the ledge, a distance of 145 feet.

D. Doyle of Spokane, Wash., manager of the Monte Carlo mines, near Elk City, reports finding a body of asbestos that could be taken out from the surface in commercial quantities, on Oro Fino creek, 16 miles above Oro Fino. The ledge was of white asbestos, 30 feet wide and showed fibers 6 inches long.

Larson & Greenough, who own the Morning mine at Hunter, near Mullan, are shipping 2800 tons of silver-lead concentrates a month, at an estimated profit of \$25,000.

KENTUCKY.

CRITTENDEN COUNTY.

Near Marion, work on the fifty-ton zinc concentrating plant of the Columbia M. Co. is progressing. The Kentucky Fluor Spar Co. separating plant is being operated to its full capacity, and its ground and fluxing products are being used in the steel and glass trades.

The Old Jim mine continues regular shipments of zinc blende and carbonate. There are 500,000 pounds of "jack"

ready for shipment, in addition to the large tonnage of carbonate. Owing to the fact that the blende is ready for shipment after being hand picked, the working costs in this property are low. Steam is to be substituted for gasoline power.

Mining operations are being carried on inside the city limits of Marlon, along what is known locally as the Marlon Break, says the Lead & Zinc News. The Lucille M. Co. are putting in an 8-inch pump on their shaft. A showing of zinc carbonate is being developed on the property of the Reed M. Co.

MISSOURI.

JASPER COUNTY.

Joplin reports say that the sales of the first five months of 1902 averaged 5258 tons per week, while the sales for the same period of 1903 have averaged only 4705. The total sales of zinc to May 30th are 12,156 tons behind the same period of 1902. The unsatisfactory weather has had much to do with the reduced shipments. Like all the Southwest, Joplin has been suffering from heavy rains. The mines around Badger, including the Peacock Valley and Mabel mines, have been overflowed by Spring river. The Badger mine, from which the camp takes its name, had been at work only a few days, lowering the water which had filled the mine during the March flood. It will take thirty days to restore these properties to shippers, says the Lead & Zinc News.

MICHIGAN.

A Calumet dispatch to the New York Commercial estimates the output of Lake Superior copper this year at 200,000,000 pounds. The output for the first four months has been 66,500,000. The Calumet & Hecla will produce about the same as last year. The Quincy will increase its output by 1,000,000 pounds. The Wolverine will show an increase.

BARAGA COUNTY.

It is reported the management of the Michigan has been successful in obtaining the stamp millsite it has been seeking, adjoining the Mass mill at Keweenaw Bay, and that it will ship rock over the Mineral Range road permanently.

HOUGHTON COUNTY.

The management of the Centennial mine, near Calumet, is preparing to move the machine, blacksmith and carpenter shops from the old shafts on the Calumet conglomerate to A shaft on the Kearsarge amygdaloid. The shafthouse at A shaft is to be torn down and will be replaced by a structure capable of storing 2500 tons—enough to run two heads of stamps at the mill for two days. B shaft has been opened from a depth of 1100 feet up to a point below contact between the ledge and the overburden, or 100 feet from the surface. A shaft is down 2600 feet and sinking has resumed. Both are three-compartment shafts. B shaft is not to be holed through at present. The bottom drift runs north 180 feet and south 155 feet. The eighteenth level drift in the last 400 feet run shows good ground. It is approaching the South Kearsarge line. The drift may be cut through in order to give better ventilation to both mines as in the case of the Wolverine and Kearsarge mines farther north.

The May output of the Champion and Baltic mines, near Houghton, passed all previous figures, being: Baltic 668 tons and Champion 691 tons.

The output of the Atlantic mine, near Houghton, for May was 327 tons, 1045 pounds, the greatest month's return in the history of this mine. This shows an increase in the value of Atlantic rock, as there has been no increase in the number of stamps dropping.

KEWEENAW COUNTY.

The management of the Allouez mine at Allouez say they can sink two shafts 1700 feet apart on the Kearsarge lode to depth of 9900 feet. Only the one just started will be sunk at present, but if the lode shows the expected values a second will be sunk 1700 feet to the northeast. The shaft will sink through 1000 feet of barren ground before reaching the lode when the angle of 80° will be changed to the angle of the lode by an easy curve to make easy riding for the skips. The shaft started is close to the extreme southern corner of the property. Surface sites have been bought from the Ahmeek to the east and the Osceola to the south, on which the engine and boiler house will stand. Alongside the permanent three-compartment shaft a temporary pump shaft will be sunk to the ledge in advance, in which the pump will care for the water, thus relieving the men in the working shaft from that trouble. The foundations for the engine house are laid and the timbers framed. The boiler house will be 50x29 feet and 14 feet to the wall plates. The boilers are on the ground. The temporary hoist used will

do until the hoist used at the Centennial "A" shaft where it carried down 2600 feet is set up.

ONTONAGON COUNTY.

The Victoria M. Co. dam, near Victoria, has been well tested by the heavy rains and spring floods this year and also by several million feet of logs sent over it. The race, 50 feet wide at top and 16 feet at bottom and 12 feet deep, is expected to be finished by July 15th. The water power is delivering 5000 H. P. The mill foundations have been begun. The building will be arranged for two heads at start. Underground operations show the lode well mineralized. The shaft reached the nineteenth level last week. The Victoria makes the first shipment of copper to smelters this season—92 barrels, or 50 tons barrel copper, and 10 tons small masses.

MONTANA.

The receipts of gold and silver at the United States Assay office at Helena for May showed \$184,598.14 in gold and \$870.27 in silver—a total of \$185,828.41, as compared with a total of \$153,402.67 for May, 1902. Montana mines sent in \$162,451.59. The following table shows the receipts of the three chief gold-producing counties of the State for 1903 and 1902:

	1903.	1902.
Fergus	\$95,496 39	\$19,082 25
Madison	23,276 20	12,427 99
Lewistown and Clarke...	21,523 24	34,090 26

Fergus county's gain is due to the fact that a number of mills there are working at practically their full capacity, and the gold ores of Fergus county are largely adapted to the cyanide process.

CASCADE COUNTY.

The Gerber mine at Sand Coulee is making preparations to increase its production of coal, for which it finds a market with the Boston & Montana smelters at Great Falls. The management has built a boiler-house at the entrance of the mine and is putting in four 90 H. P. boilers, one 250 H. P. engine, one 12 H. P. engine, one 24-inch compressor, six new drills, six coal cutters and two pumps. They expect to have the plant in operation next week. With this machinery they expect to turn out 700 tons of coal a day.

CHOTEAU COUNTY.

I. Myers, J. T. Morrow and R. Copper of Lewistown, O. P. Chisholm of Bozeman and F. Truchot, J. W. Shields and J. G. Bair of Choteau have filed placer location notices on 2080 acres of iron-bearing lands on the Ralston buttes, 10 miles northwest of Choteau. The ore is magnetic iron and lies in a bed from 2 to 12 feet thick. The properties have been but slightly developed as yet.

FERGUS COUNTY.

Men have begun work on the Surprise group, near the mouth of Spotted Horse canyon, near Lewistown. The Surprise group is under bond to A. P. Pendleton et al. of Chicago, Ill., with W. E. Wilson of Maiden as superintendent.

FLATHEAD COUNTY.

Operations at the Snowshoe mine, near Libby, have resumed, after being idle several months. Last year the company sunk a shaft from the lowest tunnel 350 feet. Little drifting has been done from this shaft, and it is intended to explore the ground both ways from this shaft before doing any more sinking.

MADISON COUNTY.

The Pacific mine, near Virginia City, has twenty-five men on the payroll, and the mill started in last week on a one-shift run, but a night shift will be put on as soon as the warm weather starts more water. Men will be put on also at the Easton.—W. Suidow and P. McGovern, who have a lease on the Mapleton mine at Adobetown, report making a 200-ton shipment last week of ore assaying \$40.

MISSOULA COUNTY.

The Tarbox lead-silver group, 3 miles up Packer creek, near Saltese, says R. Daxon of Wallace, president and manager, has twenty-five men at work. The company has a heavy hoisting plant. The men are sinking the main shaft, now down 300 feet, to the 450-foot level, where a crosscut will be run to the lead 25 feet. Previous to sinking the company was drifting on the lead, both east and west from the 225-foot level. Each drift has been run 200 feet and in concentrating ore.

The Monitor-Richmond group, 5 miles up Silver creek, south of Saltese, report work progressing. The Richmond has been developed by three shafts, each 500 feet apart, and on the ledge, which carries copper-gold running 15% copper and \$15 gold. Drifts have been run on the lead from the 200-foot level. The Monitor group of ten claims, adjoining the Richmond, carries similar ore. Shipments have been made. There is a 14-foot vein

of sulphide ore. At present the groups are held under bond by the Bitter Root C. M. Co., some of the principals being S. S. Secor and L. G. Beebe of Winnebago, Minn., and H. Welch, State Coal Mining Inspector of Montana. Negotiations are pending for building a \$250,000 smelter at Saltese this summer, being backed by those interested in the Monitor-Richmond group. There are enough properties in this district to keep the reduction works supplied. When the works are completed, the Monitor-Richmond Co. will build an aerial tram to the smelter, a distance of 5 miles, getting the ore to the works for 30 cents per ton, while it costs \$3.50 to haul it by wagon.

SILVER BOW COUNTY.

The mines of the Alice M. Co. at Walkerville are to be equipped with a plant to reduce its argentiferous zinc ore and zinc tailings into commercial form, says Manager Quint at Butte. The parties interested are connected with the zinc plant at Park City, Utah.

NEVADA.

LINCOLN COUNTY.

Superintendent A. A. Ross of the Southern Nevada mine at Searchlight reports opening up the lead in a winze in the workings south of the main working shaft. This shaft was sunk a short distance some time ago and then abandoned. Later it was cleaned out and sinking resumed, and at 65 feet they cut a lead going down at 65° which is 4 feet across. On the foot wall is a shoot of rich ore, but the whole ledge will mill \$15 per ton.

At the Duplex mine, at Searchlight, in the crosscut being run from the Searchlight shaft towards the New Year's Gift, Manager F. P. Swindler reports they have found the lead they had been hunting for. The mine and mill have closed down since on account of the labor situation.

Superintendent F. J. Harrington of the Quartette M. Co., at Searchlight, has closed down their mines and mills because the miners went on a strike due to the order posted that nine hours would be required of all employees not affected by the State eight-hour law. But three men were affected. The foremen are running the pumps. The Good Hope mine is also closed.

LYON COUNTY.

F. E. Shaw of San Francisco, Cal., manager of the Excelsior M. Co., and J. R. Mackay, secretary of the Douglas M. & S. Co., are reported as saying that there is a deal on foot whereby the Douglas Co. will take over the property of the Excelsior Co. at Yerington, consisting of mining claims, smelter, pump plant, telephone line, buildings, etc. The Douglas Co. will make a run of ore from their mine at the smelter next week, and if it proves satisfactory the plant is expected to be moved to the Douglas ground, where additions will be made to it and the reduction of ore begun. The gasoline hoist at the Blue-stone has been removed to the Douglas and set up. Sinking will begin next week.

NYE COUNTY.

Shipments of argentiferous galena and carbonate ores continue from the Lynch & O'Meara mines at Lone Mountain, near Tonopah. The company has twenty-three men at work, and the product forwarded to Salt Lake smelters amounts to a carload per month, values running from \$140 per ton. The workings are 100 feet from surface, the ledge varying from 10 inches to 3 feet in width.

Operations at the Rescue mine, at Tonopah, are progressing since the steam hoisting plant has been in operation. The shaft is down 250 feet and will continue to 500 feet before drifting or crosscutting is begun.

The Boston-Tonopah M. Co., at Tonopah, has bought the Broadstreet claim, which joins the Reptile on the east and the Sparrow claim of the Mizpah Extension on the north. At depth of 220 feet the Boston-Tonopah shaft continues in brown porphyry, which was struck at 185 feet after dropping through the blue porphyry struck at the 120-foot level.

The Tonopah-Bouquet M. Co. of San Francisco, of which R. Kern is president, is preparing to begin development work on its ground near the Little Tonopah mine, 1½ mile northwest of Tonopah. The group consists of four claims. A double-compartment shaft will be sunk.

WHITE PINE COUNTY.

The Muncy Creek mines, near Cherry creek, have been incorporated under the name of the Grand Deposit C. M. Co.

W. A. Watson and P. Jackson are building a 5-stamp mill on their Joanna ground in Cocumungo, near Cherry creek. Work will begin next week on building a mill for the Wide West mine at Cherry Creek.

The shaft at the Pilot Knob copper mine at Ely is being sunk from the 500-foot level to the 600-foot.

NEW MEXICO.

GRANT COUNTY.

The Superior Co. of Lordsburg have leased their mines to parties represented by J. J. Bruck of El Paso, one of the stockholders of the company.

OREGON.

BAKER COUNTY.

E. J. Thorp, superintendent of the Blue Bird mine, near Sumpter, says the 6-drill compressor plant is being set up and development work will resume next week. Plans for a reduction plant are being drawn up. The drift has been driven 300 feet on the ledge, which two crosscuts have shown to be 20 feet wide.

J. J. Hennessy, manager of the Gold Bug Grizzly mine, near Sumpter, started men at work last week. They will resume sinking in the shaft, which is down 100 feet, and go to the 300-foot level, cutting stations at each 100 feet and crosscutting to the parallel ledges, drifting both ways. The shaft is between these two veins, which are 70 feet apart. The mine is equipped with machinery, consisting of a hoist capacity for 700 feet, a 26 H. P. engine, a 50 H. P. return tubular boiler, and pumps.

Superintendent McPhee resumed work on the Golden Wizard mine last week. He is drifting on the tunnel level. The shaft had to be temporarily abandoned on account of water. L. O. Miller of Three Rivers, Mich., president of the Golden Wizard Co., says plans are being drawn for the stamp mill to be erected this fall. It is expected to be of 10-stamp capacity to begin with. The three-compartment shaft will be started when the mill is ready for operation.

Reports from the California mine, near Baker City, owned by the Turnagain Arm M. Co. of Minnesota, say the breast of No. 1 tunnel is in \$96 gold ore. Manager Bellman estimates there are 50,000 tons of \$10 ore blocked out in the workings.

Baker City reports say the Weatherby Bonanza G. M. Co., owning the Weatherby Bonanza mine, on south slope of Lookout mountain, near head of Sisley creek, has been reorganized, and B. E. Wright, R. W. Foster and W. W. Gibbs are officers.

MALHEUR COUNTY.

The 20-stamp mill at the Black Eagle mine, near Malheur City, which was closed down owing to lack of fuel, was started up again last week. Ore is mined and milled at the Black Eagle at a total cost of 90 cents per ton, says Manager Meikle, and the ore averages \$350 per ton on the plates. The ore is quarried from a porphyry dyke, broken down through upraises from an adit level into cars and trammed direct into the mill hopper. The manager reports his company will increase the stamp capacity of the Black Eagle to 100.

SOUTH DAKOTA.

LAWRENCE COUNTY.

A consolidation is reported at Deadwood of the Ak-Sar-Ben G. M. Co., the University G. M. & M. Co., Iron Duke M. Co., Bunker Hill M. Co. and Monarch M. & M. Co. Most of these properties are in Lawrence county, but the University Co. has mines in Custer Co. also. A new company is to be organized to absorb the interests of the above companies, and work will be begun this month on a 300-ton cyanide plant. A water right has been acquired in the purchase, which will furnish water sufficient for a 1000-ton plant. Both the Burlington and Northwestern Railroads are to be extended to the millsite.

D. N. Helser, of Denver, Colo., president of the Spearfish M. Co., operating near Spearfish, says the value of the cleanup for May was \$42,000. The Spearfish Co. milled 54,000 tons of ore during the first year of the new mill's operations (concluded last month). It showed the average value of the savings to be \$5.28 in gold to the ton, and that the mill was extracting 80% of the values contained in the ores.

UTAH.

BEAVER COUNTY.

Four electric drills are being operated at the O. K. mine of the Majestic C. Co., near Milford.

The 90-foot smokestack at the Majestic smelter at Milford has been completed and the men are building the trestle approaches to the ore bins and setting up machinery, says Manager W. A. Farish. There is still considerable work to be done before the plant is ready.

P. B. McKeon reports last week locating a bed of sulphur near the hot springs, near Milford. The deposit is a whitish substance, with which pure sulphur is mixed, and there is apparently a large body of it. The deposit will be developed. Developments are progressing at the

Success mine in Beaver Lake district, near Milford, says Manager Lane. They are opening up a 15-foot vein of ore that averages 5% in copper across its entire width, with portions running 14%. A shaft has been started on the ore body.

The Royal Co. Co. will put in five gasoline bolting engines to be used in the development and operation of as many of the company's groups of mining claims near Milford. Three of the machines will be 40 H. P., another will be 60 H. P. and the fifth, for prospecting purposes, will be 15 H. P. Except the last one, they will enable the Royal Co. to operate to depth of 1500 to 2000 feet.

J. Botkin, president and manager of the Old Catawba Co., operating in Beaver Lake district, near Milford, says the company owns three groups, comprising sixteen claims, and they are opening up a showing of copper assaying 12% copper, 7.4 ounces silver and \$3 gold. A working shaft is being sunk on the Copper King group.

CACHE COUNTY.

I. A. Jones, superintendent of the Reeder mine, has a contract at the Amazon mine in Logan canyon, near Logan, to drive the tunnel ahead, says Manager H. C. Hansen. The tunnel is in 225 feet.

GARFIELD COUNTY.

It is reported Kimball & Turner propose to build a stamp mill on their mines in Henry Mountains district, near Hite, during the summer. C. Gibbons of Hanks-ville has bought an interest with them. The ores show \$15 gold per ton.—M. Perky, at the Bromide group, has men at work on a tunnel. Owing to the hardness of the rock, driving has been slow.

IRON COUNTY.

The principal office of the Johnny Co., operating at Stateline, has been removed to Salt Lake City, and Manager Dooley will, in the future, have his headquarters there.

The Blue Jay Extension M. Co. will begin hauling its initial shipment of ore to the Salt Lake smelters, says President F. Sugden at Salt Lake. The vein struck by the main drift contains a streak, measuring 10 inches wide, assays showing values of 706 ounces silver, 33% lead, 54% copper and \$4 gold. Six feet of the width of the vein contains ore of a sufficient grade to ship in the crude. A 35-foot up-ramp has been made, showing the ore to continue. Later the up-ramp will be continued to the surface and a gasoline hoist put in. The ore will be hauled to Lund or Modena for shipment over the Oregon Short Line.

JUAB COUNTY.

The annual report of the Uncle Sam M. Co. at Eureka shows there was marketed during the period from July 14, 1902, to June 1, 1903, 3039 tons of ore, for which the company received \$47,188.26 net. At the conclusion of the regular report, plans for the erection of a mill to concentrate the low-grade ores were submitted by Manager Chipman.

The concentrator at the Tesora mine, near Eureka, is to be removed to the mouth of the Dalton & Lark tunnel at Bingham. The machinery includes three concentrating tables and two vanners.

Ore shipments from Tintic district for month of May reached a total of 632 cars, the principal shippers being: Bullion-Beck, 26 cars; Carisa, 18; Centennial-Eureka, 144; Dragon iron mine, 99; Gemini, 62; Grand Central, 104; Lower Mammoth, 18; Mammoth, 49; May Day, 2; Star Con., 13; Uncle Sam Con., 11; Victor, 30; Yankee Con., 31.

PIUTE COUNTY.

Two cars of iron ore are going out regularly from the Iron mine, near Marysville, says Superintendent F. E. King. The tonnage will be increased as fast as room can be made for more men.

SALT LAKE COUNTY.

(Special Correspondence)—The United States R. & R. Co. of Colorado City, Colo., will build a 300-ton plant near Salt Lake City. Colorado City, Colo., June 8.

Work was begun on the Chicago mine at Bingham last week by the new company, with S. W. Mosby as superintendent.

Managing Director A. F. Holden of the United States M. Co. says the system of automatic feeding at the furnaces in their smelter at Bingham has been taken out and replaced by hand feeding.

The Bingham Bulletin reports a heavy flow of water struck in the Silver Shield lower tunnel, near Bingham, which gives assurance that the upper workings will soon be drained so that sinking can be resumed.—E. Hill has a bond and lease on the Tough Nut claim, at the mouth of Markham gulch, and has started men on development work.

O. A. Palmer, engineer for the Ontario M. Co. at Bingham, says on the 2000-foot level connection has been made with the

ore body, showing values in silver and lead, with but little zinc. The company will build a concentrating mill.

The Utah Copper Co. has incorporated at Colorado Springs, Colo., with R. A. F. Penrose, Jr., C. M. MacNeill, D. C. Jackling, C. L. Tutt and S. Penrose as directors. The principal office of the company will be in Colorado Springs. The company was organized to take over the De Lamar-Wall group of copper mines near Bingham.

All four furnaces of the United States M. Co. smelter at Bingham are again in commission, the machinery having been overhauled. The mine is delivering ore at the smelter at a lower cost than ever before.

SEVIER COUNTY.

At the Sevier mine of the Sevier Con. M., M. & P. Co., in Gold Mountain district near Richfield, Superintendent H. C. Lawrence has work under way on the equipment. Remodeling of the stamp mill and the addition of machinery will precede the building of cyanide and leaching plant. A mill will be built at the Mammoth mine, of which J. Long is manager. The Holland mine, below the Sevier, resumed, and ore is being opened up.

J. M. Billingsley, of Joseph, says at the B. W. & H. another vein has been struck 1200 feet west from the mouth of the lower tunnel, on which most of the development work has been done, and on the J. M. ground. A surface crosscut of 28 feet has been made across the vein and a shaft started. On the surface the ore assays \$2 and the bottom of the shaft last week showed values of \$3.

SUMMIT COUNTY.

Park City reports say the future of the zinc separating plant at Park City, which was destroyed last month by fire, is to depend on the granting of an extension of the contract with the Daly-Judge M. Co. The contract by which they were operating on the zinc contents of the dump at this mine has less than a year to run.

TOOELE COUNTY.

The Denver M. Co. of Salt Lake has incorporated; J. H. Harlick, W. Maddison, officers. The company owns the Denver lode and five other claims in the Willow Springs district.

With 4000 tons of ore in its bins, the stamps at the Mammoth Co.'s mill at Robinson have begun dropping again.

At Clifton, near Ibapah, in Deep Creek district, J. H. Wolcott and W. Carman, owners of the Pole Star group of copper, silver and lead-bearing mines and the Troy, a gold-bearing proposition, report work progressing. On the Pole Star a shaft has been sunk in ore to depth of 200 feet, at which point a full face of ore is exposed, showing an average of 7% copper and \$6 gold per ton. There are two other ledges for which a crosscut will be started, one of them carrying lead and silver ore, with some gold. On the Troy group a shaft has been sunk to depth of 50 feet.

WASHINGTON COUNTY.

The furnace with which the Dixie group of mines, near St. George, is equipped is producing 12,000 pounds of copper bullion daily, says Manager Beveridge.

WASHINGTON.

OKANOGAN COUNTY.

The Agnes M. Co., through Manager E. W. Beidler, has bought ten placer claims on the north fork of Mary Ann creek, in Myers Creek district, near Concanully. The Agnes Co. is placing sluice boxes on the Red Gauntlet claim and will mine out the creek bed along this fork of Mary Ann creek. The Agnes Co. is composed of New York men.

STEVENS COUNTY.

The Washington group of claims, near Hall's Ferry, 18 miles northwest of Bossburg and 4 miles south of the international boundary line, has resumed work. The development consists of open cuts and tunnels aggregating several hundred feet. The open cuts are run along the trend of the ledge and in each one ore has been exposed. There are two adits 100 feet each in length on the vein, each showing silver-lead ore. Concentrates carry lead 47% and silver 29.6 ounces. The Washington group is in the western portion of Pierre Lake district, 2 miles from the Little Giant mine, and is owned by C. Ward of Bossburg, C. Brooks of Marcus, D. I. Donovan of Spokane. It is intended to build a concentrator at the mines to treat the low-grade ore, while the high grade ore will be shipped as mined to the smelter.

A. W. Holland, president of the Yellow Jacket M. Co. of Spokane, says a strike has been made on the Yellow Jacket claim at 80 feet in the tunnel showing 2 feet of smelting ore. The Yellow Jacket mine is owned by Spokane men and is 6 miles from Marcus and 4 miles from Bossburg, being

between the Columbia and Kettle rivers and within 1 mile of the Washington & Great Northern Railroad.

WISCONSIN.

SAUK COUNTY.

Deposits of high-grade iron ore are reported located near North Freedom. Work is being done from a point west of North Freedom to within a few miles of Baraboo, and explorations are to be made in territory east of Baraboo. The principal operator in the iron fields is the Illinois Iron M. Co. of Chicago, Ill. While the work of actual mining has not begun, 4000 tons of ore have been taken from this mine and are on the dump, having been taken from the mine in the work incidental to drifting and crosscutting. The exploration of this ground was made with a diamond drill and the ore deposit was struck at depths ranging from 100 to 300 feet. At present the work is being done on a deposit 100 feet wide, consisting of 40 feet of shipping ore and 60 feet of concentrating ore.

WYOMING.

CARBON COUNTY.

A plant of machinery and electrical apparatus are being installed at the Elk Mountain M. & M. Co. mine on Elk mountain, near Grand Encampment.

At Battle Lake twenty-five more men were taken on at the Ferris-Haggerty copper mine last week; and the output is being increased. It is reported men will be put to work sinking below the tunnel level, and a winze will be sunk to a depth of 500 feet with crosscuts and levels at every 100 feet. It is expected the tramway buckets will begin to carry the ore to the smelter at Grand Encampment next week.

UINTA COUNTY.

The Atlantic & Pacific Oil Co., operating in Spring Valley field, is reported to have struck a flow of oil at a depth of 870 feet.

FOREIGN.

AFRICA.

RHODESIA.

The March output for Charterland is declared by the Rhodesian Chamber of Mines at 19,626 ounces, 5.95 pennyweights, in value £68,651. This shows an increase of 2537 ounces over February, says the South African Miner. The summary of the analysis is as follows:

	Ozs.	Dwts.	Value.
From mill.....	15,208	6.10	\$55,460
From tailings.....	4,263	10.20	12,650
From other sources.	154	9.65	541
Totals.....	19,626	5.95	£68,651

Scarcity of water accounts for the Eagle Vulture's short run. The Geelong crushed 1676 tons of its own ore, while 343 tons were taken from ancient surface dumps, and 1783 tons from valley development dumps. Twelve tons of concentrates from the Beatrice mine produced an assay value of four ounces per ton. Dry crushing rolls, of a 50-stamp battery capacity, are used on the Wanderer mine, which heads the list of tons milled.

TRANSVAAL.

On the North Rand water is abundant, and on Wilgespruit, where the North Rand "A" property is situated, four or five prospecting shafts and a number of pits and trenches have proved the formation to a small depth, says the South African Miner. In No. 1 shaft a 6-foot ore body has been noted and the shaft is down 115 feet. Drives have also been extended to test the country. At surface the shales are interbedded with the ore body and the formation is hard to follow, but the stratification becomes more defined as the formation is opened up in depth. The reef, which shows free gold in places, appears to consist of a ferruginous crystalline quartzite with jaspery enclosures, and interbedded and interlacing shales at surface. The reef exhibits slight breaks in places, but the general conformability of the strata shows the reef to be regular. Good values are obtained from the green quartzose shale foot wall. A little to the north of these beds the Hospital Hill shales occur. North of this the Du Preez series outcrops have been located, and it is assumed that the series continues throughout the range, which runs regularly along the strike of the North Rand "A" reef.

BRITISH COLUMBIA.

J. F. Wardner, managing director of the Cherry Creek G. M. Co., near Vernon, in Yale-Cariboo district, says machinery for the stamp mill is on the ground. Development work is going ahead and a large tonnage of ore is ready for crushing.

Among the mines which are again starting up near Ymir are the Elise and the Empress of India. The Elise has been

handed to N. J. Hawkins for \$50,000. It is proposed to begin shipments this month. The Empress of India has started up under direction of J. W. Ross of Ymir, who has handed it in the interest of a Buffalo, N. Y., company.—Work has been resumed on the Mayhlossom on Quartz creek, owned by J. F. Harbottle and others.—The Atlin M. & M. Co. has begun operations on the Nome, and the first shipment of ore will be made this week.—The last returns from the Ymir mine at Ymir are as follows: Sixty stamps working twenty days crushed 4550 tons of ore, producing 1235 ounces of bullion, valued at \$13,900. Concentrates shipped amounted to 218 tons, valued at \$5750. At the cyanide mill 3050 tons were treated, producing \$2750. The working expenses for the month were \$18,685, and expenditure on capital amount \$3200. Sundry receipts amounted to \$945, being a net profit of \$1460. The manager reports also that during June a saving of expense will be made in consequence of water power becoming available. The ore on the fifth level has improved in value and averages \$10 per ton.

W. Blakemore, consulting engineer of the British Columbia Coal Co., Ltd., reports awarding a contract for building a pack trail to the company's coal locations near Grand Forks, which are to be prospected with a diamond drill plant previous to opening up development work.

The Horseshoe mine on Trout creek, near Ferguson, has been sold to G. W. Stead, manager of the Philadelphia company operating the Lucky Boy and Ethel mines. Developments on the Lucky Boy show the vein which first lay at an angle of 25° has changed up to 45°, with a tendency to approach the vertical. Though only 40 feet from the surface, they are stopping out from a shoot of 7 inches of gray copper running 800 ounces silver to the ton. This shoot in another place has enlarged to 3 feet of mixed galena and gray copper, with iron sulphides, carrying some gold values and averaging 400 ounces silver. The drifts east and west on this body are in ore.

A. Smith, of Kaslo, has a bond on the Gibson group, on the South Fork of Kaslo creek, and has put miners to work opening up the ore body.

CANADA.

NOVA SCOTIA.

The Dominion Coal Co. have at Glace bay another pump put down into Dominion No. 1 mine. Since pumping began the water has been lowered 15 feet. Conditions are said to be favorable for making good headway. The mine was flooded this spring on account of fire, underground.

CHINA.

Shanghai advices to the London Times say the London-China Syndicate has secured from the Mang-Whey provincial authorities a concession to work the copper and other mines in certain districts of Mang-Whey.

MEXICO.

DURANGO.

E. H. Stanley et al. of Detroit, Mich., have bought a group of mines 100 miles from Durango, at a place called Yerba Buena. The group includes the America, Bunker Hill, Mosa and Soheralante, the last named being a continuation of the Mina Grande, from which the owners are shipping high-grade ore.

JALISCO.

At Etzatlán the Candelaria mine is showing the ore body 6 feet wide and assaying five kilos silver and forty grams gold. This property is owned by the San Miguel M. Co. of New York, with F. W. Harrell as manager.—Carral & Kratz are putting in a 20-ton plant for their mine near Etzatlán, which is expected to be running by Sept. 15.

MEXICO.

Cia. El Progreso y Anexas has been organized to operate a group of mines adjoining the Dos Estrellas mine at El Oro. Their holdings include El Progreso, El Polar and La Joya. These properties have been bought for \$176,000, and are equipped with machinery. The main shaft, three compartments timbered throughout, has been sunk to depth of 100 meters under Manager H. C. Sandifer. The organizers are F. J. Fournier, J. R. Azpe, J. C. Mordough, H. C. Sandifer, E. Calvayrac and R. Pardo.

SAN LUIS POTOSI.

The Los Charcos M. Co., the principal stockholders of which are in Monterey, has bought the Oriental mine, near San Luis Potosi. The ores carry silver and copper.

It is reported from San Luis Potosi a railroad 8 miles long is being built by the San Luis Smelter Co. from Molares to the San Pedro mines. New machinery is

being put in at these mines for hoisting and extracting ores.

SONORA.

The Nogales Copper Co. has bought the Cerro Prieto mines and stamp mill near Magdalena for \$600,000. A cyanide plant will be built and development work increased.

The Mexican-American M. & D. Co., operating the San Ricardo mine, 30 miles east of Paza, in Ures district, have put up a 5-stamp mill at the mine. A hoisting plant, engine, pump, etc., will be put in, says J. C. Dickey of Denver, Colo., manager. The old workings have been cleaned out and 900 feet of railway tracks laid for the operation of coal cars through the tunnel and other parts of the mine. L. D. Phillips is mine superintendent. Bodies of free-milling gold ore have been blocked out.

F. J. Toussaint of Milwaukee, Wis., who is operating the Plomosa mine near Huepac, reports machinery on the ground for a reduction plant. It includes a 5 stamp mill, with pans, Cornish rolls, concentrating jigs and tables, and a 36-inch smelting furnace. On the Plomosa, Toussaint has 2000 feet of development work done.

RUSSIA.

LAPLAND.

Stockholm advices report that negotiations are pending which may result in a \$50,000,000 purchase by the United States Steel Corporation of the entire iron mines in Lapland. The present owners of the Lapland mines are stockholders of the company of which G. E. Broms of Stockholm is president.

SPAIN.

London reports say Spain exported during the three months ending March 31 34,923 metric tons of lead (of 2204.6 pounds each), as compared with 34,206 tons for the corresponding period in 1902 and 28,755 tons in 1901.

PERSONAL.

C. O. LAGERFELT of El Paso, Tex., is at Camargo, Chihuahua, Mexico.

S. W. MOSBY is superintendent of the Chicago mine at Bingham, Utah.

C. M. FUELLER of Denver, Colo., is in Deadwood, S. D., on mining business.

H. A. TITCOMB, associated with A. C. Beatty, of Denver, Colo., is in Europe.

F. HARTLEY is superintendent of the Chicago mine at Penryn, Placer county, Cal.

H. J. STEVENS of Houghton, Mich., is visiting mines in Arizona and New Mexico.

N. E. GUYOT is manager of the Custer M. & Realty Co. properties near Custer City, Colo.

H. Z. OSBORNE, U. S. Marshal at Los Angeles, Cal., has gone to Mexico on mining business.

H. N. ELMER, Chicago manager Trenton Iron Co., has returned there from Denver, Colo.

J. D. BASCOM, of Broderick & Bascom Rope Co., St. Louis, Mo., was in Denver, Colo., last week.

J. H. HAMMOND, who has been examining mines at Tonopah, Nev., has gone to New York City.

A. J. McDONELL, a mine superintendent of Virginia City, Nev., is in San Francisco, Cal., on business.

F. C. COOLEY, Western sales agent Baker & Adamson Chemical Co., Easton, Pa., is at Santa Cruz, Cal.

A. BARNABY returned to Bisbee, Ariz., last week from a two weeks' trip into Mexico on mining business.

R. L. LLOYD, until recently of the Boston & Montana smelter at Great Falls, Mont., has gone to Mexico.

H. JOUANEN of Mexico City, interested in mines in Mexico, is spending some time in Denver, Colo., and vicinity.

P. F. CROWLEY of Clifton, Ariz., left last week for Cripple Creek, Colo., and the East as far as Milwaukee, Wis.

J. S. McCULLOUGH is manager of the Standard M. & M. Co., operating at Marysville, Plute county, Utah.

J. A. CRONKHITE returned last week to Chihuahua, Mexico, from a trip to St. Louis, Mo., on mining business.

D. McVICHIE, manager of the Bingham Con. M. Co. of Bingham, Utah, is in the East from Salt Lake City, Utah.

A. C. BELL, contracting engineer of the

Wisconsin Bridge Co., has returned to Denver, Colo., from Clifton, Ariz.

J. BROCK of Philadelphia, Pa., president of the Milpah Extension M. Co., is visiting their mines at Tonopah, Nev.

W. J. DOOLY, manager of the Johnny mine at Stateline, Utah, has moved his headquarters to Salt Lake City, Utah.

T. J. HOOVER, E. M., has been appointed assistant superintendent of the Standard Con. G. M. Co. at Bodie, Cal.

JOHN LAWLER of Prescott, Ariz., and a large mine owner in the Territory, has returned home from San Francisco, Cal.

MANAGING DIRECTOR A. F. HOLDEN of the United States M. Co. of Bingham, Utah, is in the East on company business.

R. S. McCAFFERY is manager of the Grand Deposit group of mines, Muncie creek, near Aurum, White Pine Co., Nev.

G. F. BATCHELDER of Minneapolis, Minn., is in Denver, Colo., looking after his mining interests throughout the State.

G. H. ROBINSON, manager of the Tintic M. & D. Co., returned to Salt Lake City, Utah, last week from British Columbia.

R. B. McCONNEY, engineer with Holt-hoff Machinery Co., Milwaukee, Wis., was in Denver, Colo., the past week on business.

W. H. GRAHAM, interested in mines in Argus Range, near Randsburg, Kern county, Cal., is in Los Angeles, Cal., on business.

R. C. SHAW, general manager of the Thayer M. & M. Co. of Miramar, Costa Rica, C. A., has gone to New York City on business.

R. J. ANDERSON, manager of the G. & S. E. Co. of America, Ltd., Denver, Colo., is in Scotland on business connected with his company.

T. A. ROGERS of Mountain View, Cal., manager of the Mira Monte M. Co., is at Aspen Grove, Similkameen district, British Columbia.

A. M. JENNINGS of Buffalo, N. Y., president of the Southern Nevada M. Co. at Searchlight, Lincoln county, Nev., is at their mines.

SUPERINTENDENT P. J. McGUIGAN of the Alamo M. Co. is in Spokane, Wash., on company business from Alamo, Grant county, Or.

J. W. GRAHAM of Denver, Colo., is president of the Elkton Con. G. M. Co., operating at Cripple Creek, Colo., vice G. Bernard, resigned.

H. C. BOSWORTH, manager Denver Fire Clay Co., Denver, Colo., is on a trip through California, Oregon, Washington and British Columbia.

G. BERNARD of Colorado Springs, Colo., has resigned as president and director of the Elkton Con. G. M. Co., operating at Cripple Creek, Colo.

T. E. SCHWARZ, mining engineer of Denver, Colo., has returned there from a trip to Chihuahua, Mexico, where he was examining mining property.

W. H. BREVOORT, president and general manager of the Greenback mines and mill near Grant's Pass, Josephine county, Or., returned last week from a trip East.

F. BUTLER, former superintendent of the Chainman mine at Ely, Nev., has a similar position with the Utah & Eastern C. Co., near St. George, Washington county, Utah.

E. J. BONSTELL, who has been conducting cyanide experiments on sulphide concentrates at the Mount Jefferson mine, Groveland, Cal., has returned to San Francisco, Cal.

J. H. HUTCHISON, formerly connected with the Trade Dollar mine at Silver City, Idaho, will leave for Alaska this month to examine mining properties for Philadelphia parties.

G. W. MYERS, Pacific coast representative of the Chrome Steel Works of Brooklyn, N. Y., has returned to San Francisco, Cal., from a business trip to Douglas Island and Juneau, Alaska.

H. E. NELSON, for some time past engineer with the American S. & R. Co., has resigned and accepted a position with the United States R. & R. Co., with headquarters in Salt Lake City, Utah.

A. VAN DER NAILLEN, C. E., of San Francisco, Cal., has been decorated by Leopold, King of the Belgians, "Chevalier of the Order of Leopold," in consideration of his distinguished services as an educator.

A. GLASSBROOK, for several years identified with the mines of Aspen, Colo., and until recently with the Park City Metals Co. zinc plant, Park City, Utah, is with

the Mines & Smelter Supply Co. at Salt Lake City, Utah.

J. D. SEITZ AND E. J. STREET of Kansas City, Mo., of the Lucky Tiger M. Co., operating in Sonora, Mex., returned to Kansas City last week from Mexico.

Commercial Paragraphs.

THE Mide & Smelter Supply Co., Denver, Colo., report the sale of twenty Wilfley tables to the Montana Ore Pur. Co., Butte, Mont.; two Wilfley slime tables to the North American Copper Co., Grand Encampment, Wyo.; three Durkee electric drills and gasoline plant to Alaska.

THE Jeannette Iron Works Co. of Jeannette, Pa., manufacturers of mine pumps, report shipping to Mexico through their Denver branch an electric power pump for 1000 feet lift, being the last one of six ordered. They have also shipped to Mexico a compound steam pump for 1600 feet lift.

THE Gardner Electric Drill & Machinery Co., E. C. Means, Western manager, Denver, Colo., report success with their electric drills. They recently received a contract from the Denver, Northwestern & Pacific Ry., Denver, Colo., for twelve of their drills and orders for several more. This is the result of extended tests to demonstrate to the contractors the ability of the Gardner drill to do the work required.

THE Chrome Steel Works of Brooklyn, N. Y., G. W. Myers Pacific coast agent, San Francisco, Cal., report closing a large contract with the Alaska-Treadwell M. Co., Alaska, for chrome steel shoes; also, a contract to equip the Ebner G. M. Co. at Juneau, Alaska, with Canda cams and chrome steel parts for a 100-stamp mill. G. W. Myers reports also equipping the mill of the Bagdad M. & M. Co. at Barstow, Cal., with Canda cams.

TESTS made by C. W. Weiss at the Metz & Weiss engine works, 128-138 Mott street, New York City, with Cuban and Brazilian cheap alcohol as fuel in their standard kerosene engines, have been reported as satisfactory. The object was to substitute alcohol for kerosene, the former being cheaper and more readily obtainable in Cuba and South America, to which places they report many of these engines are being exported. It was found that a mixture of four parts alcohol and two parts water developed 4 H. P. for one hour. The mixture of alcohol varies, however, with the quality of the former, being limited by the practical degree of compression prior to combustion. The specific gravity of the mixture is .9, the pure alcohol was .794. The development of the alcohol engine is of importance to the power question of Cuba, Brazil and the Philippine Islands.

THE Lagonda Mfg. Co. of Springfield, Ohio, reports the month of May to have been the best they have had since they commenced the manufacture of their tube cleaners. The demand for these machines, they say, is growing. They have been crowded out of the factory which they have been occupying for the past year and have built a factory of their own, which is greatly enlarged, and have equipped it throughout with special tools and machinery adapted for the particular work which they have to do; but even in their new quarters, they say, they are compelled to run overtime in order to keep up with the demand made upon them for machines. Boiler cleaning is one of the most difficult jobs the engineer has to perform. It is a source of continual worry to him, as well as a matter of anxiety to the superintendent, as tubes in bad condition not only cut down the power, but add to the fuel bills. In addition to tube cleaners, this company is making feed water and damper regulators and will be pleased to correspond with any interested in anything along these lines.

Obituary.

F. H. BEURICH, for the past seven years superintendent of the Evening Star mine in Old Diggins district, near Redding, Shasta county, Cal., died on the 2d inst. of heart failure. Deceased was a native of Germany, 58 years of age.

D. P. BYSTLE, a pioneer mining man of Shasta county, Cal., died at Redding, Cal., on the 7th inst. Deceased was born in Pennsylvania, September, 1821, coming to California in 1850, and engaged in mining on the Feather river. He is survived by three daughters and two sons.

E. TILLEY, a pioneer mining man of Nevada county, Cal., died at Nevada City,

Cal., June 5. Deceased was a native of England, aged sixty-four years. When eighteen years of age he came to the United States and worked in the copper mines at Lake Superior, Mich., rising to the position of "captain," or superintendent of the mine. Later, going to California, he became superintendent of the Forest Springs mine near Nevada City, then of the North Banner mine, and, still later, superintendent of the Murchie and of the Peabody mines. He is survived by a widow.

C. E. PURRINGTON, a well-known California mine manager, and superintendent of the Fremont consolidated mines near Amador City, Cal., was instantly killed on June 6 by the explosion of the air compressor. The machine had been working unsatisfactorily and Mr. Purrington was endeavoring to fix it when the accident occurred. His foreman, Wales Palmer, was also seriously injured by the explosion. Mr. Purrington had been in charge of the Gover mine several years previous to the consolidation of the property, in which he took an active and important part. He was highly esteemed by those who knew him, and his loss will be keenly felt in Amador county. He leaves a wife and family.

New Patents.

DEWEY, STRONO & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JUNE 2, 1903.

- 730,674.—BICYCLE PUMP—W. A. Allen, Colgate Place, Wash.
- 730,075.—SAFETY SNAP—C. P. Allison, Lodi, Cal.
- 729,992.—LOADING ORB—J. Baker, Jr., S. F.
- 729,718.—CLEANING SAND FILTER BEDS—H. W. Blaisdel, Yuma, Ariz.
- 729,719.—CLEANING SAND FILTER BEDS—H. W. Blaisdel, Yuma, Ariz.
- 729,720.—CLEANING SAND FILTER BEDS—H. W. Blaisdel, Yuma, Ariz.
- 729,721.—CLEANING SAND FILTER BEDS—H. W. Blaisdel, Yuma, Ariz.
- 729,722.—CLEANING SAND FILTER BEDS—H. W. Blaisdel, Yuma, Ariz.
- 730,036.—SAND DRIER—H. W. Bohrmann, Los Angeles, Cal.
- 729,534.—COUPLING—M. P. Boss, S. F.
- 729,734.—SACK SEWING MACHINE—J. L. Boyle, Harrisburg, Or.
- 729,726.—JAR CLOSURE—Annie E. Bray, Los Gatos, Cal.
- 729,728.—PIPE WRENCH—F. D. Bullard, Los Angeles, Cal.
- 729,731.—GLOVE—F. H. Bushy, S. F.
- 729,545.—BARREL TAP—M. J. Chaplin, Seattle, Wash.
- 729,741.—VISE—G. W. Drew, S. F.
- 729,743.—UNDER REAMER—M. H. Dunn, Fullerton, Cal.
- 729,553.—SPEAKING TUBE MOUTHPIECE—Finck & Eberstitt, S. F.
- 729,576.—MOTOR VEHICLE—J. D. Harp, Modesto, Cal.
- 729,931.—ICE VEHICLE—I. N. Hennessy, Ilwaco, Wash.
- 729,870.—PUMP—B. Jackson, S. F.
- 729,139.—RAILWAY SPIKE—J. W. Macauley, San Jose, Cal.
- 729,662.—TUB ATTACHING DEVICE—G. H. Marker, Spokane, Wash.
- 730,141.—PICTURE FRAME HANGER—F. A. Matthews, Eureka, Ca.
- 729,631.—MIRROR RECEPTACLE—J. A. Miller, S. F.
- 729,883.—GRAIN SCREEN—Mood & Lyman, Colfax, Wash.
- 729,890.—HAMMER—G. W. Peek, Greenview, Cal.
- 729,723.—SOUND RECORDER—E. J. Romano, Seattle, Wash.
- 729,903.—BALING PRESS—G. Senger, S. F.
- 730,172.—CHURN—M. F. Still, Lapanza, Cal.
- 730,183.—WINDOW CLEANER—F. W. Wille, Oakland, Cal.
- 730,064.—TROLLING SPOON—A. W. Wilson, S. F.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SERIES HIGH PRESSURE CENTRIFUGAL PUMPS FOR HIGH HEADS.—No. 729,870. June 2, 1903. Byron Jackson, San Francisco, Cal. This invention relates to improvements in series high-pressure centrifugal pumps for raising and forcing water by increasing pressure in successive steps, using the centrifugal impactive and cumulative forces set up by two or more rotating runners mounted upon the same shaft; and it consists of an improved adjustable automatic balance for end thrust on shafting and of casing sections inclosing suitably curved waterways between the discharge of one runner and the entrance of the next in the series. There are details of construction which provide a simple, practical and operative machine.

BALING PRESS.—No. 729,903. June 2, 1903. G. Senger, San Francisco, Cal. This invention relates to improvements in horizontal presses of the continuous type. Its object is to provide a press of maximum capacity in which there need be no cessation of operations, either for feeding, tying or discharging, in which the operating mechanism for the followers is simple, and in which the same power driving the followers may be utilized to co-operate in propelling the carriage upon which the press may be mounted.

MOUTHPIECES FOR SPEAKING TUBES.—No. 729,853. June 2, 1903. Julius Finck and H. Herstritt, San Francisco, Cal. Assigned to Will & Finck Co. of San Francisco, Cal. a corporation. This invention relates to improvements in call annunciators in which both a visible and audible signal is given. Its object is to provide a device in which a semaphore will be operated, a whistle blown and an electric bell rung by the action in the tube, of the breath of the person giving the call and in which device wind and drafts will be prevented from passing through the tube to operate the signals accidentally, as so frequently happens in factories and large buildings to cause annoyance in answering false alarms.

MINING AND SCIENTIFIC PRESS

Mining in British Columbia.

British Columbia is notedly a mining region. Its hills are rugged, and many of its mountain ranges are high, and on the whole, the transportation problem, where it has not been simplified by railways, is one which is a serious drawback to the more rapid development of the region. The report of the Minister of Mines for that Province, Hon. E. G. Prior, for the year 1902, states that the progress for that year has been less marked than usual, and states further that if the statistics of production alone be relied upon, it would appear that no advance whatever had

silver, copper, lead and coal showed a falling off of 4% to 58%.

The Province has great fertility of resource, however, and large districts are said to remain still unprospected. With better prices for silver, copper and lead, the present year should show a material improvement in those metals; but the coal mines are still greatly affected by strikes and other troubles. Gold mining in the Province seems to have a steadily increasing growth, and in this commodity, at least, there is no depreciation in the value of the metal produced. In the gold mining industry of the Province placer, hydraulic and quartz mines are operating,

ing of gold-copper ores and \$655,321 from amalgamation and concentration of siliceous ores, the concentrates being smelted. The total amount of silver produced in 1902 was 3,917,917 ounces, valued at \$1,941,328. The total copper production reached 29,636,057 pounds, of which somewhat more than one-half was produced by the Boundary district, and over 11,000,000 pounds by Rossland district.

A small amount of platinum was derived from placer washings, and tin is reported discovered in metallic form in rock in a mine in Cariboo district. This reported occurrence of metallic tin is so unusual that the report should be taken with much allowance,

McClelland Mountain, and Colorado Central Dumps, Near Argentine, Colo. (See Page 396.)

been made, as the gross value of the output is really less than that for the previous year, though this is the first time that this has occurred since the beginning of mining in the Province.

This falling off in value of output is due to a number of causes. British Columbia is a large producer of base metal, copper and lead, and also produces a large amount of silver while producing also a large amount of gold. The fluctuations of the market have undoubtedly affected the output of the base metals, and in the coal mines, the rapid introduction of petroleum as fuel in California, which was the principal market for the coal mined in the Province, has made a notable reduction in output. Labor troubles also contributed in no small degree to keep that industry from expanding as had been anticipated.

The output of placer gold increased about 10%, and that of vein gold showed an increase of 12.4%, but

and dredging is also in progress. On the whole, the progress and development of the gold lode mining industry are most promising, for, as the Minister of Mines truthfully says, the product of lode gold mining in British Columbia has shown the steadiest and most regular increase, and this product is the most valuable which the Province has, and gold is the only product not affected by changes and uncertainties of the market. Gold mining, aside from the various forms of placers, can scarcely be considered as a separate industry in the Province, however, as the gold is usually found associated with other metals, such as copper or silver. A certain percentage is derived from stamp milling, but is mostly from smelting of sulphide ores. The gold production of the Province in 1902 is stated to have been \$4,888,269—an increase over the previous year of \$539,666. Of this amount \$4,232,948 were derived from the smelt-

though it may be found upon investigation to be as stated. Dana cites an instance of a reported find of metallic tin near the headwaters of Clarence river, near Ohan, New South Wales, where it is said to occur in small, grayish-white rounded veins, with platinum, iridosmine, gold, cassiterite and corundum, all likely to occur in granitic dikes, and not, therefore, a surprising association of minerals, excepting as to the native tin, which is most unusual.

In addition to the metal and coal mine output of British Columbia, there are quarries and deposits producing structural materials, including granite, bricks, lime, cement, tiling and drain pipe, fireclay, etc., but the amount of the output is not stated by the Minister of Mines. There are in British Columbia a large number of mining districts widely scattered; but there are mines scattered throughout the entire Province, which are described in the report.

Record Shaft Sinking.

The figures given in a communication appearing elsewhere herein, relative to the progress of shaft sinking in the shafts of the Nigel Deep mine, on the Rand in South Africa, are worthy of attention, as illustrating what has been accomplished in that remarkable country. When shafts are put down at the rate of 3 to 5 feet per day in the United States, the accomplishment is viewed with satisfaction, but when the result of the work of November last in sinking the shaft of the Wolhuter mine was announced—209 feet in a single month—it out-reached by considerable the most speedy shaft sinking in hard rock, in this country and on the Rand as well, but the statement that 260 feet were sunk in a vertical shaft, and a similar amount in an inclined shaft on the Nigel Deep in July, 1898, and the further statement that had not a defective hoisting machine retarded work, a record of 300 feet would have been possible, is remarkable, and the more so in consideration of the large amount of ground being broken elsewhere in the mine and hoisted through the same shaft. While the "unfavorable conditions" mentioned might have had an influence on the work that was and may have been accomplished, the handicap was probably confined to the afore-mentioned hoist and all other conditions, as to hardness and character of ground, freedom from troublesome water, etc., must have been of the most favorable sort.

THE Navy Department has concluded a long series of exhaustive tests on crude California petroleum as fuel for naval vessels. It is stated that as a result of these tests, which have been conducted on vessels on the Potomac river, that petroleum is superior to coal, and will be introduced on coast defense and torpedo boats, but on the larger vessels coal will still be used.

The Miner and the Law.

In the case of J. J. O'Leary vs. J. Ross, Judge Stewart of the District court, in Washington county, Idaho, has rendered a decision in favor of the defendant. The disputed point involved the validity of defendant's location, because of non-agreement between the monuments as set on the ground and the description of the claim boundaries as given in the recorded location certificate. Subsequent to the Ross location, O'Leary staked a claim guided by the recorded boundaries of the prior location, but overlapping it as staked on the ground. It is a recognized rule in law that, where there is a variation between the "metes and bounds," as recorded, and the monuments in place, the monuments control. The average miner and prospector is not presumed to be an expert surveyor, so mistakes as to directions and distances may naturally be expected to occur, which fact the law recognizes, hence the decision.

The United States statutes is the fundamental basis upon which the prospector and miner relies in locating his mineral claim. The statutes are less complete and clear in some of their details than may be desired. This is evidenced in the conflicting opinions of recognized legal authorities, and in the numerous suits at law over questions which should be perfectly plain. The various mining States of the West have added to rather than detracted from the perplexities which beset the prospector by wholesale (and sometimes unnecessary) mining legislation. Certain laws, or parts of laws, proving obnoxious, have from time to time been repealed, or amended, thus complicating a situation already bad, until the miner scarcely knows what his rights really are or what the law expects of him. No State or local laws supplementing the United States statutes are really necessary; but where such do exist a location may be perfected by following the requirements of the Federal law and also those of the local law. A State or local mining district may not make laws in conflict with the Federal statutes, but they may impose additional conditions, and in some States this is actually done.

While, in a general way, the locator would be safe in following exactly the requirements of the United States law, in some States failure to comply with the local or State law might result in forfeiture of a claim. For this reason the prospector should be familiar with all the mining laws—Federal, State and local—in the district in which he is working.

In the single matter of marking boundaries, as an instance, there is considerable diversity as to requirements in the several States. In this matter the element of time is an important consideration. In some States the law is made perfectly plain, and no misunderstanding should occur; while in others the "letter of the law" does not make it wholly clear what time may elapse between the "discovery" and "marking the boundaries." Yet in no case is a location perfected until the boundaries are indicated by suitable monuments.

The Arizona law requires that within ninety days of the date of discovery the locator shall establish his boundaries by "setting six substantial posts, projecting at least 4 feet above the surface of the ground, or by substantial stone monuments at least 3 feet high, to wit, one at each corner of said claim and one at the center of each end line thereof."

In California there is no definite requirement and the Federal statute must be relied upon. Under the United States law a claim may be marked at any time prior to the acquisition of an intervening right, regardless of whether the time within which such marking was made was reasonable or not. It has been held in California that while a party in actual possession, proceeding with diligence to mark his boundaries, would be protected as against a stranger attempting to relocate, yet strictly speaking, no time is allowed the locator to complete his location by marking it on the surface. As it is a physical impossibility for a locator unaided to erect the several monuments, or posts which define the boundaries of his claim at the same moment, he must have some time in which to perform this necessary act, and in consideration of this common sense idea the Circuit Court of Appeals for the ninth circuit, in one of the California cases (Newbill vs. Thurston, 65 Cal.), de-

clined to accept this doctrine of the California courts (Doe vs. Waterloo M. Co., Fed. 70), but followed the rule announced by the Supreme Courts of Idaho and Nevada, and the very evident intent of the law as suggested by the Supreme Court of the United States, and the courts of last resort in Colorado, South Dakota, Washington and Montana. The Court of Appeals has held that after a discovery and posting a notice thereof the locator had a reasonable time in which to complete his location; what was a reasonable time would be determined by the facts in each case, and that evidence of customs in other localities might be received for the purpose of determination, and that under the circumstances in that particular case that twenty days was a reasonable time.

The State laws of Colorado do not define the time within which a location may be perfected, which leaves the locator to rely upon the Federal law. Nevada, North Dakota, South Dakota, Utah, Wyoming and Washington are similarly situated in this regard.

In Idaho the State law provides that within ten days from the date of making a discovery the locator must mark his boundaries "by establishing at each corner thereof, and at any angle in the side lines, a monument marked with the name of the claim and the angle it represents."

The Montana law requires that within thirty days of discovery the locator shall mark his boundaries, and Oregon gives a similar length of time.

In view of this perplexing situation, it is to the interest of the locator that he shall perfect his location as speedily as possible, but in many cases the strike and extent of the ore deposit or vein are obscure and can only be determined by actual development, and on the whole the courts are inclined to deal leniently with the locator who fails to hastily erect monuments defining his claim. In the event of a rich discovery a locator should fix his stakes as quickly as practicable, but if the error is made in laying out the claim across the lode instead of along its course, whereby the vein crosses the side lines, he loses his extralateral right, and this every miner desires to secure.

Ventilation in Mines.

One of the most important matters for the consideration of a mine manager is the ventilation of the workings. It is true some mines are far superior to others in this regard, due to many causes. A mine having large shafts or tunnels, with roomy drifts, etc., is naturally better ventilated than where the workings are small. A mine heavily timbered generates more foul air (CO₂) than one where little or no timber is employed, particularly where the air is humid. There are many ways in which mine air becomes contaminated. The breathing of the workers; the burning of lights (other than electric); the oxidation (rotting) of timbers; all consume oxygen and produce carbon dioxide. Beside these noxious gases, floating dust, smoke and other foreign bodies in the atmosphere help to contaminate the air the miner must breathe. An abnormally high temperature is also prejudicial to the health of the miner, particularly when there is much moisture present.

Mines which are naturally ventilated, by reason of connection with the surface at several points, as in a mine opened by a tunnel which is connected with the surface with a raise, or workings connected with the surface by two or more shafts. Artificial ventilation is provided by means of fans, blowers, water blasts, etc., and where large volumes of compressed air are employed this also assists ventilation, though in the case of the latter the air is sometimes vitiated by lubricating oil and is often rendered unfit for breathing, by reason of the oil being heated to high temperature in the cylinders of the compressor and adjacent pipes. So hot does the air become at times that the highly heated oil has been known to ignite spontaneously, creating a volume of smoke and carbonic acid gas which is forced into the mine workings. There are many different methods of ventilating mines, and where the ventilation is not naturally good it should be rendered as good as possible by mechanical means. It is not economy to fail to provide good air for miners to breathe, for in order to accomplish a satisfactory shift work, the air must be free from foul gas and other contaminating substances.

CONCENTRATES.

A BELT traveling 3500 feet per minute will require a tension of but 9½ pounds for each inch in width in order to transmit 1 H. P., and one having a width of $100 \div 9.5 = 10.5$ inches, will transmit 100 H. P.

A DUPLEX double-acting mine pump, plungers 10 inches diameter, stroke 24 inches, forty revolutions per minute, would discharge 555 gallons per minute.

THE mineral specimens from Fernwood, Idaho, are a variety of garnet, with small scales of copper carbonate (malachite). Garnet is of frequent occurrence with copper ore, particularly when in or near limestone.

COMMON iron castings may be coppered by dipping the absolutely clean castings into a solution of 1½ pound copper sulphate in water to which one ounce sulphuric acid has been added, the articles so coppered being subsequently washed and dried.

QUARTZITES in some of the old crystalline rocks are sometimes mineral-bearing; particularly do they often contain iron and copper ores. The jasper often found accompanying quartzites is due to the metamorphism of such fine grained rocks as slate.

FROM 60 to 70 cubic feet free air per minute are required to operate a 2½-inch drill, sixty pounds gauge pressure, at sea level, atmospheric pressure being 14.7 pounds per square inch. At 3000 feet altitude atmospheric pressure is 13.16 pounds per square inch, requiring proportionate increase.

THE mineral sample from Riddle, Oregon, is magnetite (magnetic iron oxide). The rock accompanying it is not serpentine, but seems to be a basic dike rock which is partly altered to serpentine. The green scales and stains are copper carbonate. The fibrous olive green mineral is crysolite—a variety of serpentine.

CAST IRON articles such as car wheels, for instance, are made by casting the article in an iron mould instead of a sand mould. The depth of "chill" depends to some extent upon the size of the casting, the chill on a small casting being relatively deeper than in a large one. Unless very small, the inner portion is not chilled by the process.

A STRIP of single belting, 1 inch wide and 13 feet long, weighs, approximately, one pound, and a similar strip of double belting, 8 feet long, also weighs a pound; so that the weight of a belt may be estimated by multiplying the width in inches by length in feet, and dividing the product by 13 for single and 8 for double belts; the quotient will be the weight in pounds.

ALUMINUM, because of possessing the property of forming under whetting action a very fine mass to which steel strongly adheres, is being used for manufacture of whetstones. A steel blade sharpened on aluminum, when examined by microscope at 1000 diameters, shows the cutting edge perfectly uniform and unbroken—not serrated, as steel whetted on stone.

QUICKSILVER, or mercury, occurs in the native state in veins and deposits containing the ores of this metal. The most common ore of quicksilver is cinnabar (HgS), mercury sulphide. The occurrence of native mercury in an ore deposit of cinnabar is looked upon with distrust by some miners, who consider it an indication that the bottom of the deposit is not far distant.

THE Colorado "bumping table" is run at varying speed and length of vibration, depending upon the character of ore treated. It is usually run at 160 bumps per minute with 1½-inch stroke. Often it is run at 150 bumps, with 1½-inch stroke, and sometimes at 180 bumps with 1-inch stroke. The more rapid the bumps the shorter the length of stroke, and vice versa.

WHENEVER electricity is used in connection with cyaniding there is a larger expenditure of chemicals, and the base metals are dissolved to a much greater extent along with the gold and silver, which for later separation involves increased expense. However, when electric current is employed, a weaker cyanide solution may be employed, as its action is increased by the current.

APLITE is a fine-grained granite dike rock, usually composed of quartz, orthoclase and some plagioclase, generally without mica, or with a very small amount of silver-white mica or greenish potash mica. Often the rock is very siliceous, the silica evidently being the result of infiltration, and when in this condition is occasionally gold bearing. Often it graduates into felsite on one hand and into normal granite on the other.

THE practice of placing a shut-off valve on the main line leading from an air compressor to the receiver, usually situated outside the building, is one which should be discontinued, though, fortunately, not in general use. A valve so located may have its sphere of usefulness, but it is difficult to discover just what it is. It is doubtful if a

valve placed in the position indicated would pay for its cost and installation. A valve beyond the receiver is recommended, and it can often be employed to advantage.

A WATER WHEEL may be given increase of speed from that which the water imparts to it, by means of a motor, and may thus give increased power, but the full amount of power so transmitted by the wheel will not equal the normal amount afforded by the motor and the water. The amount of power so available from the wheel will be but slightly in advance of that derivable by the wheel from either the motor or the water separately.

THE SULMAN-TEED process, which is that of treating ores by a solution of bromo-cyanide, is based on the chemical reaction

It is claimed that the superiority of this process over the ordinary cyanide process lies in the fact that the addition of bromine to the solution renders the dissolving power of the cyanide more effective and rapid. It is claimed also that the addition of peroxide of barium to cyanide solutions greatly accelerates the action of the cyanide.

CONCERNING mining claims in the forest reserves, the proclamations themselves provide specially for preserving the status of mining claims which are valid and subsisting at the date of the withdrawing of the land from that portion of the public domain subject to appropriation. It is not, and never has been, the policy or intention of the Government to antagonize the mineral industry in the withdrawal of the forest-bearing lands from settlement, but to protect the forests from destructive fires and other waste, that it might be used in mining and other legitimate industries.

In steam pumps five ports are employed—two for admitting steam only, two for exhausting steam only, and the fifth, or central port, the same as in the engine. It is necessary to cushion the piston in direct-acting pumps, so that when high speeds are reached the piston at one end and the plungers at the opposite end will not strike the cylinder heads. The cushioning effect is secured by providing a separate exhaust port, so located that when the piston has nearly completed the stroke it will close the exhaust port and entrap a portion of the exhaust steam. This steam is confined between the piston and the cylinder head, and being prevented from escaping through the steam port by the valve, it is compressed, and thus stops the piston before it reaches the cylinder head.

STADIA HAIRS can be placed in instruments which are without them. This should be done by instrument makers who have every facility for this class of work. Fixed hairs are usually more satisfactory than those susceptible to adjustment, as there is less danger of the lines becoming disarranged. The hairs are generally placed at such a distance from each other as to cover exactly 1 foot on the stadia rod, when the latter is set exactly 100 feet from the focal distance of the instrument. Each foot read on the stadia rod indicates a distance of 100 feet, to which must be added the constant distance from the center of the instrument to the focal point in front of the object glass, this distance being usually 10 to 14 inches, depending on the size of the instrument.

THE origin of a mountain range cannot well be given in a "Concentrate." Briefly, the earth was once incandescent, is still very hot within and cooling very slowly. Where sediments accumulate on a sea bottom the interior heat rises, the thicker the sediment the higher the degree there of interior heat. This temperature in the presence of the included water of the sediments ultimately produces softening or fusion of the sediments and of the sea floor on which they rest. This establishes a line of weakness, and, hence, a line of yielding, crushing, bulging, folding—a mountain range, which means a subsidence and a pushing and folding upward. Of course in all this, a million of what we call "years," is but a tick of Nature's clock. Nature knows nothing of "Time," past or present. It has but one eternal "Now."

TOURMALINE CRYSTALS of good size and perfect form are a much sought for article among mineral collectors. California has produced some beautiful tourmaline crystals. The very finest specimens are secured in Eastern localities—Connecticut, Maine and Virginia. Tourmaline comes in colors—black, blue black, brown, yellow green and gray. A fine red tourmaline is such a rarity that it commands an enormous price, as much as \$500 having been paid for a single specimen. Such a specimen must be perfectly transparent and free from flaws. The prismatic faces of tourmalines are strongly striated, vertically, and the crystals are hence often much rounded and barrel-shaped. The mineral is strongly dichroic—that is, exhibits different colors when viewed in a different direction. It becomes electric by friction, usually found in coarse-grained granite dikes.

A GOOD method of testing the strength of cyanide solutions is by means of titration with nitrate of silver solution. This method is based on the fact that silver cyanide is soluble in an excess of potassium cyanide, with the formation of a double cyanide of silver and potas-

sium. At a certain point, however, in the addition of the silver nitrate, the silver cyanide ceases to be dissolved and falls as a whitish precipitate. The amount of silver nitrate (of standard solution) required to cause an incipient precipitation to take place, measured on a burette, determines the percentage of cyanide present in the solution. A standard solution may be made by dissolving 13.06 grains of pure silver nitrate (AgNO₃) in one liter of distilled water. The addition of each 0.1 c.c. of this solution to 10 c.c. of cyanide solution to be tested represents 0.01% of pure cyanide of potassium in the solution.

THE process of recovering gold from cyanide solutions by passing the solutions through a charcoal filter was invented and patented by Dr. W. D. Johnstone in 1894. The process is not in use except experimentally. Charcoal was previously employed in recovering gold from chlorure solutions containing it. This process was employed at the large chlorination works at the Mount Morgan mine, Queensland, Australia, and is still in use there. When a large amount of gold has been deposited on the charcoal filter, the coal is removed, dried and incinerated in a furnace constructed for the purpose. In the use of charcoal in the cyanide process, it is said that particles of the coal in extremely fine state of division pass the filter, and reaching the sump tanks are pumped back to the solution tanks and ultimately into the percolation vats, where it causes precipitation of the dissolved gold.

THE ROCK SAMPLES sent from Yale, B. C., are quartzite containing scales of graphite, constituting what may be termed a graphitic schist. Neither pyrite nor chalcocopyrite are observed in the several samples, though the brown stains are undoubtedly due to iron oxide. This may be due to the oxidation of a small amount of iron sulphide, which may occur in finely disseminated grains. The iridescence noticed on some of the pieces of rock may be due to copper, but it is probable copper will be found to occur, if at all, in very small amount. The rock may be gold bearing, as such rock sometimes is, but there would probably be found some difficulty in amalgamating such ore. Concentration, however, would probably give a better result. Graphite is sometimes separated from gangue in which it occurs by concentration. In some instances the rock is finely pulverized in water, the graphite floating being recovered from the surface of the waters.

THE Federal statutes provide that failure to perform \$100 worth of work, or to make \$100 worth of improvements during any one year following the first January after date of location, renders such mine or claim subject to relocation by another, no matter what amount of work may have been previously performed or improvements made. A new discovery is not an essential basis for a new location. Under the law discovery and appropriation are recognized as the sources of title to mining claims, and development by working as the condition of continued ownership until patent is obtained. If the vein discovered by a former locator extends through the claim and is elsewhere exposed, this is sufficient upon which to base a new location. A relocation is made in substantially the same manner as the original. A relocater may adopt the stakes and monuments of the former locator if he so desires. The laws of California do not require any particular form of location notice, and a witness to the location or relocation of a mining claim, though admittedly of value to the locator, is entirely unnecessary. Moreover, in the absence of State legislation or local law, the Federal laws do not even require a location notice to be posted.

ASSAYS made from the cuttings of diamond drill bits are necessarily only approximately indicative of the values through which the drill passes. When in operation the diamond drill cuts an annular space in the rock, the central portion being known as the core. As the drill advances, the fine material resulting from the scratching of the diamonds sets in the bit, is driven backward by water which is introduced under pressure, the cuttings flowing out of the drill hole, where, if desirable, they are allowed to fall into a receptacle of some sort. Ordinarily this is a bucket, and the cuttings flow for some time into the bucket, often overflowing and the slimes passing out with the water would destroy the value of the sample, if it were a sample, but unfortunately it is not. The particles of rock, sulphides of the base metals, gold or whatever substance may be contained in the rock through which the drill passes, pass backward through the bore hole. Often along the bore hole the surface is rough, particularly in schistose or slaty rocks, and any particles of high specific gravity will settle in the depressions for a time, though eventually reaching the outer end of the bore. When samples are taken by means of the bucket only general knowledge can be gained. The cores, however, furnish absolutely reliable data upon which to base calculations, but it must be understood that only a series of bore holes, systematically placed, will give a definite idea of the size of an ore body or vein. That the cuttings do not fairly represent the ground through which the drill is passing is shown by the fact that when a zone of rock containing abundant sulphide mineral is cut by a diamond drill, and this is succeeded by a zone containing no sulphide, the sulphide previously out continues to be discharged from the bore for some time after the barren zone has been entered, accompanying the cuttings from the latter zone.

Notes in the Parral District, Chihuahua, Mexico.

Written for the MINING AND MINING PRESS by H. Z. OSBORNE,
Los Angeles, Cal.

Parral, or Hidalgo de Parral, is a busy little city of between 15,000 and 20,000 inhabitants, in the southern end of the State of Chihuahua, and the center of one of the most productive mining sections of the republic of Mexico which the writer visited last winter. The city is essentially Mexican in its architectural character and citizenship, and in the entire district there are probably less than 1000 foreigners, of whom the Americans are the most numerous. Parral is built immediately about some of the oldest mines—the hill on which they are situated, called Cerro de la Cruz, or Hill of the Cross, being partly in the city (see illustration). In fact, it was these mines that first brought the village into existence 300 years ago, and some of them have been worked with occasional interruptions until the present day. The Jesus Maria is one of these, and it is

of low freight and smelter charges, that their own works were generally closed, and nearly all the ore was being shipped to the big smelters. Another element in these low smelter charges was undoubtedly the operations of the "independent" smelters, particularly that at Torreon. So great has been the competition between the "trust" smelters—those of the American Smelting & Refining Co. and the Guggenheims—and the independent smelters, that, whereas a few years ago the freight and smelter charges on ore shipped from Parral was \$20 per ton gold, it is now \$12 per ton Mexican, or less than \$5 per ton gold. This brings into market not only the ore that is produced from day to day, but also an enormous quantity of second-grade ore which has been accumulating on the dumps for a century or more, and which could never before be handled at a profit. The shipping output of the Parral mines is now from 40,000 to 50,000 tons per month, and it would be greater if the Mexican Central Railway could furnish the ore cars with which to remove it.

The principal productive mines of the Veta Colorado are at the southern end of the lode, which extends nearly north and south for a distance of 7 or 8

siderable water. It produces from 1000 to 2000 tons per month.

La Alfarena is down about the same depth as La Presena, and the levels between the two mines are connected. Both are owned by the Hidalgo Mining Co., a Pittsburg, Pa., corporation, which operates more and larger mines in the Parral district than any other company. James I. Long, who is also the American Consul, and his brother, Robert J. Long, are the managers of the Hidalgo Mining Co., which also owns and operates the Parral & Durango Railroad.

The Quehradillas adjoins the Veta Grande on the north, and has a shaft 850 feet deep. While this mine has been operated intermittently for a century, its greatest production has been during the past six years, in which a profit of more than \$1,500,000 Mexican has been realized.

Los Muertos is next north of the Quehradillas, and is down 725 feet. It has a fine ore body and produces 2500 tons per month.

The Terrenates is north of Los Muertos, has a shaft 460 feet deep, and is reported to have recently developed a rich ore body.

La Veta Colorado, Minas Nuevas, Near Parral, Mexico.

Bridge at Parral, Mexico, 300 Years Old.

Morena Mine at Minas Nuevas, Mexico.

credited with a production of \$7,500,000 in silver, with a little gold. The vein is said to average 16 feet in width, and to have been worked to a depth of 250 feet. The Prieta is the most conspicuous mine on the hill, and while it has been worked a great length of time it has attained a depth of but 377 feet.

The most productive mines of the Parral district, however, are not immediately in town. The Veta Colorado, or Red Vein, is north of Parral, and extends in a northerly direction several miles. This is one of the great veins of the world, although it lacks the remarkable length of the mother lode of California, or that of the reefs of the Witwatersrand of South Africa. In fact, the known mines are confined to a length of 3 or 4 miles on the vein, but they are continuous, one after another. The red color of the vein, which is in porphyry, can be seen for a long distance, stretching along the west side of the summit of a range of hills from 500 to 800 feet high. The product of the mines is almost exclusively silver, with a little galena, in quartz. The large percentage of silver in the ores, associated as it is with some lime and iron, makes them particularly desirable for fluxing the baser silver-lead ores of other Mexican districts. To such an extent is this the fact, that, notwithstanding several companies have large reduction works at their mines, the big smelters were offering such inducements to the miners in the way

miles. The best mines cover a length of 2½ miles on the lode, and embrace, from south going north, La Esperanza, La Morena, El Nopal, El Salto, La Presena, Alfarena, El Verde, Veta Grande, Quehradillas, Los Muertos and Terrenates. The lode is owned for miles north of the Terrenates, but less work has been done in these mines, and less values produced. The vein is very wide at the surface, from 50 to 300 feet, but the vein is by no means all ore. The ore occurs in successive shoots, from 100 to 200 feet long and from 1 foot to 60 feet wide, generally largest near the center of the shoot, and the shoots are usually several hundred feet in depth. In La Presena a large lens of ore, carrying 120 ounces silver, was found 40 feet outside the hanging wall of the vein proper, between the 400-level and the surface.

The oldest mine on the lode is the Veta Grande, discovered in 1645, and worked almost continuously ever since. The Veta Grande and El Verde have always been worked as one property, and were recently purchased by the Guggenheims. The main shaft is down 1000 feet on the incline of 52°. All the shafts on the lode are inclines, and all are sunk at about the same angle.

La Morena is 900 feet deep, with no water, and with a fine body of ore, from 10 to 15 feet wide, on the lower level.

La Presena is down 927 feet and is pumping con-

Enough has been said to show the importance of the great Veta Colorado. Parral has many mines, however, and some of them very valuable, that are not on the Veta Colorado. El Refugio is one of these. This mine is at Minas Nuevas, on two veins parallel to the Veta Colorado, but 600 feet west of it. The shaft is down 700 feet. The principal vein is nearly vertical. It was from 1 to 5 feet wide in the upper levels, and from 15 to 20 feet wide in the lower levels of from 70 to 100 ounces silver ore. Extensive reduction works have been constructed on the property, for treatment of ores by the lixiviation process. Nearby, the Hidalgo Mining Co. have two large mills, employing the same process.

Much has been printed about the Palmilla mine, or rather about its owner, Pedro Alvarado, the "peon millionaire," as he is called. Alvarado, who has become very wealthy the past few years from the output of the Palmilla, is credited with having made an offer to President Diaz to pay the Mexican national debt. While Alvarado has made a large amount of money, it is doubtful whether he ever made the offer credited to him, and it is certain that he could not have "made good," if such an offer had been accepted. Neither was Alvarado really a peon. The Palmilla mine was owned by his father before him, but had never been an excessively rich property, although it is one of the historical mines of the Par-

ra's district. Pedro was working it in a limited way in 1900, and encountered a fabulously rich ore body, from which he has taken a handsome fortune. There are no reduction works on the mine, and all the ore is shipped to the smelters. Gold predominates in the product, although there is some silver. Pedro Alvarado, with his sudden wealth, has developed a

Cathedral on the Plaza, Parral, Mexico.

large vein of benevolence, though it usually takes a rather eccentric course. He is constructing a palace on the site of his birthplace, in one of the most squalid parts of the city of Parral. It is all of stone, which admits of most elaborate carving, which is all being done by native workmen. He has also restored a large Catholic church that was going into decay, at a cost of \$80,000. Alvarado is good to the poor, and is said to provide for all the heggars in Parral. The Palmilla mine produces much rich specimen ore, and Mexican miners, like those of some other nationalities, are given to stealing stuff of that sort that

Street Scene, Parral, Mexico; Cerro de la Cruz in Background.

seems to be in their way. Alvarado, however, will not permit any precautions to be taken to prevent thieving, upon the theory, probably, that "it is wrong to muzzle the ox that treads the corn." Altogether, Pedro Alvarado is an interesting character, and many stories are told of his eccentric benevolence. He is also said to have an amiable side toward Americans. His mine has been and still is a large producer of high-grade ore, but bonanza ore is less plentiful than it was a year or two ago.

The San Juanico, owned by the Long brothers, is another rich gold mine with an ancient history. This mine is about 4 or 5 miles northerly from Parral, and a mile east of the Palmilla. It was worked by the "ancients" down to the water level, about 200 feet, and great values are said to have been taken from it. It remained idle for more than half a century, when

the Long brothers purchased it, and equipped it with modern machinery, including a powerful pump and hoist. There are four parallel veins, all within a width of less than 100 feet, varying in width from 3 to 15 feet. The ore is high grade, averaging 2 ounces gold and from 20 to 50 ounces silver per ton. Since my visit to the San Juanico, I am informed that the vein was crosscut at a depth of 300 feet, and 7 feet in width of bonanza ore was found, that would average several hundred dollars per ton.

There are scores of mines at Parral and in its neighborhood well worthy of mention, and several reduction works. The Parral Milling Co. has two mills, one employing the lixiviation process and one concentrating. F. Stallforth Hermanos y Cia have a large patio reduction works.

Santa Barbara, about 12 miles southwest of Parral, is another very productive district, although its ores are not of high grade. This place was, more than three centuries ago, the capital of the Province of Nueva Viscaya, which included the present States and Territories of Chihuahua, Sonora, Coahuila, Texas, New Mexico, Arizona and California. The first mineral discovered in northern Mexico was the gold ore of this place, in the year 1547. The branch of the Mexican Central Railroad, which leaves the main line at Jimenez and passes through Parral, is extended to Santa Barbara. The Guggenheim Exploration Co. operate the celebrated Tecolotes mine at Santa Barbara, and have a concentrating mill of 400 tons daily capacity. The Montezuma Lead Co.'s concentrating mill is of 375 tons capacity. The San Francisco del Oro and the Parral Mine, Ltd., also have reduction works at Santa Barbara.

A company, of which Thomas Lane, of California, is the head, has concessions for and has in operation electric light and telephone systems in Parral, Minas Nuevas and Santa Barbara, and has a concession for a water system.

The Hidalgo Mining Co. have built a narrow-gauge railroad—the Parral y Durango—out from Parral about 80 kilometers into a fine body of timber, of which they own about 200,000 acres. This road passes through Minas Nuevas, and several smaller mining camps, and an interesting agricultural country. It furnishes Parral and its various power plants with fuel and lumber, and is a profitable piece of property. It is on this road that one starts out for the long mulehack trip to the Guadalupe y Calvo country, in southwestern Chihuahua.

Record Shaft Sinking.

TO THE EDITOR:—In your issue of March 14, 1903, referring to an article entitled "Deep Mining on the Rand," I note the following reference to maximum speed in shaft sinking on the Witwatersrand field: "Should a shaft be started this year to reach the reef at the bottom of the borehole in the Cinderella, allowing no loss of time in preparatory work, and sinking at the maximum speed thus far made on the Rand (Wolhuter 209 feet in the month of November, 1902). * *

I wish to point out that this is an entirely erroneous statement in so far as maximum speed is concerned.

During the month of July, 1898, at the Nigel Deep G. M. Co.'s property, Witwatersrand, a footage of 260 feet was made in what is termed D shaft, this under adverse circumstances, for had not the spur wheel of the hauling engine broken, thus delaying the work considerably, it would have been possible to have accomplished no less than 300 feet during the month.

This sinking was accomplished in an incline shaft 14 feet by 7 feet in the clear, which was being extended from the bottom of the vertical shaft 800 feet in depth. The incline shaft was extended from the 1127-foot level to the 1387-foot level.

In addition to handling the ground broken in the shaft no less than five levels were at the same time being extended from the incline, in each of which an average footage of 100 feet per month was being accomplished, making a total of ten drive faces, in addition to the numerous winzes and rises which were being extended. I refer to these latter faces because the breaking of the ground is really a secondary consideration with the labor and appliances at hand on the Witwatersrand fields, the important consideration in rapid work being the handling of the broken ground.

In driving at the same mine an average monthly footage of 183 feet (over a period of seven months) was accomplished in a single drive, i. e. (7 feet by 5 feet). As far as I know both of these footages are records which have not yet been approached, either on the Witwatersrand field or in this country.

I would be glad if you would publish the above letter, for if nothing more is accomplished it will at least show what can and has been done in the matter of shaft sinking and driving.

At the time this work was being carried out E. H. Garthwaite was the general manager of the property and the writer was the underground superintendent. F. C. ROBERTS, Consulting Engineer.

The regular meeting of the Montana Society of Engineers was held in Butte, Mont., on Saturday, the 13th inst.

Electrolytic Reduction of Baryta.

The recent purchase of lands in Washington county, Mo., from which considerable baryta has been mined in the past, and the inauguration of active mining operations in that field by the United Barium Co. of New York City, has attracted considerable attention to the baryta producing possibilities of Missouri, says the St. Louis, Mo., Lead and Zinc News. In 1901 the total production of baryta in Missouri was slightly in excess of 32,000 tons, of which quantity Washington county produced some 21,000 tons. The total production of baryta in the United States during 1901 was 49,070 tons, from which it will be seen that Washington county, Mo., alone produced 45% of the total output.

The advent of a competitor to the American Lead & Baryta Co. and the baryta combine effected last year makes information regarding the latest addition to the baryta market interesting. The United Barium Co. was formed to acquire the work and the process of working barium sulphate into other barium salts which was developed to commercial working by the Ampere Electro-Chemical Co. The officers of the company are: G. S. Ettla, president; W. H. Miller, vice-president; J. G. Petrekin, treasurer, and T. L. Wells, works superintendent.

The principle employed is that of melting in an electric furnace a mixture of barium sulphate with a small quantity of carbon, usually only $\frac{1}{10}$ of its weight. If sufficient carbon is present all the sulphate is reduced in the electric furnace to sulphide, according to the reaction

Requiring one part of carbon to five parts of sulphate and reproducing the ordinary furnace reaction for making the sulphide. If barium sulphate and barium sulphide are fused together at the heat of an electric furnace, however, they will react according to the formula

But this reaction cannot be produced at ordinary furnace heats. If, therefore, just one-fourth as much carbon is used as is necessary to reduce the sulphate to sulphide the one-fourth of the sulphate reduced to sulphide reacts upon the unchanged three-fourths and the oxide is obtained. The sum total of the two reactions written altogether is

The reaction is not perfect, however, and in general only about two-thirds of the sulphate is converted into oxide. Nearly one-third remains as sulphide and only a very small fraction remains unchanged, some 1% to 3%.

There are two furnaces now in operation working this process. They are of the direct heating arch type, the carbons being adjustable and playing an arch on to the fused material. The body of the furnace is lined with carbon blocks and the contents are tapped out from time to time, as the furnace gets full of melted material. The carbons are raised and lowered by means of small electric motors, controlled by the workmen, and passed through a square opening in a grid of wrought iron pipes, cooled by a stream of water and covered with a non-conducting cover. The workmen can thus feed in material while standing close to the furnace, but the mixture of barium sulphate and carbon must be fed in slowly, because the gases evolved by the reaction are large in volume and would cause violent boiling if melted too quickly. Attempts are being made to recover the sulphur dioxide evolved so as to convert it into sulphuric acid. Each ton of sulphate furnace gives off enough of this gas to make one-half a ton of 50% sulphuric acid.

The plant is being enlarged so as to manufacture sixty tons of barium hydrate $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$, per day. The present output is stated to be twelve tons daily. There are three 400 H. P. furnaces, each taking 2500 amperes at 120 volts, and at this output, allowing that only 60% of the sulphate is reduced to oxide, the efficiency of the furnaces would count up 74%, absorbed in heating up the melting mixture and in the chemical reaction, while 26% would be lost by radiation.

The furnace product is tapped out, running into cakes about 3 feet by 4 feet and 3 inches thick. This is broken up and digested with hot water, leaving very little insoluble sulphate, but the material is about 60% barium oxide and 40% barium sulphide, which go into a solution as 60 parts hydrated oxide, 20 parts sulphide and 20 parts sulphhydrate. On cooling the filtrate the hydrate, $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$, crystallizes out. When dried and packed it sells at 3 cents per pound. The mother liquors are treated to recover their barium as carbonate and also to recover the sulphur in them by methods which are yet not quite worked out.

The raw material, barite, from Missouri, costs \$2.50 per ton where found, but the railway freight raises its cost to some \$6 per ton at Niagara. It is about 90% pure. To obtain cheap material the company have acquired a remarkable deposit of barite on the north shore of Lake Superior, near Silver Islet. The cliff here is 50 feet high, and a vein of

pure white barite 77 feet wide, with perpendicular strike, is exposed for the whole height of the cliff, and is visible 30 feet down in the water, while it has been traced on shore a distance of 600 feet back from the water. At a moderate calculation 250,000 tons of barite are in sight, which can be shipped from the spot to the company's wharf at Niagara more cheaply than Lake Superior iron ore can be carried to Pittsburgh.

The use of the company's products are various. Barium hydrate finds application in the paint trade in making white paint; in the sugar trade for recovering sugar (as insoluble barium saccharate); from waste dilute solutions and for softening boiler waters. The mother liquors from the crystallization of hydrate, containing barium sulphide and sulphhydrate, have been found useful in removing hair from hide, a solution diluted to 2½% removing all the hair from a hide in three and one-half hours' immersion without any injury to the leather. The same solution is very suitable for making the white paint called lithopone, which is made by running a solution of zinc sulphate into barium sulphide solution, thus producing the precipitated pigment, a mixture of barium sulphate and zinc sulphide. The mother liquors can also be converted into barium carbonate, which has found application in the cyanide industry and also in the manufacture of bricks, for mixed in small proportion with clay it is said to prevent red brick from turning white and white brick from turning green.

Geological Work in Cripple Creek District of Colorado.

In the early history of Cripple Creek the United States Geological Survey made an exhaustive survey of the Cripple Creek, Colo., mining district, and published the same in the sixteenth annual report. That work proved to be of great assistance to the mine operators of the district, but as the workings at that time were comparatively superficial the extensive and deeper operations of recent years made a re-survey of the district advisable, but as the United States Survey was unable to undertake and complete such a survey with the funds available for the purpose, various mining companies and mine owners have contributed the sum necessary to meet the deficiency and the work of the re-survey will be commenced in a short time. Cripple Creek will be represented by J. W. Finch, State Geologist of Colorado. The terms and conditions under which the work is to be conducted is in the form of an agreement and is as follows:

1. The specific work to be undertaken under this agreement is the re-survey of the Cripple Creek mining district, an area of not less than the 38 miles represented on the Cripple Creek special sheet accompanying the Pike's Peak folio No. 7, Geologic Atlas of the United States.

2. The work shall consist in a thorough re-examination of the surface and underground geology as exhibited by natural and artificial surface exposures, mines, drainage tunnels, etc.; a study of the ore deposits as to their distribution, extent, origin and geologic associations; and the preparation of a report accompanied by maps and other illustrations showing the results of this re-examination in detail, to be published by the United Geological Survey without cost to the State.

3. The work shall be in charge of W. Lindgren, geologist, under the direction of the director of the United States Geological Survey through the geologist in charge of economic geology. Mr. Lindgren shall have the selection and entire control of his assistants.

4. During the progress of the work Mr. Lindgren will be intrusted to confer freely with J. W. Finch, State Geologist, and keep him informed of the manner in which the work is being done and of the progress being made. No information of an economic character shall be given out by the State Geologist, Mr. Lindgren, or his assistants, in advance of publication by the survey.

5. For the expense of the work the United States Geological Survey has allotted the sum of \$3500, and the State Geologist of Colorado has allotted an equal amount from funds under his control, the same being now on deposit and subject to his order. During the progress of the work duplicate vouchers will be made out by Mr. Lindgren for all expenses, including salaries of himself and assistants, traveling expenses and field subsistence. These vouchers will be transmitted to the accounting division of the United States Geological Survey, and after approval vouchers covering one-half of the expenditure will be transmitted to the State Geologist of Colorado for payment. A statement of all expenditures for this work will be made monthly by the accounting officers of the United States Geological Survey to the State Geologist.

6. The resulting maps and reports shall fully recognize the State co-operation.

(Signed) J. W. FINCH, State Geologist.
C. D. WALCOTT, Director U. S. Geological Survey

INADVERTENTLY the name of H. S. Johnson, the writer of the illustrated article entitled "Chain and Pick Coal-Cutting Machinery," which appeared in the issue of June 5, was omitted from the same.

An Important Colorado Enterprise.

The Transcontinental Transportation & Mining Co., recently organized in Denver, Colo., with a capital of \$3,000,000, promises to be one of the great enterprises of Colorado. This company owns eighty-three mineral claims, 160 acres of placer, three millsites adjoining each other and three tunnel sites, connected, making a total of over 550 acres. The property is situated about 7½ miles above Georgetown, Clear Creek county, in the Argentine mining district. It is the object of the company to drive a tunnel through the Continental Divide. Argentine pass, said to be the highest wagon road in the United States (13,000 feet) winds its way over the property

side of the Divide. The engraving of McClelland mountain (see front page) will give one an idea of the topography of the mountains in the Argentine district, as well as Leavenworth gulch, and the Colorado Central mine, which has produced \$10,000,000 and is still a good producer. The Transcontinental T. & M. Co. also own timber lands and controls the source of Clear creek for a distance of 6000 feet, and has already constructed a good-sized dam, which will furnish all the necessary power for the machinery which will be installed the coming summer. English and German capital is interested in the enterprise, which will mean much to Georgetown and the district generally.

The company is a Colorado corporation, with W. A. L. Cooper as president, R. C. Vidler vice-president

Vidler Tunnel, East Argentine, Colorado.

Interior Vidler Tunnel, East Argentine, Colorado.

of the company, and it is under this pass the company purpose driving a tunnel. The tunnel which has already been started, and now in 350 feet, is known as the Vidler tunnel, and when completed will have a length of 7000 feet, and will cut the entire mineral belt of the district and will enable the company to work its entire system through one main channel. Besides using the tunnel in mining operations it is the intention of the company to use it for railroad purposes, as it will have a size of 16x16 feet, thus enabling the railroad company to complete its line from Georgetown, in Clear Creek county, to Keystone in Summit county, on the other side of the range. This, it is believed, will be valuable, as it will make a shorter route from Denver to Leadville and Salt Lake City. One of the accompanying illustrations is that of the tunnel entrance, and the other the underground workings of the tunnel on the Clear Creek county

and general manager, G. H. McCauliffe secretary, W. A. Deuel and L. F. Kimball directors, and J. F. Brandes, mining engineer of Denver, who has made a study of Clear Creek county mines, is the consulting engineer for the company.

Tin in Texas.

In Bulletin 213 of the United States Geological Survey, W. H. Weed describes the tin deposits at El Paso, which lie on the east flank of the Franklin mountains, about 10 miles north of El Paso. The ores consist of cassiterite, or oxide of tin, with wolframite (tungstate of iron and manganese), in a gangue of quartz. Three veins have been discovered, all of which have been exposed by open-cut work and by pits, for a distance of several hundred feet. The

veins of good ore exhibit the usual characteristics of the European tin veins.

The development seems to show the disappearance of the ore at a depth greater than 50 feet, but it is believed that the veins may be found lower down by crosscutting from the bottom of the present workings.

The Armstrong Tool Holders.

Points of merit claimed for the Armstrong tool holders, manufactured by Armstrong Bros. Tool Co., of 617 Austin Ave., Chicago, Ill., are that tempering is dispensed with; grinding reduced to a minimum; points may be ground to any desired shape or clearance, they are of handy length, and the point always keeps the same height; simple and durable; the rake

Gold Ores of Ontario, Canada.*

NUMBER II—CONCLUDED.

Written by CHARLES BRENT, M. E.

As may be gathered from the foregoing notes, the gold ores of the district may be regarded as free milling, and experience has shown that 70% to 90% of the total gold contents of the ores may be obtained by simple battery amalgamation, and a satisfactory percentage of the remaining values may be obtained by subsequent concentration and chlorination or cyaniding, or by direct cyaniding without previous concentration.

The free milling character of the ore has been retained in depth, and from the considerations pre-

veins in Eagle Lake, is invariably associated with the sulphides of zinc and lead, although these minerals in most cases carry little or no gold per se.

The rare sulphide of bismuth (bismuthinite) is abundant in the ore from the Mikado vein and is sparingly found in other veins of the vicinity. It is invariably associated with high gold values in the Mikado vein, and possesses no significance in any other veins in which it occurs.

Mispickel and other arsenical and antimonial sulphides are rare, and traces only of telluride are met with, the only exception being the Huronian vein in Moss township, which produced very fine specimens of sylvanite, and in the Gold Creek vein on Lake of the Woods, which in a narrow pay shoot carries the rare silver telluride hessite.

Leaves of native copper are comparatively common in the gold ores of the district and particles of native silver and of native platinum have been found associated with gold in several veins on the Lake of the Woods. Molybdenite is commonly found in gold-bearing veins, but possesses no significance as an indicative mineral.

As indicative minerals the sulphides range in value as follows: Zinc blende 1, galena 2, copper pyrites 3, iron pyrites 4.

The Triggs, Reliance, Gold Panner, Virginia, Cameron Island are among many others worked on bedded veins in schistose formations with more or less success.

So-called true fissure veins are numerous in the granite areas, but, as might be expected, are comparatively rare in schist. The Ferguson, Foley and Lucky Coon on the Seine river, the Golden Eagle on Eagle lake, and the Nino in the Deer lake country, may be cited as notable examples of this class of deposit in granite, and the pebble vein at the Gold Hill mine and the jubilee vein on the Manitou may be cited as examples of true fissures in schistose formations.

Of contact veins, no typical examples have been worked, although many such are known. The Mikado vein and the Black Eagle each cross a contact between diabase and granite, and since by longitudinal faulting in each case one wall of the vein is granite and the other diabase for a short distance, these veins are in part true contact deposits.

It may be noted as a curious feature that the richest ore in the Mikado vein lies in the zone of contact, while the leanest ore in the Black Eagle lies in the corresponding position.

As to the primary source of the gold in these deposits, not enough data are at hand to enable one to generalize with any degree of certainty, but from the fact that many of the felsite dykes carry gold per se, and that no gold has been found in Couchiching series and but rarely in the sedimentary members of the Keewatin, and that eruptive contacts have been proven to be favorable to the presence of gold, it would seem that the gold came up from deep-seated sources both with Huronian eruptions and the later Laurentian granites, to be distributed in its present situations with the quartz and accompanying minerals by the circulation of water under unknown conditions as to time, temperature and pressure.

As to the character of the ore, it may be noted that in all classes of deposits the gold, whenever found in workable amounts, is invariably associated with quartz in some form, and with the sulphides of iron, copper, lead and zinc, and that no complex minerals, and but few rare minerals are present.

Gold, if present in workable amounts, is to a great extent, "free milling" and it may be taken as an axiom in this district that if any ore does not show gold in the pan it is economically valueless.

As to associated minerals, it may be noted that iron pyrites occurs in every gold ore in the district, and that as an indicative mineral, it is valueless.

The same is true of pyrrhotite, which is commonly abundant in the pyritous schists. When an ore contains "free" gold the iron pyrite invariably contains gold, the pyrrhotite almost never.

Copper pyrites in the ores of the Black Jack, Wendigo, Mikado and Black Eagle is invariably associated with high values in gold, while in the ores of most of the other veins of the district its presence means nothing favorable or otherwise.

True fahl bands or belts of schist impregnated with pyrite and other sulphides are unknown in the district, but numerous bands of pyritous schist with intercalated seams of quartz are to be found in the country. These generally contain lenticular bodies and stringers of quartz and are rather to be regarded as bedded deposits, although generally claimed as fahl bands. Among this class may be cited the Scramble, near Rat Portage, the Flint Lake on Flint lake and the Little Bobs on Denmark lake. Bedded or lenticular or segregated veins are the usual form of ore deposits in schistose rocks, and these occur in great variety in Western Ontario.

At the Sultana, a series in sheared porphyritic gneiss have produced a large amount of gold. At the El Dorado on Eagle lake a bedded deposit in sheared granite is being developed with satisfactory results. At the Big Master, a bedded vein in chloritic schist has produced a large amount of gold. The Gold Hill veins, the Black Jack and Golden Gate veins in Hornblende schist have been worked with satisfactory returns.

The Olive, in the Seine River district, lying in a

of the cutter is such that it takes a clean curling chip from wrought iron or steel—no top grinding being necessary. The accompanying cuts illustrate several of the cutting devices and holders made by this company. Figs. 1 and 2 show a straight shank tool holder in position for lathe and planer work, so arranged as to give an idea of their adaptability to work in close corners. Figs. 3, 4, 5, 6 and 7 give illustrations of the various uses of offset tools. Figs. 8, 9, 10 and 11 show the boring tool and its method of operation. In Figs. 12, 13 and 14 are illustrated the Armstrong planing tool. Fig. 12 shows the tool at work in close corners, giving a general idea of clearance obtained. It shows also a few of the angles at which the cutter can be set. A job similar to one above could be finished with the Armstrong planer tool without shifting position of the work on bed.

Fig. 13 shows the planer tool cutting a keyway with the cutter reversed and the tool turned around, thus throwing the cutting point behind center of tool and practically working as a "goose-neck" tool.

sented in these notes it is expected that these characteristics will be permanent to any depth, and, since from a geological standpoint there is no reason why the deposits themselves may not run to as great depths as are practicable to mine, it would seem that, in spite of many disastrous failures up to date, as soon as the era of "wildcatting" and stock jobbing passes over money and common sense will ultimately make a profitable, permanent mining industry in Western Ontario.

Galena is invariably associated with high values in gold in the Sultana, Mikado, Golden Horn, Golden Star, Olive, Foley, Champion, Treasure and Big Master mines.

Zinc blende is of the highest value as an indicative mineral in the veins of this district, and wherever quartz is found with disseminated zinc blende it is safe to say it is rich in gold. The richest ore in the Foley, Golden Star, Sultana, Champion, Golden Horn, Sakoose and Big Master, as well as in the

*Trans. Can. Min. Inst.

Armstrong Tool Holders.

bed of schistose diorite, is also auriferous and has produced a good deal of gold.

The Golden Horn, on the Lake of the Woods, in chloritic schist, is being actively developed with satisfactory results. The Wendigo, on the Lake of the Woods, is working a bedded vein in a band of pyritous hornblende schist which carries a workable amount of gold.

A number of interesting occurrences may be cited to show the widespread diffusion of the precious metal in this district and the varying character of the auriferous deposits.

On Gold brook, near the Mattawan river, a number of locations have been taken up on a band of fine-grained gneiss, with sparsely disseminated grains of iron pyrites, which carries gold throughout from a trace to 50 cents per ton. This deposit is nearly $\frac{1}{2}$ mile wide and several miles long, and although the gold content is too low for profitable working, the occurrence must be regarded as highly interesting from a theoretical standpoint.

At the Hammond Reef, a band of shattered granite with quartz-filled seams has been found to carry a workable amount of gold over a width of 300 feet and a length of some miles.

On Shebandowan lake a number of very coarsely crystalline dikes of porphyry carry from a trace to \$20 per ton.

On Eagle lake a band of schistose granite 30 feet in width is being worked with satisfactory results.

A large number of locations have been taken up on felsite dikes, many of which carry gold per se as well as in the fissures now filled with quartz, which were produced by the shrinkage of the dike rock in cooling or by subsequent movements along the line of weakness which caused the primary dike fissure. Among these may be mentioned the Bully Boy on Camp bay; the Champion, near Rat Portage; No. 2 vein at the Big Master on the Manitou, and the Sakoosie in the New Klondike, all of which have been proved to contain workable amounts of gold.

A Montana Gold Mine.

The Garnet gold mine, near Pony, Madison county, Mont., is driving a new tunnel started on the hillside back of their mill. A new power plant is to be in-

realgar (As_2S_3) and orpiment (As_2S_3), and at Nagy Ag, in Transylvania, Hungary, it is found in metallic condition. Arsenical ores occur widespread in the United States, especially in the West.

Previous to 1899 the supply of arsenic and its compounds was derived almost entirely from the mines in Cornwall and Devon, England, and near Freiberg, Germany; but the closing of the Devon Great Consols mine, near Tavistock, in 1901, called for an increase or new supply from other localities.

In 1900 Canada contributed a small quantity, which has since been largely increased; and in 1901 the United States became a producer on a small scale, and more than quadrupled its output in 1902.

Although arsenical pyrites (mispickel $FeS_2 + FeAs_2$) has been reported in many localities in Ontario, the entire production of arsenic in Canada during 1901 and 1902 was obtained from the arsenical gold ores of the Deloro mine in Hastings county, which is owned and operated by the Canadian Gold Fields, Ltd., a London corporation.

In addition to the gold, which assays from 8 to 15 pennyweights per ton, the ore consists essentially of quartz impregnated with arsenical pyrites and occasionally with copper pyrites, frequently accompanied by a large proportion of iron pyrites. The ore is crushed and amalgamated, yielding directly from 57% to 60% of the original gold value in the ore. The pulp is then concentrated, the concentrates carrying practically the balance of the gold and the arsenic, and the tailings containing less than 2% of the gold in the ore and but 0.5% of arsenic. The concentrates are treated by the Sulman-Teed bromo-cyanide process, and from 87% to 92% of the gold content is extracted, the total recovery of the gold amounting to approximately 90% of the original gold value in the ore. The concentrates contain approximately 30% of arsenious oxide and 16% of sulphur, and to extract the arsenic they are dried and roasted in a revolving cylindrical furnace, the condensed fumes therefrom forming a crude product of 85% arsenious oxide and from 2% to 4% of sulphur. The crude arsenious oxide (called crude arsenic) is refined by sublimation in a reverberatory furnace, and the hot gases therefrom containing the volatile arsenious oxide have the impurities settled out by passage through a number of heated flues. Finally the fumes are delivered to a large brick chamber where the refined arsenious

Regeneration of Cyanide Solutions.

TO THE EDITOR:—I have just had my attention drawn to an article in your issue of May 30, on the "Regeneration of Cyanide Solutions After Zinc Precipitation," by Andrew Crosse, and read by him before the Chemical Society of South Africa.

Five years ago I devised a method for regenerating sodium or potassium cyanide from the double cyanide of zinc and sodium or potassium, and two years ago I took out a patent in this country (patent No. 689,017), which was an improvement on the method which I had first employed. This process of regeneration is at present in use in several plants in the West. At the Chloride Point mill, Utah, when my process for regeneration was first installed there, the plant ran for over a month without the addition of any fresh cyanide, using instead the cyanide regenerated from the double cyanide of zinc and potassium held up in solution. I found that to obtain good precipitation at the ordinary temperature with sodium sulphide, the double cyanide of zinc and potassium had first to be dissociated by the addition of a certain amount of alkali, when 60% to 75% of the zinc contents (depending on the quantity of the zinc present and also the amount of free cyanide present) could be precipitated without leaving free sulphide in solution, but to obtain complete precipitation of the zinc heating of the solution had to be resorted to.

Heating of the solution to obtain this object is not practicable, as it is neither necessary nor desirable to entirely remove the double cyanide of zinc and potassium from solution, and a clean active solution can be kept by the occasional precipitation of the zinc as mentioned above; besides, heating the solution to a point sufficient to throw down all the zinc produces a reaction between the sulphide and cyanide, forming sulphocyanide, a compound which is much more harmful in the solution than considerable double cyanide of zinc and potassium.

Another very beneficial result of the removal of the

Garnet Camp and Mill, Pony, Montana.

Entrance Garnet Tunnel, Pony, Montana.

stalled and the tunnel driven by means of electric drills. It crosscuts the formation and is expected to reach the vein developed in the upper workings in about 1300 feet. The accompanying illustrations show the camp and mill of the Garnet Company and also the entrance to the new tunnel. E. L. Ballou is superintendent.

The Production of Arsenic.*

Written by JOSEPH STRUTHERS.

The production of arsenious oxide (white arsenic) in the United States during 1902 was 1355 short tons, as compared with 300 short tons in 1901. The entire product was made by the Puget Sound Reduction Co. at Everett, Wash., which began the manufacture of this important substance in 1901. The largely increased output in 1902 is a very favorable sign of the success of the new industry.

Arsenic occurs widely distributed in nature, but only in a few localities in sufficient quantity to be of commercial value. The most frequent combination is with iron and sulphur, forming the mineral arsenopyrite (mispickel). With sulphur alone it occurs as

oxide is collected, ground to 100-mesh size, and automatically packed in wooden kegs, each holding 500 pounds. The marketable product contains from 99.6% to 100% of arsenious oxide, the remaining impurity consisting of silica in a finely divided condition.

By far the greater part of the arsenious acid manufactured at Deloro during the last four years has been shipped to New York to supply the demand in the United States. Practically the entire supply derived from Canada and the United States is consumed in this country. The domestic production, however, even though aided by imports from Canada, was not sufficient to supply the demand for 1902, and there were imported from Canada, England, Germany and Spain during the year 1,385,700 pounds of arsenious oxide, valued at \$42,424, and 6,725,198 pounds of arsenic sulphide and orpiment, valued at \$237,631.

The production of white arsenic in Canada was 52 metric tons in 1899, 275 tons in 1900, 630 tons in 1901 and 726 tons in 1902.

The chief use for arsenious oxide is in the manufacture of Paris green, although it is used to a minor extent to make Scheele's green, London purple, lead arsenate, sodium arsenate, potassium arsenate and other arsenic salts.

zinc by the sulphide in this process is that during the precipitation the zinc carries down, sympathetically I think, other salts (such as antimony, arsenic and considerable lime as sulphate) which are detrimental to the solution.

After several years experience with this process I have never found the alkali increase in solution, as one would expect from the equation, possibly because in every case the ore on which the solution was used had an acid reaction.

Regeneration of the H_2S from the ZnS_2 , as suggested by Mr. Crosse, has not been used here, as it was found more economical to use Na_2S (solid, containing 66% Na_2S), which costs from 2 cents to 3 cents per pound delivered at the plants in 500-pound drums.

The cost of regeneration of the sodium cyanide from the double cyanide of zinc and sodium by my method is from 3 cents to 5 cents per pound of sodium cyanide regenerated, depending on the amount regenerated and the cost of chemicals at the different plants.

My object in drawing your attention to this article is to show that the method suggested by Mr. Crosse, to be used by the cyanide operators in South Africa, has been in use in this country for some years.

Denver, Colo., June 14.

WILLIAM ORR,

* Extract United States Mineral Resources.

Mining and Metallurgical Patents.

PATENTS ISSUED JUNE 9, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR EXTRACTING METALS FROM ORES.—No. 729,805; J. Stoveken, Cripple Creek, and L. Stoveken, Florence, Colo.

In apparatus extracting precious metals from ores, means whereby ore reduced to finely divided or comminuted state in presence of solvent, series of overflow tanks arranged receive mixed ore and solvent from reduction means; tanks containing means for agitating ore and solvent, and filter arranged to receive mixed ore and solvent from last of overflow tanks, adapted separate solution from ore.

SEPARATOR.—No. 730,229; J. T. Burr, Glenville, Ohio.

Separator for separating mass of matter into component portions composed of particles approximately equal in specific gravity, consisting of longitudinal hollow body, having base formed of series of upwardly inclined planes inclined at angles slightly exceeding critical angles of material and presenting extended frictional surfaces in planes intercepting at small angles line of movement of material under force of current, separated at ends from one another to form escape outlets between adjacent planes, inlet for mass of material adjacent to lowermost inclined plane, and means to induce current of fluid upward through hollow body over inclined planes.

CRUSHER AND PULVERIZER.—No. 730,503; M. J. Williams, St. Louis, Mo.

In crushing and pulverizing machine, combination with casing, of disintegrating means therein including plurality of pivoted beaters and operating means

therefor, each beater comprising shank, head formed with socket to receive end of shank and oppositely disposed pockets opening into socket, and means in pockets for securing head to shank and regulating weight of head without changing position of head on shank.

HYDRAULIC CLASSIFIER OR SIZER.—No. 729,764; J. F. Isbell, Denver, Colo.

Hydraulic classifier or sizer, combination of upright casing having funnel-shaped top, valve chamber below funnel, reduced part below valve chamber, enlarged part below reduced part, and another reduced portion below enlargement, tube located in casing filling reduced portions, passing through enlargement, and protruding into valve chamber, valve chamber extremity being outwardly flared or funnel shaped, tube being open where it passes through enlargement to allow water to enter, opposite extremity protruding from casing, supply conduit connected with casing enlargement, valve located in valve chamber adjacent lower extremity of funnel, lower portion valve being surrounded by upper extremity of tube, valve being provided with stem passing downwardly through tube large enough allow water flow upward freely around valve stem from casing enlargement, valve stem fitting tube below casing enlargement and protruding below same, tube and valve being adjustable vertically in casing.

SMELTING FURNACE.—No. 730,610; E. Campbell, Rossland, Canada.

Combination in receiver for use in connection with smelting furnaces, of inner and outer plates spaced apart forming water jacket and provided with opening for tapping jacket, inner plate being provided with outwardly projecting wing surrounding opening and at outer edge with flange underlying outer plate, rivets securing such flange and outer plate together, tapping jacket fitting in opening in side of receiver, and composed inner cup-shape section having central opening, and outer section having outer plate provided with edge flange threaded into outer end of cup section and provided with inwardly tapering central tube threaded in central opening in cup-shape section, and means for securing tapping jacket in connection with body of receiver.

AMMONIA-CYANIDE PROCESS OF TREATING COPPER, NICKEL OR ZINC ORES CONTAINING PRECIOUS METALS.—No. 730,836; D. Mosher, San Francisco, Cal.

Process of treating refractory sulphur, tellurium and arsenical ores containing copper, zinc, nickel,

gold and silver, consisting in roasting ores at low red heat to transform metals into sulphates, arsenates or tellurates; oxidizing reducing compounds by dilute ammonia, and subsequently extracting metals with ammoniacal cyanide solution containing excess of cupric oxide or hydroxide over and above that necessary to form metallic cyanide double salts.

APPARATUS FOR REMOVING DRILL TOOLS FROM WELLS.—No. 730,460; F. G. Irvine and J. B. Braden, Salem, W. Va.

In apparatus for removing drilling tools from wells, combination with casing adapted for endwise reciprocal movement, of grab to be lowered into casing, having means for interlocking grab with casing and also with drill tool to provide for simultaneously reciprocating latter with casing to loosen tool and to draw it out of well by manipulation of casing.

BLAST FURNACE CHARGING APPARATUS.—No. 730,799; E. G. Rust, Pueblo, Colo.

Apparatus for charging stock to blast furnace, etc., combination of two sets of tracks one above another leading to charging opening of furnace, each set of tracks having independent discharge device, with cars constructed to operate upon tracks.

APPARATUS FOR THE PRECIPITATION OF METALS FROM SOLUTIONS.—No. 730,385; P. W. McCaffrey, Denver, Colo.

Apparatus for precipitation of dissolved metallic values, combination of tank adapted to hold solution to be treated, perforated receptacle containing scrap metal, perforated walls of receptacle being composed entirely of same material, receptacle partially immersed in solution and mounted to rotate therein, whereby solution is made to circulate through scrap metal.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence.)—The Ebner G. M. Co. at Juneau are grading for a 100-stamp mill, thirty of which they will put in this season. They have fifteen stamps in the old mill, which are in operation.

At the Sheep Creek mine, near Juneau, O. R. Meyer, who has a bond on the property, is preparing for further development work and additional equipment. There is a 30-stamp mill at the mine, twenty stamps of which are dropping.—F. Brock of Douglas City, part owner in the Bessie G. M. Co., operating near Juneau, says a 10-stamp mill will be built this summer, some machinery for which is on the ground.

The Rodman Bay G. M. Co., operating at Rodman Bay, 90 miles from Juneau, are building a 100-stamp mill, says G. E. Bent, manager.

Juneau, June 12.

The Alaska-Perseverance tunnel, near Juneau, is in 1200 feet and the crew has been increased to twenty-one men. Two machine drills are in operation.—The Northern Homestake M. Co. has been incorporated at Phoenix, Ariz., with C. E. Lovett of Duluth, Minn., J. Wagner and A. S. Lovett of Juneau, to operate a group adjoining the Alaska-Atlin property on the south, and is said to be on the same lode as the Ready Bullion mine on Douglas Island.

ARIZONA.

COCHISE COUNTY.

At the Commonwealth mine, near Pearce, they will sink below water level. They are pumping out of the mine 10,000,000 gallons of water, and have pumps capable of handling 4,000,000 gallons of water per day.

At Tombstone they have been pumping from the Consolidated mine 2,300,000 gallons of water per day. The result of the pumping operations shows they have drained for a depth of 30 feet below the permanent water level, says the Bisbee Review. The company is adding more boilers to its plant.

The May output of the Calumet & Arizona mine, near Bisbee, amounted to 2,130,000 pounds of copper. The equipment for the third furnace is on the ground.

The Longhunt mine at Tombstone is to be reopened.

The Calumet & Western D. & M. Co. of Calumet, Mich., has been organized under Arizona laws, with F. S. Carlton, J. Bosch, W. B. Anderson and J. Daniel as officers.

W. N. Edwards, I. Diamond and G. Monroe have bought the Eureka group of claims, 3 miles from Bisbee. There are eleven claims in the group. Development work will begin next week.

Superintendent J. Reay of the Atlas Exploration & M. Co. at Clenega Springs, near Douglas, says he has put men at work sinking a shaft on the Indiana claim, which has a showing of copper.

GILA COUNTY.

T. Crandall of Phoenix, superintendent of the Confederate M. Co. group in the Tonto Basin district, north of Globe, says he will put in an electric drill and a hoist.

GRAHAM COUNTY.

The Sierra del Oro G. M. & M. Co. has begun development work on their group of claims in the Greenlee district, near the Frisco river, 5 miles north of Clifton. The mines will be opened up by tunnels, and the ore conveyed to the milling plant on the river by tramways. F. P. Elredge, of Chicago, Ill., is president and B. M. Crawford, of Clifton, director and manager.

MOHAVE COUNTY.

It is reported a 10-stamp mill will be built at the Clay Springs group of mines in Musio Mountain district, near Kingman. There is a supply of water at Clay Springs, which will be brought in to be used in the mill. The mines show bodies of free milling gold ore.

The Mohave G. M. Co. will build 23 miles of narrow-gauge road connecting the mine and mill and then to the bank of the Colorado river, opposite Needles, Cal. The road may be carried to the Gold Road mine, says the Mohave Miner.

PIMA COUNTY.

The Producer M. Co., in Quijotoa district, reports work progressing in building their smelter at Brownell. There are 100 men at work.

The Banner M. Co. will build a 100-ton concentrating plant on its group in the Sierra mountains, near Tucson. The veins carry copper, lead and silver.

YAVAPAI COUNTY.

(Special Correspondence.)—Superintendent J. Farrell of the McCabe mine of the Model G. M. Co., at McCabe, in Chaparral district, is retimbering the parts of the shaft damaged when the mill was burned. He started rebuilding the mill this week, which will have a capacity of 100 tons daily.

McCabe, June 16.

In the mill at the Octave mine at Octave forty stamps are dropping on the ore, which is afterward treated by the cyanide process, and 4000 tons per month are handled. There are 14 miles of piping necessary to bring water to the property on the gravity system, and oil is used for fuel. J. R. Leonard is manager and A. E. Hurley superintendent.

Manager B. Blanchard of the Iron King mines in Bradshaw mountains, southeast of Prescott, reports an electric plant will be put in.

CALIFORNIA.

ALPINE COUNTY.

The Curtz-Evans mill at Loope started up last week. They have a 2-mile tramway leading to the mine, a complete electric light system and abundant water power.

AMADOR COUNTY.

(Special Correspondence.)—It is reported the Lincoln mine is about to start extensive exploration work with a diamond drill. The mine is developed to a depth of 2000 feet, the principal work having been done west of the shaft.

Sutter Creek, June 17.

CALAVERAS COUNTY.

W. Lanigan, assistant manager of the Royal mine at Hodson, says the 120-stamp mill will be ready for operation by August 1.

The 14-inch pump at the Forty-nine gravel mine at Douglas Flat is expected to be in operation this week, says J. Evans, superintendent.

The Utica Co., at Angels, expect to close down the Utica shaft on July 1st, and future operations will be conducted through the Cross shaft.—Work at the Sultana mine is progressing and the shaft is down 700 feet. Arrangements are being made for putting in machinery. The 10 stamp mill is running steadily.

The new system of treating the sulphurets at the Melones mine, at Melones, was put in operation last week, says the Angels Record. It is the "barrel" system, consisting of a steel barrel 16 feet long and 30 inches in diameter, being swung on a shaft and made to revolve at rapid rate; barrel has number of steel balls inside, grinding the sulphurets, which are fed in at one end, into a fine powder; powder comes out at the other end of the barrel, where it is run into the precipitation tanks for treatment. Two electric motors, one 20 H. P. and a 30 H. P. are used.

The Chicago and Pennsylvania men, who have bought the Stockton Hill placer mining properties, consisting of the Stockton Hill, Clover Leaf and Hexter mines, near Mokelumne Hill, have men at work. Machinery is being put in to equip the first-named mine, consisting of an 80 H. P. boiler, two 25 H. P. engines, a pump with capacity of 12,000 gallons per hour, 3 stamp mill, with a capacity of 75 tons in 24 hours, rock breaker, etc. Crude oil, which can be delivered at the mine for \$2 per barrel, will be used for fuel. The Clover Leaf and Hexter will also be provided with machinery later on. It is expected to have the plant in operation by October 1st. The two principal operators are K. H. Seibel, of Chicago, Ill., and H. Yeager, of Forty Fort, Penn.

EL DORADO COUNTY.

(Special Correspondence.)—P. Morgan and G. Levaggi are about to reopen the Mount Pleasant mine, near Grizzly Flat, and expect to make extensive improvements and developments. The Mount Pleasant vein is a strong ledge 3 to 14 feet wide cropping along the surface for several thousand feet. It has produced over \$3,000,000 from a single ore shoot in the vicinity of the shaft sunk near the mill. In addition to this shaft, which is over 800 feet deep, there are several other shafts of lesser depth, with extensive development of levels. The formation of the country is granite and the Mount Pleasant vein is one of a system of veins. Grizzly Flat, June 16.

C. B. Coulter of San Andreas, Calaveras county, reports finding free gold in quartz near the Ritter mine, near El Dorado, last week.

FRESNO COUNTY.

The directors of the Blue Diamond Oil Co., whose office is in Grass Valley, have decided to resume operations by July 1 on their ground at Coalings.

KERN COUNTY.

(Special Correspondence.)—The Merle B. M. Co., owning a group of three mines

at Havilah, report development work progressing. The ore runs \$44 per ton. A shaft is being sunk and two tunnels driven. W. T. Smith of South Pasadena is president.

Havilah, June 16.

President J. M. Wright, of the Peerless Oil Co., operating near Bakersfield, in his report says since November, 1902, eight additional wells have been completed and two more are drilling. The completion of these two wells will give a total of twenty-four operating wells. Two additional 70 H. P. hollers have been set at power station No. 1, two of same at power station No. 2, and two 55 H. P. hollers at pipe line pumping station. Two reservoirs have been built, with capacity for 60,000 barrels and for 100,000 barrels, respectively. These, with reservoirs 1, 2 and 3, give a total storage capacity of 230,000 barrels. The oil flumes have been torn away and replaced by a system of surface pipe lines, conveying the oil from wells and sump holes directly into reservoirs. Their production averages 4400 barrels per day. After finishing the next well (new No. 3) and after cleaning out certain wells which have become clogged, the production is expected to be 5000 barrels per day.

A. B. Canfield and G. E. Whitaker report striking oil last week in the first well on their property, 5 miles west of McKittrick. The oil was struck at a depth of 900 feet.

MARIPOSA COUNTY.

The Exchequer G. M. Co. has bought the O'Brien-Marriner group of five mines on the Merced river, 6 miles north of Hornitos, and work has begun with twelve men. M. O'Brien is superintendent. Development is by tunnels. Those forming the Exchequer Co. are the members of the Big Casino M. Co., operating at Groveland, Tuolumne county.

NEVADA COUNTY.

Two more concentrators to be used in the mill at the Oustomah mine, near Grass Valley, are being set up. As soon as they are in place the stamps will be started to dropping. The sand plant is ready for operations.

The Buckeye mine in Willow valley, near Nevada City, will have a mill this season, says Superintendent T. B. Gray.

Superintendent Coffin of the Central Con. mine near Banner Hill, near Nevada City, reports opening up a body of free gold ore in the tunnel.

It is reported W. F. Englebright, F. Zettler, F. Searls and J. Eddie will open up the Zeibright mine in Bear valley, near Grass Valley.

The rock crusher and other machinery for the Junction mine at North San Juan are being set up, says H. Huckins of Grass Valley, who is superintendent for Eastern men holding a bond on the mine.

ORANGE COUNTY.

Thirty-one wells are being drilled in the Fullerton oil fields and three rigs are in course of construction.

PLUMAS COUNTY.

Machinery for the Feather River M. Co.'s cement gravel mine at Iron Bar has been shipped from San Francisco, is reported on the ground, coming in via Beckwith, says Superintendent Goodhue, and it is expected the mill will be in operation by August 1. The company will begin operations on their quartz mine at Shoo Fly, near Crescent Mills, this month, and to that end have located a water right of 5000 inches at Shoo Fly falls. The water will be taken out at the falls and carried by flume 3300 feet to Shoo Fly bridge, near which a 500-foot tunnel will be driven.

SAN BERNARDINO COUNTY.

Work on the Higgins group on Newberry mountain, near Newberry, is reported progressing. At the end of the 150-foot tunnel drifting is being done on the ledge, the drift being in 50 feet, showing 5 feet of ore averaging \$10 per ton.

SAN DIEGO COUNTY.

W. R. Farnsworth reports finding molybdenite in his Dewey mine at Grapevine, near Warners Hot Springs. Some of this ore assayed 5% in molybdenum and \$12 in gold from the 60-foot level. The mine is developed to depth of 100 feet. There are 200 feet of crosscuts.

F. Salmons, of Pala, a director of the Lithia Chemical Co., which is operating a group of twelve lepidolite claims at Pala, says a reduction plant to handle the mineral will be built either at San Diego or at San Bernardino. Heretofore the ore in bulk, as taken from the mine, has been shipped direct to New York at a cost of \$450 per car, and \$25 per ton was still being made on the ore at the mine, says the San Diego Union.

Manager Phillips of the Douglas-Lacey Co. of New York has men at work unwatering the Owens group and cleaning out the drifts in the Washington mine near Julian.

SIERRA COUNTY.

W. H. Martin, of Nevada City, Nevada county, says the Sierra-Buttes mine, near Sierra City, has its 20 stamp mill running steadily.—The Keystone mine has run a crosscut and tapped its ledge, running along its course a distance of 300 feet, showing milling ore; 150 feet more will bring it under the shoot in the upper workings.—The Butte-Saddle mine has been bonded to M. Felin for five years.—The Sierra-Butte No. 2 mine, owned by W. H. Martin and San Francisco men, will be worked this season.

SISKIYOU COUNTY.

The Etna Advance says the Corey group of mines, adjoining the Tetherow & Co. (Highland group), at the head of China gulch, near Etna, was sold last week to J. M. Hadley, S. C. Phillips and W. Werst for \$10,000. The ore carries free gold.

The Blue Gravel mine, near Yreka, has been sold to A. W. Williams, who will put in electric power.

TRINITY COUNTY.

The Boyce & Breuner mine on Buckeye creek, near Carrville, has been sold to the California Surety G. M. Co. for \$5500. The company has incorporated at San Francisco with the following directors: C. W. Doe, C. V. Kaufman, S. V. Smith, H. Hume and J. R. Pringle.

The cyanide plant of the Northern Headlight mine, 2 miles from Carrville, on Coffee creek, was destroyed by fire on the 12th inst.; loss, \$10,000. It was started by an explosion of gasoline in the assay office. The general clean-up had been made two weeks ago and the product of the run shipped. The final clean-up, however, was being completed and the values sealed and stored in a room over one of the tanks. Those values, which amounted to \$7000, were saved by dropping into the solution tank under the burning building. This tank and four agitator tanks were the only ones saved from the fire. The Northern Headlight is owned by L. M. Hoefler of San Francisco and a company of Mexicans. The plant will be rebuilt.

TUOLUMNE COUNTY.

W. P. Cunningham has bonded the Blue Bell, the Turnback and the Rosella quartz mines near Carters for \$10,000.

COLORADO.

BOULDER COUNTY.

The Wano M. & D. Co., near Wall Street, is building an experimental process mill for the treatment of ore. If it proves a success, it is expected a mill of 100 tons daily capacity will be put up.

New York parties have bought the Golden Age mine, near Jamestown, for \$250,000. They are planning to build a cyanide mill and an electric power plant. C. H. Tallmadge is manager and M. J. Swisher superintendent.

In crosscutting from the main shaft in the Tambourine mine, near Wall Street, a body of low-grade ore has been struck, 20 feet wide and showing gray copper. Average value is \$9 gold per ton. The owners of the Tambourine are planning the erection of a cyanide mill.

The United States Co., composed of New York men, is developing a property in Deland gulch, near Caribou.

Coffin Bros. are operating the Confidence group, on Eldorado Mt., near Eldora, owned by G. W. Coffin & Sons. It is equipped with a shaft house, pump and a whim. The developments on the group consist of a 130-foot shaft and 350 feet of drift. The Confidence vein is 6 feet wide; the Lucky Find, 10 feet, and the ore carries tellurides and sulphides.

CHAFFEE COUNTY.

The Colorado F. & I. Co. has put in a 25 H. P. electric motor for pumping at coal mine No. 5, near Turret. Two other motors are to be placed—one for ventilating the mine and the other for screening.

CLEAR CREEK COUNTY.

The Standard group of mines and mill, up Fall river, near Yankee, were sold last week to the Colorado-Oregon M. Co. for \$150,000. The Oregon Co. is composed of Des Moines and Burlington, Ia., men, and D. V. Davidson is manager. They have been working a group of thirteen claims adjoining the Standard property for some time, and last winter opened up gold-bearing shoots which found their extension in the Standard group. The Standard has a mill with capacity for handling 125 tons of ore per day, and has both steam and water power. In addition to the two 100 H. P. hollers, it has a Corliss engine, a 12-drill air compressor and an electric light and power plant. The Standard group of claims have been opened up by a tunnel 1000 feet in length, showing different veins, several of which have been drifted on.

A shipment of thirty tons of lead concentrates was made from the Meadota mill at Silver Plume last week. An auto-

matic crusher feeder has been put in which carries the ore into the mill from off the dump and delivers it to the crusher.

The Continental Electric Power & I. Co. was incorporated last week by G. Haggett, W. P. Clough, C. S. Birkin, F. G. Shaffer of Clear Creek, with E. H. Martin, S. W. Mark and L. C. Bates. Its object is to furnish electric power for mining and milling in Clear Creek valley by utilizing the waters of Middle Clear creek at Empire, supplemented by a series of reservoirs. It is claimed from 3000 to 5000 H. P. can be generated, and 2000 acres of arid land irrigated. The object includes a general electric lighting business for the cities of the district. Work has been started on the main power plant at Empire.

DOLORES COUNTY.

Operations are under way at the Robinson group of mines in Horse Gulch district, near Rico, and the miners are drifting on the main tunnel.

OILPIN COUNTY.

Sinking operations were begun at the Cook shaft, near Central City, with three eight-hour shifts, and it is intended to sink the shaft a farther depth of 500 feet, which will take it to 1400 feet. To reach depth of lowest workings of the Bohall, it will be necessary to sink 250 feet, while 330 feet deeper than its present depth will reach the lowest workings on the Flak. The work of pumping and leasing is being done under direction of the receiver. O. B. Thompson is manager and W. H. Davis is superintendent. It is the intention of the operators to discard the Gregory incline workings and replace the steam machinery with electric plants, the power to come from the South Boulder section. There are fifty men, including lessees, at work on the group, but this number will be added to as new ground is opened up.

LAKE COUNTY.

Diamond drill explorations, besides opening up the silver, lead and iron deposits above the parting quartzite in the Coronado mine at Leadville, have at a depth of 75 feet farther struck copper deposits, says the News-Dispatch. This ore body is 300 feet below the bottom of the Coronado shaft and is said to overlay the Cambrian quartzite. Besides copper, it carries values in gold. Further drilling will be done to determine the size of the deposit.

MINERAL COUNTY.

C. R. Chapman of Bachelore has a two-year lease on the Punxsutawney claim on Campbell mountain, near Creede, paying a royalty of 12 1/2% on the net smelter returns.

There are 200 tons of crude ore passing through the Humphreys concentrating mill daily, making from forty to forty-five tons of concentrates per week, and only half of the jigs running, says the Creede Candle. An addition of nine concentrating tables is being made. With the addition to the tunnel equipment of a number of cars and several horses, it is expected to supply the mill with enough ore to run it at full capacity. With the increase in machinery it is expected to be able to handle 350 tons per day.

SAGUACHE COUNTY.

The Rough Rider G. M. Co. has a bond and lease on the Boston lode, near the Cochetopa, and have begun operations. A vein is showing that carries 34 gold per ton. If the vein proves continuous, an electro-chemical plant will be built.

SAN JUAN COUNTY.

F. House, C. F. Meek and J. Patterson, owners of the Iselde group of mines in Burrows Park, near Silverton, report making ore shipments. The extension of the railroad to be built from Eureka to Animas Forks will pass within 2 miles of the Iselde mine. Other companies operating in the Burrows Park section propose to increase work this season. The Bon Homme, owned by St. Louis, Mo., men, will resume, while the Tobacco Co. will put their 100-ton mill in operation. Manager Meek of the Lion tunnel, which is expected to cut many veins in the Burrows Park district, will again start up the machine drills.

Work was resumed last week on the Stober tunnel of the Silver Lake Co., east of Silverton. It is purely a tunnel site and the bore, which will eventually cut the Nevada vein, has its entrance on the hill above the Silver Lake power house and below the Aspen workings. At present work is being done by hand, but it is expected that machines will be put in this month. They are in 1500 feet.

SUMMIT COUNTY.

It is reported a body of good grade lead ore has been struck in the Lightburn tunnel in Gold Run, near Breckenridge.

The Casbler mine and mill, near Breckenridge, are making regular shipments of

concentrates to the sampler, says Manager Wood.

TELLER COUNTY.

Arrangements have been made whereby the Accident mine on Gold hill, Cripple Creek, will be worked through the Pointer shaft. By this the Accident can be worked at a depth of 100 feet below its present lowest level. To reach the ore shoot B. T. Hickman, who has a bond and lease on the Accident, will have to drift 50 feet beyond where the bottom Pointer level ends.

The following payroll distributions for May were made in Cripple Creek district last week:

Locality.	Men.	Total.
Battle	1,685	\$176,952 00
Ironclad	88	8,137 02
Guyot	181	18,027 60
Bull	1,531	160,755 00
Mineral	58	5,685 00
Raven	368	32,452 00
Beacon	264	53,136 00
Gold	540	53,136 00
Squaw	61	6,093 30
Tenderfoot	44	4,295 50
Womack	37	3,785 01
Globe	58	5,272 20
Cow	31	2,963 40
Grouse	10	948 00
Galena	9	810 00
Straub	27	2,527 20
Big and Little Bull	4	420 00
Lincoln	10	1,050 00
Copper-Rhyolite	54	4,999 20
North of Gillett	18	1,620 00
Rose Bud	7	630 00
Phonolite-Trachyte	23	2,070 00
West of Cripple Creek	35	3,150 00
Carbonate	1	105 00
Lines allied with mining	1,052	163,363 90
Total	6,286	\$654,778 21

There will be a decided increase in the payroll within the next ninety days. Just as soon as the water is tapped by the drainage tunnel and the various levels of the mines that are affected are recovered more men will be required for mining operations.

A good tonnage of ore is being made daily from the American Eagles and Abe Lincoln mines, owned by the Stratton Cripple Creek M. & D. Co., at Cripple Creek. The average of two broad-gauge carloads of ore a day being shipped from each averages \$45 gold per ton. On the American Eagles mine a washing machine is to be put in and all the rock in the dump will be handled. The machine will have a capacity of 200 tons of rock a day. In the American Eagles mine the ore is being broken in the fifth, eighth and eleventh levels. On the Abe Lincoln most of the ore is being broken on the bottom level in the ore shoot recently struck.

IDAHO.

ADA COUNTY.

The X Ray Con. G. M. & M. Co. has men at work grading for buildings at the mouth of the proposed X-Ray tunnel, 8 miles above Boise. The company has seventy-one claims in Black Hornet district, says Manager Dooley. The tunnel will start in Maynard gulch at elevation of 150 feet above the river and will pass under the Black Hornet mine at depth of 1639 feet, and is expected to be 2 1/2 miles in length. The Highland Valley Power Co. will furnish electric power for drills and tunnel cars, and lights for tunnel. A large smelter is proposed as soon as sufficient ore has been developed.

BOISE COUNTY.

Perce et al. of Denver, Colo., have bought the Wells group of three claims near Grimes Pass, near Idaho City, for \$22,500. They will run a tunnel which will gain a depth of 300 feet.

The Ingle mill in Charlotte gulch near Grimes Pass, near Idaho City, is in operation. The mill is run by electric power.

CUSTER COUNTY.

The Mackay Telegraph reports the Alto section, a new mining district, being opened up at the headwaters of Lost river, between Mackay and Ketchum. The district shows outcroppings of lead, silver and copper ores, the principal formations being limestone and granite. There is an abundance of timber and water. Ketchum, the nearest shipping point, is 16 miles distant. A. F. McKenna & Co. have men doing development work on the Douglas and Clifton claims.

Operations are progressing at the mines of the Boulder M. Co., near Mackay, says A. B. Fitzgerald. He has men running a crosscut from the bottom of the shaft to the hanging wall and 35 feet of lead and silver ore running \$15 per ton has been cut.

IDAHO COUNTY.

R. E. Davidson, manager of the Concord M. Co., operating the Ajax, Mother Lod and others at Buffalo Hump, is arranging for a steam hoist on the Ajax. The company will increase development work this year.

LEMHI COUNTY.

Manager Lo Slour of the Lo Slour Opal M. Co., operating the opal mines on Panther creek, near Salmon City, says he is putting up lapidary works to turn out the finished product of the mine directly on the ground.

SHOSHONE COUNTY.

D. Leshier is building a twelve-ton cyanide plant near the Mother Lode tailing dump, which he has secured from the Murphy Dev. Co. on tribute. It is estimated there are 200 tons of tailings on the dump.

The North American M. & M. Co., operating a group of eleven claims on Bug creek, east of Wardner, filed articles of incorporation last week; J. Presley, T. and T. Fahey and A. Murphy of Wallace, and A. Fahey of Burke.

The Chicago-Pierce Dev. Co. incorporated last week, principal place of business Pierce City, where a group of claims is being operated. A. G. Arnold, J. L. Dunn, W. Dahl, S. S. Johnson, E. J. Bower are incorporators. W. Dahl of Pierce is manager.

A number of improvements are under way at the Morning mine, at Mullan, including the addition of machinery to the concentrator. A system of ten more jigs have been added to the plant. These treat tailings that were formerly washed into the creek. Ten concentrating tables are also being put in. A vanner house has been built near the mill, which will be equipped with machinery. This will replace the slum tanks on the outside of the mill. A 50 H. P. Corliss engine will be set up in the vanner house, which will supply power for the lower part of the mill when the water power becomes insufficient. The two "high lines" which supply the mill with water power will be entirely rebuilt. There are 2 miles of flume, and this will be reconstructed.

J. L. Dunn and T. Wilkinson of the Wild Rose mine, near Pierce, report their mill operations show the ore to average \$10 a ton. No ore has yet been stoped below the 40-foot level. The mill has a capacity of one and one-half tons daily. The owners have awarded a contract for driving a 350-foot tunnel which will tap the ledge at 110 feet.

G. Turner of Spokane, Wash., is reported to have secured options on the Standard and Mammoth silver-lead mines near Wallace for \$5,000,000.

WASHINGTON COUNTY.

The Ladd Metals Co. has been organized and taken over all the holdings of the Con. C. M. Co., operating at Mineral. C. E. Ladd of Portland, Or., is president; W. H. Adams of New York, managing director, and B. L. Stayner of Portland, Or., manager. The company has bought the Iron Dyke copper mine in Oregon, across the Snake river from the Seven Devils district. Work began this week on the erection of a smelter at that point. The smelter will be of seventy-five tons capacity at first. The nearest railroad is Nagle, near Huntington, a distance of 50 miles. In this smelter it is said will be introduced a furnace which is heated by gas formed from pulverized slack coal. This gas is forced by jet into the furnace under the reverberatory.

MICHIGAN.

Although ore shipments by lake began two weeks later this year than in 1902, the movement to June 1st amounted to 3,000,000 tons, an increase of 150,000 tons over 1902.

The increase in the May product from the Copper Range Con. mines, near Painesdale, was more than expected, and their combined output was 1000 tons of refined copper. Some improvements are under way at the Baltic mill, which is operating all four stamps, as a result of which it is intended the capacity will be increased. The contents of the refined copper in the rock stamped during May was twenty-three pounds per ton, as compared with twenty pounds for April. The Champion is operating three stamps, not to full capacity, and no further increase seems likely until the 100-drill compressor is in operation, when the daily rock shipments will aggregate 2000 tons.

Houghton County.

The May output of the Franklin mine, near Hancock, aggregated 460,000 pounds of copper. The fourth head of Franklin stamps will be ready in October. Three heads now in use are stamping 1100 tons of rock daily.

The Osceola mine, near Calumet, produced during May 611 tons of refined copper. The volume of rock forwarded to the mill during the early portion of the month was only sufficient to supply three stamps, while the average for the entire period would keep five heads running steadily. There has been a constant increase in the volume of rock forwarded from the Kearsarge shafts. The bottom levels north of No. 3 shaft are reported

opening into good ground. No. 1 North Kearsarge is again in operation, having been enlarged to a three compartment shaft. The compressor at this shaft has been set up.

The product of the Quincy mine at Hancock for the past year was 19,000,000 pounds, secured at a cost, including construction charges, of 9 1/2 cents per pound. Construction cost equalled 1/2 cent per pound on the product, and with the reduced charges in this and other directions the current year's cost is not expected to exceed 9 cents per pound.

The No. 2 shaft at the Tamarack mine, near Calumet, was shut down last week to undergo repairs. The rock shipments during May show a decrease.

KEWEENAW COUNTY.

No. 4 shaft at the Mohawk mine, near Allouez, is being prepared as a producer. Foundations for the shaft and engine houses are ready for the structural iron.

The Ahmeek mine, near Allouez, has struck the Kearsarge amygdaloid lode in the crosscut run west. The crosscut was in a copper-bearing rock on the footwall for 20 feet before striking the main lode. It is reported that a consolidation of the Ahmeek and the Seneca is proposed.

ONTONAGON COUNTY.

The junction of the Branch vein and the Minnesota lode in the Michigan mine, near Mass City, was struck in the winze from the twelfth level to the crosscut from the Calico lode. Superintendent Brady says the lode shows heavy mass copper. The lower crosscut has 120 feet to go before striking it, and will prove the nature of the ground below the contact.

MINNESOTA.

SAINT LOUIS COUNTY.

D. M. Philbin, assistant general superintendent of the Great Northern road, will close his option for the mining lease on the Flynn Iron mine, near Hibbing. The eighty acres are owned by the State, and the owners of the lease are A. M. Chisholm and J. C. Flynn of Duluth and D. C. Rood of Hibbing, and the terms of the option held by Philbin are to pay a bonus of \$40,000 and 35 cents royalty. The minimum of ore to be mined annually on which royalty must be paid is 100,000 tons. The State royalty is 25 cents. The ore deposit is 165 feet in depth.

MONTANA.

BEAVERHEAD COUNTY.

P. M. Sweeney, owning a group of graphite prospects near the range between Lodge and Sheep Creek valleys, near Dillon, says development work will be done. Assays show 16% of graphite. The formation is a contact of lime and quartzite and the veins are 10 feet wide.

CHOTEAU COUNTY.

Superintendent W. M. McClean, putting in a cyanide mill on the E. W. King group, in the Little Rockies, near Landusky, says the framework of the mill is completed and the machinery is expected to be in operation by the first of July.

The Mission Peak M. Co. have started their stamp mill again, after lying idle all winter.

FLATHEAD COUNTY.

G. E. Shawler, manager of the Mustang Con. M. Co., reports suspending operations temporarily on account of the water in the tunnel. About 200 feet of work has been done on the Alabama claim by this company during the winter.

The American Kootenai M. Co. started up its stamp mill in West Fisher district, near Libby, last week. S. J. Morris is manager. There are twenty-five men at work in the mine and mill. The American Kootenai owns a group of claims on Blacktail mountain. These have been developed by a series of tunnels run at intervals along the course of the veins. The mill is 2400 feet down the side of the mountain from the claims and is connected with the mine workings by a bucket tram. The mill is run by water power. The ore values are in gold.

H. Hildebrandt of Cabinet reports having men at work on the Standard claims in West Fisher district, near Cabinet. The 800-foot tunnel will be driven ahead, and if the ledge is tapped as expected a mill will be built next season.

GRANITE COUNTY.

P. S. Mussighrod of Garnet reports a strike of free gold ore on one of his claims adjoining the Fairview mine. The vein was struck 60 feet from the surface. It is 4 feet wide and average assays yield \$26 per ton. He will start his mill if the lead holds out. The tunnel in which the strike was made is 200 yards from the mill.

The New York company that bonded the Copper State & Red Metal group near Stone will take up the bond and further develop them. A lead was cut last week which assays 12% copper. A number of

other claims are being developed in the same district.

In Red Lion district the Barton & Jones group, at the head of Warm Springs, has been bonded to the Montana M. Co. of Marysville, owners of the Drumlunnon mine, for \$40,000. The lead is 34 feet wide, with free-milling ore averaging \$5 per ton. Fifty feet from the main shaft on the Barton & Jones group is a parallel vein 2 feet wide, the ore running \$40 per ton.

Healy & Sheehan, who are working the Luxemburg mine, near Phillipsburg, have struck a pay streak 20 inches wide in their main vein, which runs well in gold. They have leased the Glenn mill and will run it on Luxemburg ores. The Gold Coin mine, in the same district, will be started up after an extended idleness.

JEFFERSON COUNTY.

Manager Hewett of the Cataract M. Co., which owns a number of properties in Cataract district, near Basin, has men at work preparing the site for the 200-ton smelter. The smelter will be on Jack creek, near the Cataract mines.—Regular shipments are being made from the Silversmith mine, in Basin district, the ore running \$150 per ton.—Kidney & Bay have a lease and bond on the Comstock mine, in Basin district, and will put in machinery and sink the shaft deeper.

LEWIS AND CLARKE COUNTY.

The Capitol Con. M. Co. of Helena report making a strike in their mine in Holmes gulch, 3 miles from Helena, and will put on more men and begin shipping. The strike is a contact vein, having 3 feet of shipping ore. The old workings in the mine were abandoned when 6 inches further work would have struck this vein.

MADISON COUNTY.

The Pacific mine, near Virginia City, has men at work and is running the mill one shift. It will be worked on full time as soon as the water supply increases. The Msphton mine made a shipment last week, says the Intermountain, of two cars of ore which run \$40 per ton.

The Speculator M. Co., near Pony, had surveyors at work last week on the Fourth of July ground, laying out a site for a mill. The company has temporarily suspended work on the Mammoth side of the hill.

Superintendent Carson has six six-horse teams steadily hauling ore from the Clipper mine to the N. P. Railway depot at Pony. These teams make two trips per day, bringing down seven tons to the load, a total of eighty-four tons per day. The ore averages \$20 per ton in gold. There are forty miners at work at the Clipper. It is expected work will be resumed on the tramway from the mine to the mill at Pony during the summer.

The sale of the Proctor Knott group to the Con. Copper Co. of Minneapolis, Minn., for \$50,000, is reported. The group consists of three full claims, 3 miles from Pony, and near the Clipper-Boss Tweed group, the Bozeman and others. The Proctor Knott has been developed to depth of 300 feet.

PARK COUNTY.

W. E. Stevens of Spokane, Wash., has a fifty-year lease on two copper properties near Springdale, being the Rambler and Mascott mines. Machinery will be put in and work started by July 1. They will be operated on a royalty basis.

TETON COUNTY.

At Dupuyer the Josephine C. M. & S. Co. has been incorporated to develop the Josephine and other mines near Dupuyer.

NEVADA.

EUREKA COUNTY.

The Tybo M. & R. Co. has preliminary work under way for improvements to be made in and around the mine and for resuming ore shipments. Additional machinery and mining supplies are on the ground. In addition to the Tybo output this company will handle the Revell ore.

R. S. McCaffery, manager of the Grand Deposit group of mines on Muncie creek, 12 miles from Aurum, says a boiler, hoist, a compressor and power drills are to be put in. Sinking to depth of 600 feet will begin this month.—At Aurum, Slegel Bros. of Salt Lake City, Utah, are increasing development work on the group of mines on which they have a bond. They are shipping ores that yield 100 ounces silver per ton. There is also manganese in the gangue, making a desirable flux.

HUMBOLDT COUNTY.

(Special Correspondence.)—The Sheba G. & S. M. Co. have put in an air compressor and are driving their lower tunnel on the Sheba cut to the contact. They are in 450 feet, with 400 feet more to drive, which will bring them 275 feet below the lowest workings, or a total depth of 400 feet. On their Mammoth group, farther up the canyon and west of the Sheba,

Superintendent J. T. Kessel has a tunnel in 185 feet, with 100 feet more to drive to cut the ore bodies at depth of 250 feet from surface. The company's ground covers a total of thirty-one claims in the Star mining district, 14 miles south of Mill City on the Central Pacific Railroad. There is a shaft and two levels opened from it, with 2000 feet of tunnels and drifts on the Sheba. The compressor plant and the mill of fifty tons capacity are both run by water power. W. N. Child of Salt Lake City, Utah, is secretary and treasurer. — Mill City, June 17.

LINCOLN COUNTY.

The Ione M. Co. has been organized at Los Angeles, Cal., and will operate in Searchlight. They own the six claims of the D. E. Miess Pompeian group and will also work two claims owned by Okey, Colton & Parsons, all of which are north of the Blossom group.

NYE COUNTY.

The merging of a number of mining companies, embracing several southeastern groups of Tonopah, have been completed, including the Fraction, Gold Hill, Salt Lake and Tonopah City companies. The Tonopah City ground adjoins the Fraction on the south, Salt Lake and Gold Hill on the west and New York Tonopah on the east. J. L. Butler, T. L. Oddie, W. and H. C. Brougher, U. B. Curtis, A. J. Crocker, W. J. Sinclair, J. Salsberry, W. Sperry, J. P. Hennessy and J. W. McCulloch are interested.

G. R. Duncan, D. S. Cohn, J. Ennis, J. H. Miles and C. Cohn have organized the Atwood M. & D. Co., to operate a group of eight claims northeast of the Sierra Vista Co. ground at Atwood. One of the claims will be reserved for townsite purposes, as on it are three springs. The other claims show ledges carrying gold, silver and copper.

The Tonopah-Kansas City Co., organized to develop the Northwestern, a group of claims northwest of the Hasbrouck, in Gold Mountain belt, near Tonopah, has the Clipper Bullion group and the Fraction claim. This gives them an east and west length of 4500 feet on the extension of the Gold Mountain veins, says C. K. Jarvis, secretary. Kansas City and Memphis capital is interested.

Taylor Bros. have bought a group of six claims on the east slope of Gold mountain, near Tonopah.

M. H. Seeley has bought the C. D. Wilson and C. A. Scheucks group of six claims, west of the General Thomas, in Lone Mountain district, near Tonopah.

T. G. Elgie, J. W. Douglass and W. J. Stoneham have bought a group of seven claims 1½ mile from Barrel Springs and 2 miles from the O'Meara-Lynch group at Alpine for \$6000. An 8-foot ledge showing assays of \$72 in silver and lead has been opened up on one of the claims.

The Tokop group, 60 miles south of Tonopah, have been bonded to J. Kelly of Bodie for \$100,000. The group consists of sixteen claims and the ledges, which outcrop to a height of 15 feet above the surface, carry gold values.

STOREY COUNTY.

A 30 H. P. electric motor and air compressor will be put in at the Caledonia mine on the Comstock lode, near Virginia City.

WASHOE COUNTY.

At the Desert King mine at Wedekind, near Reno, the vein has been opened 50 feet and carries 7 feet of ore having a value of \$33 in gold and 70 ounces in silver per ton. There are 200 tons of this ore on the dump and developments continue. E. Holman is manager of the Desert King and Wedekind mines.

The Con. Nevada Co., sinking on the Anna Bell mine, adjoining the Wedekind, is nearing the contact. At a depth of 170 feet the bottom of the shaft is in altered andesite, showing quartz stringers.

WHITE PINE COUNTY.

W. C. Rose & Co., who have an option and working lease on the Pine Nut silver mine, near Cherry Creek, report making shipments of high-grade black sulphide ore.

NEW MEXICO.

LINCOLN COUNTY.

The American Placer Co. at Jicarilla is overhauling and improving its plant, which has a capacity of 60 tons per hour. Water is plentiful.

J. H. Hinton will add another jig to his plant at Jicarilla, giving it 120 tons daily capacity. The jigs are used to separate the gold from the placer dirt in Juana gulch.—W. A. McIvers is opening an iron mine on Jack mountain, 4 miles northeast of Jicarilla.—F. A. Richardson, of Colorado, has resumed work on the Belle of Mexico and the Belle of Memphis mines at Jicarilla, the latter showing free gold.—The Hawkeye mine at Jicarilla has been sold for \$10,000.

TAOS COUNTY.

The controlling interest in the Paxton mine on Copper mountain, near Taos, has been sold to A. J. James, J. W. Sharp and S. Fromhold, who have begun operations.

Last week, the Jay Hawk mill at Red River resumed operations. The mill has been overhauled and repairs made. Ore is hauled to the mill from the Jay Hawk mine.

OREGON.

BAKER COUNTY.

It is reported the Northwest railway, from Huntington down the Oregon side of the Snake river, will be completed at least a part of this distance to the Iron Dike mine this year. A party of surveyors is in the field near Ox Bow, looking for a site for a 300-ton smelter for the Ladd S. & R. Co., says Manager C. E. Ladd of Portland. Ore will be furnished by the Cornucopia, Mineral, Iron Dike and Seven Devils districts. The surveyors are also looking into the project of tunneling Ox Bow for water power, taking water from Snake river.

E. J. Godfrey, of the Red Boy mine, near Sumpter, says the second ten stamps of their 20-stamp mill have resumed dropping.

W. W. Robbins, of the South Pole Con. G. M. Co., near Sumpter, says work has resumed in No. 1 tunnel. No. 1 is in 250 feet from the face of the vein. Before abandoning the level last winter a cross-cut was run 45 feet without striking the hanging wall. Work has resumed at this point. A winze will also be sunk from this to No. 2, and in addition a stope started to follow up an ore shoot showing values. There is another vein, 80 feet west of the No. 1 level, showing good surface values.

J. Thomsen, superintendent of the May Queen mine, near Sumpter, says he has drifted 120 feet on the ledge and has 3 feet of good milling ore. Six inches of the vein shows average values of \$30. More men have been put on. The 10-stamp mill will be started up next week for testing the ore, and Thomsen is getting in a supply of wood to begin running steadily by next fall.

Mill operations are again under way at the Psyche mine near Sumpter, says Superintendent Elmer, and twenty stamps are dropping.

President Hayes of the Beaver M. Co., owning holdings on the Elkhorn divide, near Baker City, says they propose to drive the crosscut tunnel and build a water power and electric transmission plant for their Balsley-Elkhorn mine. This tunnel, to open the Balsley-Elkhorn and other adjacent properties at depth, will be 5000 feet long. They have 8000 feet of air pipe and a 16-drill compressor on the ground.

A developing plant is to be put in on the Last Chance group in Cable Cove, near Sumpter, says Manager L. G. Lilley, who is in charge of the properties of the Baby McKee Con. Co.

Operations were resumed last week at the Imperial mine, near Sumpter, says Superintendent Paul. It is intended to sink the shaft and begin breaking down ore at the same time.—Construction work is again under way on the concentrator of the California mine, says Manager Bellman. The aerial tramway will be hauling ore to the mill as soon as the terminal bins are finished.

The Gold Reserve M. Co., of which F. W. Hilscher is president, has bought the Manhattan claim near Sumpter, in Bonanza district, near the Snowstorm and the Gold Ridge mines. Free gold is carried in the ore.

GRANT COUNTY.

The 5-stamp Isham Lawrence mill at Quartzburg is being repaired and additional machinery put in, says Manager J. W. Hughes, of the Equity Co., which owns the group.

JACKSON COUNTY.

J. A. Whitman and J. D. Heard of Ashland have begun operations on a group of placer claims on Steve's Fork of Steamboat lake, near Steamboat, comprising 880 acres of mining ground. They have twenty men at work and expect to be piling by July 15th. The water supply is sufficient to run the year round, except a few weeks in the winter when the water may freeze in the ditch. Later a 3-mile ditch will be built to cover their whole area.

JOSEPHINE COUNTY.

At the Gopher quartz mine, in Jump-off-Joe district, near Grant's Pass, men are at work crosscutting the ledge and taking out ore. The Gopher has a small stamp mill.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Le Roy M. & M. Co. has been organized to operate near Custer. Its

main office is in Minneapolis, Minn., and F. H. Cook, C. C. Looney, A. Q. Miller are the officers, with J. H. Sinclair of Denver, Colo., as manager. They own 185 acres of ground on French creek, near the Roosevelt group, Minnie May and Mayflower mines. The ore is principally quartz. The plans of the company are to put up a hoisting plant and develop the ground, beginning operations this week.

The Golden Crest mine, near Deadwood, has closed down its mill and is preparing to double its capacity.

The Ruby G. M. Co. has bought a mill site at Galena, a mile from its mine. There is plenty of water there also, and as it is considerably lower than the mine, the expense of transporting the ore will be low. A wire rope tramway will be put up for this purpose.

The Golden Reward Co. is running full capacity of 220 tons of ore per day in its cyanide plant at Deadwood, and is also shipping out smelting ore. Further development work has been done on the surface shoots of this company's property, the grade being lower than that heretofore found in the main levels, says H. Franklin, manager.

Fire destroyed the cyanide mill at Pluma, owned by New York men, on the 13th inst. Loss \$10,000. The plant was operating on Homestake tailings.

UTAH.

BEAVER COUNTY.

The Burning Moscow and Wild Bill mines, near Milford, are reported sold to the Royal M. Co. for \$150,000, and initial payment made by A. B. Lewis, president. Both mines carry ores with values in silver, gold, lead and copper.

IRON COUNTY.

W. H. Webber, manager of the Rambler mine at Grand Encampment, Wyo., says he will begin operations at the Hope group of mines at Stateline, which he has under bond.

JUAB COUNTY.

The management of the Star Con. M. Co. at Eureka are marketing ore on controls showing \$38 in gold, with 4.6 ounces silver per ton. With timbers on the ground, after many delays, Manager Packard says he will begin stoping on the 300-foot level, and expects to get out six cars a week hereafter. It has also been decided to resume work in the copper-bearing vein, as two parties have made the management offers to do it under lease.

With its waters under control, sinking the shaft on the South Swansea mine at Silver City was resumed last week, to continue down to the 950-foot level, where it is expected to still be in the vein. Meanwhile the Swansea is ready to resume, and, recovering its 600-gallon tank which was "drowned" some months ago, will begin raising water, says Manager Geddes.

Ore is being broken in the Star Con. mine at Eureka on the 300-foot level at rate of a car a day. Superintendent Packard has started a 20-foot raise from the 400-foot level to connect with the ore body opened by the Finn leasers. He has also started a raise from the 400 on a body of low-grade silver-lead ore.

PIUTE COUNTY.

(Special Correspondence.)—The L. & N. on Mt. Baldy gold belt, near Marysville, has been bonded to S. F. Mount of Richfield for \$50,000. Shipping ore is in sight and shipments will be made as soon as work gets under way.—At the B. W. & H. on Sevier river the tunnel conditions continue as usual. The fissure in which the lower tunnel is being run carries shipping ore.

The J. M. location on the west side has opened up a 20-foot vein of ore, which carries average values of thirty-two ounces silver and \$8 gold per ton.—The Belnap M. Co., down Sevier canyon at depth of 20 feet, has opened a vein 4 feet in width, averaging \$20 per ton in gold. W. S. Kennedy is president.

Kimball & Turner propose to build a stamp mill on their Gold mountain holdings, near Marysville. The ore runs \$15 in gold per ton.—Superintendent O. Larsen at the Snow Bird mine began operations this week.—G. Romney, Jr., and G. F. Dalton of Salt Lake City have made arrangements to erect buildings and begin permanent work on their group near Marysville.—F. M. Haughey intends to begin work on the 16 to 1 group. This property has a body of milling ore.—R. Dewitt of 10-mile reports the outlook encouraging in that section.—L. H. Bartholomew, president of the Copper Belt M. Co., is making arrangements to start the tunnel as soon as the material arrives. Marysville, June 16.

SALT LAKE COUNTY.

Manager E. W. Young of the Mystic Shrine mine near mouth of Markham gulch, near Bingham, says the main tunnel, following a fissure, is in 600 feet and is expected to cut the contact vein at 800

feet. Owing to bad air, but one shift a day is made, and a blow is being put in. A crosscut started west at 250 feet from mouth of main tunnel has been advanced 400 feet, and there an upraise is being made on a parallel fissure. In the Tin-horn (upper) incline there is a showing of 3 feet of pyritic ore that assays show to be smelting grade, carrying copper, lead, silver and gold.

Under a franchise obtained by the Highland Boy Con. of Bingham from the Yampa, the former is driving for its Leonard ledge, in which territory it has 700 feet along its strike. To tap this vein a drift was started from the 1500-foot station of the Craig tunnel and running through Andy ground; the management of the Highland Boy Con. expects to make connection with the ore body at a point 150 feet distant. W. R. Smith is superintendent.

The Columbus Con. M. Co., operating at Alta, has filed a notice to the effect that it has appropriated a portion of the waters of Little Cottonwood creek, which it proposes to divert from that stream through a pipe line 1 mile long, beginning at a point 4 miles above Wasatch, for supplying energy to two 5-foot impulse wheels. This is one move toward building a concentrator at the Columbus, which will be operated by electricity, generated from this source. The plant will be in Little Cottonwood canyon, 2 miles below the mine.

The Bingham West Dip Tunnel Co., whose mines are on the west slope of the Oquirrh range of mountains, near Bingham, are reported to be making arrangements to drive a tunnel directly through the ore-bearing range of Bingham, cross-cutting all the mineral veins on its course and later to extract the ore therefrom; also to develop the ore bodies on its own properties and to utilize its water, which will be increased by the drainage from the tunnel, for power and milling purposes. Men are at work and the tunnel has reached the length of 160 feet. The company owns 500 acres of mining claims, a reservoir and millsite. J. A. Silver of Salt Lake City is president.

With the consolidation perfected, the Butler-Liberal mines at Bingham will start up by July 1. It is intended to do considerable development work on the Snow Bird, the east claim of the Ben Butler group.

The Old Telegraph mine, at Bingham, has taken on more men since the temporary shut-down and has ninety men on the payroll.

The United States tramway at Bingham having been readjusted and strengthened, is transporting 500 tons of ore daily (filling the smelter's present demands on the Bingham mines), and is said to have a daily capacity of 1500 tons.

The Utah Apex Co., operating on the New York and Copperfield groups at Bingham, has incorporated. The organizers are E. W. Hastings, J. W. Horne, E. B. Webster and W. J. Carlin of Boston, Mass., and A. J. Orem of Salt Lake City. Manager Orem says developments have shown ore carrying values in lead, silver and gold, along with the ferro-sulphides carrying copper, gold and silver. The company has bought the Minnie, Eda and other adjacent locations.

The development plant of the New State M. Co., between the Cottonwood canyons, near Alta, is in operation, says Manager J. Dederichs. The shaft, which is at the mouth of the tunnel, will be sunk to depth of 3000 feet, from which point a crosscut will be driven to the ledge which has been opened up in the tunnel, showing 18 inches of gold-bearing copper ore.

The Highland Boy mines at Bingham, its smelter in Salt Lake valley and the entire holdings and rights of the Utah Con. G. M. Co. of England have been transferred to the Utah Con. M. Co. of New Jersey, and Manager R. H. Channing retained as manager for the new company. Although the Highland Boy mine has been owned by the Utah Con. for some time, it has continued under its original name.

SUMMIT COUNTY.

For crosscutting the country and ultimately connecting with the main workings of the Daly-Judge extending west along the mineral-bearing zone at Park City, the management of the Great Western M. Co. is preparing to drive from 1500 to 2000 feet, this avenue to be connected with the Judge's McSorley drift by an upraise from the latter, says the Salt Lake Tribune. Manager D. Evans reports other development work progressing.

TOOELE COUNTY.

The battery of retorts by which the quicksilver ores of the Sacramento mines of Mercur are to be reduced was fired up last week, says Superintendent McGee.

WASHINGTON.

FERRY COUNTY.

Operations in Meteor camp on the Col-

ville reservation are progressing. The Stray Dog mine, of which C. B. Olmstead is manager, is putting in a hoist and will stop ore from the 300-foot level. The Nonpareil, in which H. G. Brown of Spokane is interested, is planning to increase development. Manager W. I. Reddin of the Meteor group says Superintendent A. Wilson has men at work. The tunnel is in 60 feet. The White Swan will start next week.

STEVENS COUNTY.

H. Ranahan and W. Townsend report making a strike last week on the Copper King group, on Toulou mountain, 14 miles west of Bossburg. Twenty feet of copper ore were opened between granite and porphyry. The ore showed some gold values also. The Copper King is 1 mile south of the Orient group.

WISCONSIN.

DOUGLAS COUNTY.

The shaft at the Weyerhaeuser copper mine is down 212 feet. Considerable drifting and crosscutting is being done and the shaft will be continued deeper. The lode is wide and copper values are scattered as yet.

WYOMING.

CARBON COUNTY.

At Grand Encampment the aerial tramway is delivering ore at the bins at the terminal at the North American C. Co. It is expected the smelter will be blown in this week on sulphide ore from the Ferris-Haggarty mine.

FOREIGN.

AFRICA.

RHODESIA.

The Chamber of Mines at Bulawayo report the gold production of Rhodesia for 1902 amounted to 201,079 ounces, against 180,888 ounces in 1901. President Heyman deprecated the employment of white labor in the mines. The Portuguese government, he said, was doing its best to prevent Shangaas from proceeding to Rhodesia, and there was little hope at present of labor from Central Africa. On the other hand, only 12% of the natives working in Rhodesian mines were recruited locally. One thousand and fifty stamps have been ordered, but they could not be erected unless a sufficient supply of labor were assured. In deference to public opinion, the Chamber has decided to try Indians, but if these proved unsatisfactory they will have to go to China for laborers.

TRANSVAAL.

April returns for Transvaal mines show:

	Stamps.	Tons Milled.	Yield, Fine Ozs.
Witwatersrand—			
Crown Deep.....	135	18,725	6,977
Driefontein Con....	110	12,261	6,498
Durban Roodepoort..	70	8,500	4,995
Goldenhuis Deep....	160	20,700	8,952
Glen Deep.....	80	11,500	4,479
Jumpers Deep.....	90	14,901	5,901
Langlaagte Deep....	85	17,477	4,107
Nourse Deep.....	75	10,740	4,823
Robinson Deep.....	120	16,968	8,636
Rose Deep.....	110	17,614	6,462
Village Main Reef..	100	13,000	6,759
Nineteen other mines,			
total of.....	850	109,586	53,984
Outside Districts—			
Three mines, total of	70	9,522	5,003

This shows a net increase over March for thirty Rand and three outside mines of 130 stamps, and a net increase in output of 5798 ounces.

AUSTRALIA.

The Australasian gold production for the first quarter of 1903 is given as follows by the Australian Mining Standard:

State or Colony.	Fine oz. 1902.	Fine oz. 1903.
Western Australia.....	428,229	506,447
Victoria.....	151,427	169,837
Queensland.....	127,412	148,412
New Zealand.....	88,677	105,897
New South Wales.....	66,513	32,748

Total.....	862,258	963,431
Net increase for 1903..		101,173

NEW SOUTH WALES.

The total value of the minerals exported from New South Wales for the first quarter of 1903 was \$844,127, but it included copper and tin, valued at \$25,000, refined in the State from imported ore. Exports of coal were valued at \$412,000; silver, \$18,401; silver-lead concentrates and ore, \$284,194; copper, \$78,000; tin, \$51,499.

The gold obtained by dredging in New South Wales amounted to 25,473 ounces, valued at \$97,891, an increase of 1838 ounces compared with the yield for 1901. This output was from twenty-two bucket and seven suction dredges. Of these, 52% were operating in Araluen division. In the Stanthorpe district, there were three

dredges working for tin, and two others in the course of construction, while one other plant was equipped to save tin as well as gold.

The total gold yield for New South Wales for April, 1903, amounted to 31,200 fine ounces, making a total of 63,948 ounces since January 1.

QUEENSLAND.

The total gold yield of Queensland for the month of April was 67,193 crude ounces, or 369 ounces more than for April, 1902. For the first four months of 1903 the output has been 271,148 ounces—an increase of 29,748 ounces compared with the same period of 1902.

The tin output reported from Ingham for the first quarter of 1903 was 34 tons of stream tin, valued at £2890, and 41 tons of black tin, valued at £2788. Of this quantity 34 tons were from the Waverley company. The average number of men employed by the Waverley company is fifty. During the past quarter the company raised 933 tons of ore and crushed 990 tons. They also treated 115 tons of ore from the Freehold Tin M. Co., yielding 7 tons 6 cwt. of tin.

At Bundaberg the Mount Perry Copper Co., under the management of A. Gibb, are increasing their output. They have bought several additional mines in the district, including the Great Freehold, which alone will keep 200 men at work. The monthly shipments of copper matte through Bundaberg are increasing.

WEST AUSTRALIA.

Webster's Find battery at Malcolm, in North Coolgardie district, is in operation, and it is estimated there is enough ore in sight to keep the mill running six months. The reef averages 4 feet wide and runs half an ounce gold per ton. Development work will be increased.

A cyanide plant has been built on the Empress mine at Mount Magnet.

The enlarged mill of 20 stamps at the Hainault mine is in full operation, making an output of 2000 tons per month.

BRITISH COLUMBIA.

The Nellie Cotton and Mystic mines, near Phoenix in Greenwood camp, have been sold to J. E. and W. D. Everhart and M. Sands of Chicago, Ill., and first payment of \$10,000 made. The group adjoins the Ironsides and the Knob Hill mines, and the ore is gold and copper, with some silver.

Operations have resumed on the Athelstan mine of Wellington camp, 3 miles from Phoenix. Superintendent D. Oxley has put on more men and ore will be taken out. The Athelstan is owned by the Athelstan G. & C. M. Co., Ltd. J. Anderson is president.

The Kettle River mine in Kettle River district, owned by the Kettle River M., L. & P. Co., and composed of Spokane men, will be opened up this month. The company has been getting out lumber from their sawmill and a high water bridge has been built across the Kettle river to the railroad siding. There is a great deal of ore on the dump at the mine and this can be hauled across the new bridge for transportation to the smelter. The values in the mine are mostly in silver and lead, with some gold. The work to be started will consist of a shaft sunk on the ledge.

Manager Tonkin of the Crow's Nest Pass Coal Co., Ltd., in outlining the company's plans to further develop and increase the output of the coal mines at Morrissey, says a tail rope haulage engine will be put in at the head of the incline, above the tippie, for hauling empty and loaded cars. Track scales will be placed at the head of the incline for weighing cars of coal as they come out from the mine to determine the number of tons on which miners are to be paid. A tunnel will be run in an entirely new body of coal, known as No. 2 vein, which has not yet been worked. Two hundred additional mine cars will be used; ten horses are to be used to haul cars out of the tunnels. An exhaust fan, 18 feet in diameter, will be set up to ventilate No. 2 and No. 3 tunnels. The engine to run this fan is already on the ground. The contract has been let to drive a long crosscut to connect No. 2 and No. 3 tunnels.

White Bear shareholders' meeting at Toronto is reported to have decided to put in machinery at the White Bear mine, near Rossland, including a 20-drill compressor and a 125 H. P. hoist, with apparatus for the framing shed. Work will begin on the new head works. It is expected that sinking will be resumed at the White Bear. The main drift on the 850-foot level is being extended, but when the ore bodies for which the drift is headed are cut it is intended to cease work on that level and sink 100 feet, where another level will be driven.

For the third consecutive week the Snowshoe mine, near Phoenix, sent out 1680 tons of ore for the week ending June

6th. It has begun shipments, however, at the rate of 330 tons (11 cars) per day, or about 2300 tons per week.—The Big Copper and King Solomon mines in Copper camp are expected to begin shipping as soon as the C. P. R. spur is extended from the Mother Lode to the Morrison. There will be a wagon haul of 3 miles.

On completion of the 250 coke ovens in course of construction at the coal mines at Morrissey, work on 500 additional ovens will be started.

At Rossland the Spitzee mine's new head works are completed. At the White Bear arrangements are being made to sink to the 950-foot level.

At Lillooet, on the Fraser river, the Iowa M. Co. are putting in the first of eight dredges on a stretch of 3 miles of the river. J. Ames is superintending engineer. The dredge will have a daily capacity of 4000 cubic yards. Its cost, with equipment, is stated to be \$95,000. The company will make a special feature of saving the platinum, which exists in the black sands of the district.

The South Valley mine, on Howe Sound, 23 miles from Vancouver, has been sold to a London and Paris company. The group is on the south side of Britannia mountain, over the divide from the Britannia mine. J. F. Humphries of Philadelphia, Pa., former half owner in the claims, still retains an interest. The price was \$250,000 in cash, besides stock. Development work has begun.

The Tyee C. Co. at Ladysmith report to the head office at London, England, for May, shows 4260 tons of ore. The company ships its matte and the receipts for May were \$63,500.

The Stevedyke Partnership, near Atlin, have the season's operations under way and are building a flume, 4500 feet, from Pine to bring water for this year's prospect work.

Work is under way on Texada Island by a Tacoma, Wash., company, operating the Loyal mine, with Superintendent Denny in charge. H. W. Treat, manager of the Van Anda C. & G. Co., is in charge.

N. F. McNaught of Silverton, owner of the Hampton group, at the head of Springer creek, states that he will start work as early as the snow will permit.

MEXICO.

SAN LUIS POTOSI.

The Metallurgical Co. of Matehuala has selected the site for their smelter and construction will begin this month. It is intended to build three copper and two lead furnaces, representing a daily capacity of 500 tons. The cost of the plant is estimated at \$1,000,000.

Catalogues Received.

The Eugene Dietzgen Co. of 181 Monroe street, Chicago, has issued a supplemental catalogue for 1903 descriptive of their large line of Richter's instruments of precision, a class of instruments absolutely essential to correct draughting.

The J. Geo. Leyner Engineering Works Co. of Denver, Colo., have issued their catalogue for 1903. It is nicely illustrated, showing the Leyner drill and its method of working under ground and in quarries under the varying conditions found in practice. This catalogue cannot fail to be of interest to all users of power drills.

The C. O. Bartlett & Snow Co. of Cleveland, O., have issued Catalogue No. 8 on paint machinery. It is profusely illustrated and shows the various types of paint grinding and mixing machines, tanks, etc., and gives much valuable and interesting information on the subject of pigments and their preparation for the market.

The Westinghouse Electric & Manufacturing Co. of Pittsburgh, Pa., have issued an attractive pamphlet entitled "Electricity in Mining," being one of the industrial series of publications issued by them. It is handsomely illustrated and shows various types of dynamos, motors and electric engines employed in mining work. It deals with transportation, hoisting, pumping, ventilating, air compression, coal cutting and other phases of mining to which electric machinery has been adapted.

THE Goheen Manufacturing Co. of Canton, O., have issued an interesting and profusely illustrated catalogue showing the manifold uses to which their carbonizing coating is put. Steel buildings, pipe lines, industrial plants, stacks, bridges, mills, tanks and other metallic structures are protected, they claim, from the effects of dampness, acid fumes, smoke or other injurious attack. The illustrations in this pamphlet are interesting and show a variety of structures of steel, which have been protected by their carbonizing coating.

PERSONAL.

L. W. FELT has resigned as manager of the Model G. M. Co. at McCabe, Ariz.

E. A. DE HAVEN of Los Angeles, Cal., is in San Francisco, Cal., on mining business.

H. H. SCALES of Truckee, Cal., interested in Nevada mines, is in San Francisco, Cal.

G. PARO is superintendent of the Johnny Bull mine, near Rico, Dolores county, Colo.

E. C. VOORHIES, superintendent of the Lincoln mine, Sutter Creek, Cal., is in San Francisco, Cal.

S. I. MARCUM, a mining engineer of London, England, is examining mines in Northern Sonora, Mexico.

B. M. TAYLOR of the Zella and Argonaut mines, Jackson, Cal., is in San Francisco, Cal., on his way East.

J. B. EMPSON, of Deadwood, South Dakota, has been examining tin mines at Nigger Hill, near Tinton, S. D.

J. FARREL is superintendent of the McCabe mine of the Model G. M. Co. at McCabe, Yavapai county, Ariz.

J. H. STRITE, of Santa Cruz, Cal., has gone to Woldsky, Alaska, to put up a stamp mill for the Olympic M. Co.

H. F. BROWN, E. M., of San Francisco, Cal., has gone to the Okanogan country, British Columbia, to make mine examinations.

J. JACOBS of Colorado Springs, Colo., is superintendent of the Sultana mine, near Angels, Cal., vice A. Chalmers, resigned.

W. J. BEAGER, on account of poor health, has resigned as manager of the American Kootenai M. Co., operating near Libby, Mont.

S. J. MORRIS is manager of the American Kootenai M. Co., operating in West Fisher district, near Libby, Mont., vice W. J. Beager, resigned.

A. VAN DER NAILLEN, JR., manager of the Van der Nailen School of Engineering of San Francisco, Cal., is in Seattle, Wash., on business.

P. ARGALL of Denver, Colo., and C. W. Purlington of Doveton & Purlington left Denver, June 15, for a short professional trip to Nevada and Idaho.

P. MORGAN, formerly with the Utica M. Co. at Angels, Cal., is superintendent of the Mount Pleasant mine, near Grizzly Flat, El Dorado county, Cal.

W. S. TARBELL, business manager of the Mining Investor of Colorado Springs, Colo., has returned from a trip to Tonopah, Nev., and San Francisco, Cal.

R. B. TAYLOR, formerly of South Riverside, Cal., leaves July 1st for Antioquia, Colombia, South America, where he is interested in a group of placer mines.

J. EDDIE has resigned as superintendent of the Gold Tunnel mine, near Grass Valley, Cal., to accept a similar position at the Zehright mine in same district.

C. G. SCHREIBER is manager of the Model G. M. Co. at McCabe, Yavapai county, Ariz., operating the McCabe and Model mines, vice L. W. Felt, resigned.

J. T. KESCEL of the Sheba G. & S. M. Co. at Mills, Nev., has resigned and accepted the position of mill foreman of the Keith-Kearns Co. at Park City, Utah.

DEAN V. C. ALDERSON of the Armour Institute of Technology has been elected president of the Colorado School of Mines at Golden, Colo. He will assume the duties of his office July 1.

W. H. CHILD of Salt Lake City, Utah, secretary and treasurer of the Sheba G. & S. M. Co., is at their mines near Mill City, Humboldt county, Nev., after a business trip to San Francisco, Cal.

C. SWIFT, who for some time past has been mill man for the New Western M. Co. at Plymouth, Amador county, Cal., has gone to Ortiz, Sonora, Mexico, to take charge of the mill of the Bonacito M. Co.

J. F. PARKS, superintendent of the Kennedy mine, near Jackson, Amador county, Cal., returned last week from Palm Springs, Riverside county, Cal., where he has been visiting for several weeks.

P. TRANE has resigned as manager of the Golden West M. Co., operating in the Hornblende district, west of Rochford, S. D., and will spend the remainder of the summer in Bear Lodge district in western portion of the Black Hills.

Commercial Paragraphs.

THE Stillwell-Bierce & Smith-Valle Co. of Dayton, Ohio, report the Penohscot M. Co., of Deadwood, South Dakota, are putting in one of their Stillwell feedwater heaters.

THE American Diamond Rock Drill Co. of New York report they have recently sold several diamond drills to the Argentine Government. The Government of the Argentine Republic having decided to develop and prospect their mineral lands by means of the diamond drill, sent out an engineer to act in their interest and to examine existing machines and methods of boring; and the orders were placed after a tour through France, Germany, England and the United States.

THE Magnolia Metal Co., whose New York City factory was burned out in June, 1902, only a few weeks after the structure had been completed, are rebuilding on a larger scale, and the firm expects to occupy its new quarters about August 1. Meanwhile the metal business is being conducted at 511-513 West 13th street. The company has opened a factory in San Francisco, Cal., where all grades of babbit metal, including their "Magnolia" brand, are manufactured. Dwight Hiscox is Pacific coast representative, with offices in the Hearst Bldg., San Francisco, Cal.

THE Turner Brass Works, 53 North Franklin street, Chicago, Ill., are distributing to the trade copies of their new 66 page catalogue of gasoline torches and other gasoline appliances. It is fully illustrated and contains several new styles of double jet torches and other appliances recently placed upon the market. The Old Reliable torches and Straight-Turner brazing forges have been known to mechanics for several years, but the Turner gasoline bunsen light and Manyscope, Franklin torch, crucible furnace outfits, pressure indicating pump and several new styles of double jet torches are shown in this catalogue for the first time. A full description of the Turner double jet torches is given explaining the underlying principles. The demand for these torches, they claim, is increasing.

Books Received.

The annual report of the Minister of Mines of British Columbia for 1902 has been received. It comprises 320 pages of descriptive text relative to the coal and metal mines of that province, and includes numerous illustrations, which give a better idea of the character of the country than many pages of text.

"Index to Oil Wells in City of Los Angeles, Los Angeles Co., Cal.," is the title of the latest bulletin issued by the State Mining Bureau, Ferry Bldg., San Francisco, Cal.; L. E. Aubrey, State Mineralogist. It is accompanied by a map of the fields, showing the location of all wells, tanks and pumping plants. Price, 35 cents; postage, 2 cents.

The eleventh edition of "Mining Rights in the Western States and Territories," by R. S. Morrison and Emilio D. De Soto, of the Colorado bar, comes revised to date. This little volume of 530 pages is a compendium of mining laws, local rules, court decisions, forms, and office procedure, and other valuable information to a work of this character, and cannot fail to be of value to the mine locator, owner and operator. It also contains an interesting glossary of mining terms. Published by the Smith-Brooks Printing Co., of Denver, Colo.

Obituary.

J. ARNOTT, a pioneer miner of Sierra county, died at Alameda, Cal., on the 15th inst., after a lingering illness from a complication of diseases incidental to old age. Deceased was a native of Scotland, aged 75 years. He is survived by four daughters and one son.

A. H. COULTER, a pioneer miner and surveyor of California, and for several years county surveyor of Calaveras county, and a United States deputy mineral surveyor, died at San Andreas, Cal., on the 10th inst. Deceased was born in Charlotte, N. C., June, 1827, and came to California in 1849. He was Justice of Peace at El Dorado in 1863. He is survived by two daughters and two sons—one, W. S. Coulter, being at present county surveyor of Calaveras county.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JUNE 9, 1903.

730,431.—BRAKE LEVER—E. M. Akers, Ione, Or.
730,432.—BOX FASTENER—A. Bennett, Puyallup, Wash.
730,433.—ANIMAL TRAP—C. C. Bowen, Los Angeles, Cal.
730,434.—GAS ENGINE—A. M. Coburn, Daunt, Cal.
730,435.—BICYCLE BALANCE—M. L. Edmunds, Bandon, Or.
730,451.—BLANK HOLDER—R. B. Friend, Oakland, Cal.
730,452.—TOILET PAPER HOLDER—R. B. Friend, Oakland, Cal.
730,765.—BOILER—G. Hansen, S. F.
730,370.—LIFTER—W. H. Hendrix, Seattle, Wash.
730,463.—SIPHON TRAP—J. E. Keyt, S. F.
730,464.—STOVE—F. Krux, S. F.
730,677.—AWNING—H. C. Marcus, Bohemia, Or.
730,855.—PROCESS TREATING ORES—D. Mosher, S. F.
730,580.—WAVE MOTOR—G. Nobletodd, Los Angeles, Cal.
730,402.—ROPE TRAMWAY TOWER—B. C. Riblet, Spokane, Wash.
730,571.—GAME BOARD—H. H. Rolfe, S. F.
73,553.—SOLAR PRINTER—H. Stender, Los Angeles, Cal.
730,412.—FRUIT GRADER—R. Strain, Fullerton, Cal.
730,414.—DRILL TOOL SOCKET—E. Strickland, Los Angeles, Cal.
730,415.—UNDERREAMER—E. Strickland, Los Angeles, Cal.
730,490.—VEIL HOLDER—Pauline Tilt, Oakland, Cal.
730,587.—WRENCH—J. B. Tupper, S. F.
730,321.—CINCH PLATE—A. P. Weeks, Santa Cruz, Cal.
730,429.—AXLE PROTECTOR—G. Wood, Ballard, Wash.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PAD OR BLANK HOLDING AND FEEDING DEVICE.—No. 730,451. June 9, 1903. R. B. Friend, Oakland, Cal. This invention relates to a device for the convenient handling of blanks of all descriptions which are used in packages or pads of greater or less thickness, such as telegraphic or insurance blanks or checks, postoffice money order blanks, writing pads or any papers which are put up in similar forms. The object of the invention is to provide a desk with a rising and falling platform or surface upon which the pad or blanks may be supported, and by means of which the upper surface of the pad or blanks may be kept constantly at such a level as to be convenient for the writer.

TOILET PAPER HOLDER.—No. 730,452. June 9, 1903. R. B. Friend, Oakland, Cal. The object of this invention is to provide a cheap and convenient containing box for toilet and like papers which are interfolded and which when placed in a suitable receptacle present the edge of the paper through a slot, so that the withdrawing of the edge presented will not bring the edge of the following sheet or sheets into the slot and ready for withdrawal when the first sheet or series is removed. It consists of a box having dimensions sufficient to contain the paper, which is put up in packages of a thousand sheets more or less, a spring-pressed platform by which the package is held against the delivery side, a slit or opening through which the edge of the paper is presented, and means for holding the paper so that it will not be discharged in too large quantities.

Latest Market Reports.

SAN FRANCISCO, June 19, 1903.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 52½c, refined (1000 fine): San Francisco, 52½c; Mexican dollars, 41 @ 41½c San Francisco, 41c New York.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50 @ \$14.75; Electrolytic, 1 to 3 casks, \$14.50 @ \$14.75; Casting, 1 to 3 casks, \$14.00; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £57 2s 6d spot per ton.

The German consumption for foreign copper for January-April, 1903, compared with the same period of 1902, was as follows, in tons:

	1903.	1902.
Imports.....	27,260	27,309
Exports.....	3,833	2,905

Consumption.....23,427 24,404

The copper market is uneasy, but is apparently more affected by speculation in copper mine shares than by the actual condition of the market. It is expected that a few days more will serve to either strengthen the present market price or a decline in it. No one seems to be able to predict what the outcome will be. While it seems strange that speculation in copper shares should have an influence on the market, it does nevertheless.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½; pig, \$4.75. London: £11 3s 9d per long ton=2.75c per lb.

SPELTER.—New York, \$6.25; St. Louis, \$4.85; London, £20 2s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-

lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$28.00 @ 28 25; San Francisco, ton lots, 30½c; 500 lbs., 31c; 200 lbs., 31½c; less, 32c; har tin, 3½, 35c @ 37½c. London, £129 5s spot.

PLATINUM.—San Francisco, crude, \$18.00 3/4 oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$44.50 @ 46.00; large lots, London, £8 15s; San Francisco, local, \$45.00 3/4 flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16.75c.

NICKEL.—New York, 50 @ 60c 3/4 lb.; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$19.75 @ 20.25; gray forge, \$18 60; San Francisco, har, 3c 3/4 lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$29 60 @ 30.50; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

Danger in the Cut-Off Hole.

The life of the miner is one of constant danger when working at his employment; at least, that is the usual impression, though statistics show that there are other occupations more hazardous, which are popularly considered less so. Among the causes of accidents in mines, those resulting from premature or accidental explosion of nitro powder are probably the most numerous. Falls of rock from the roof; the unexpected caving of stopes; falling of cages, skips or other vehicles in the shaft, and the falling of men into shafts and winzes, and from high positions in stopes or raises, all contribute to the injury and death of men engaged in mining, and the defective fuse is also responsible for many casualties. Miners usually can guard against the slow, imperfect fuse, by giving the shot time, though defective fuse sometimes "hangs fire" for several hours, and very frequently for half an hour or thereabouts, but the danger from "cut off" holes is one most difficult to guard against, for the reason that the detonating cap may explode and discharge the stick of powder, in which the cap had been inserted, when the miners, who customarily listen and count the shots, would credit the blast with having been properly discharged. The powder still remaining in the bottom of the hole which was cut off on a jointing plane of the rock by a previous blast, forms the element of danger. Such a hole is often difficult to discover even when its existence is suspected. On the morning of June 16 this condition was the cause of an explosion which resulted in the death of a miner and serious injury of another in the Empire shaft at Grass Valley, Cal. A few months since an identically similar accident occurred in the shaft of the Lincoln mine at Sutter Creek, Cal.

In each case a "cut-off hole" containing powder was drilled into by the machine, and the succeeding explosion resulted in the death and injury of miners as stated. In each case, also, the men had been at work several hours, and had industriously searched for missed holes. Missed holes can usually be located, as the rock surrounding them, not being broken, is an index of their whereabouts, but not so the "cut-off hole." How such accidents may be avoided is a difficult problem, particularly in a wet shaft, where everything is covered by muck, making it almost impossible to find such a hole. By cleaning up

Fraser Mountain Copper Co.'s Camp, Twining, New Mexico. (See page 409)

and feeling carefully about with an iron bar, often under water, it being impossible to keep the bottom of the shaft absolutely dry, one may sometimes locate the hole, but the chances are against the miner finding it. By rare good fortune, too, he may fail to find it when drilling, but such was not the fate of those killed in the two accidents mentioned. Such occurrences emphasize the necessity of care under similar circumstances, for in each of these instances the full number of reports were not heard. The "cut-off hole," however, is a hidden danger often not suspected. The danger may possibly be lessened somewhat by placing the primer near the bottom of the hole, using the very best "triple tape" fuse. In following this method there is, of course, the possibility of setting fire to the powder, which would then burn without other effect than that with which the miner is familiar when this occurs, the filling of the

workings with a dense cloud of nitrous oxide, and complete failure of the blast.

The Need of Experience.

In the operation of low-grade mines success can usually only be assured or made possible by a combination of happy conditions or circumstances. If a gold mine, the vein or deposit should be extensive, the rock easy to break, not too expensive to support, and transportation must be inexpensive. Supplies must be obtainable at low cost; the ore must be free milling or offer no unusual difficulties in its reduction. Power must be cheap—free water power preferred; wages must not be too high; timber easily or cheaply obtainable, and the mine must have efficient, experienced management in every department of mine, mill and office. The more favorable these several conditions are the lower the grade of property that may be made to yield a profit. If it be a smelting proposition, the problems are fluxes, fuel, power, water, timber, process for reduction of the ores and comparative cost of several process, and in addition to these the market price of the product, which in a smelting proposition is usually a base metal, as copper, lead or zinc as well as possibly gold and silver. In this case competent management is even more essential, as the difficulties besetting the smelter are usually more numerous than those of the millman. Almost any one can successfully manage a rich, free-gold mine, but one must have experience to work a low-grade gold mine successfully, and technical chemical knowledge as well to operate successfully a smelting proposition.

AN interesting legal case has been before the Supreme Court of British Columbia, wherein the title to a mining location was adversed because one of the location stakes set upon the ice of a glacier. This post being set in the ice and not "in the ground," as required by the law, was argued by the plaintiff that as this post was not "set in the ground," as required by the statutes, the claim of defendant was not valid. The court has reserved decision and taken the case under advisement. While this case is of interest, it is fortunately one not likely often to occur, as there are few mining locations made under similar circumstances.

Another Milestone.

With this issue of the MINING AND SCIENTIFIC PRESS ends Volume LXXXVI. This volume contains 404 pages of reading matter and illustrations. Within these pages will be found a chronicle of the progress in mining and metallurgy the first half of the year 1903. There are many very valuable technical papers; descriptive and newsy articles from all over the mining world. The aim is constantly to present the latest and best in those subjects related to the mining industry, and to put these things before the readers of the MINING AND SCIENTIFIC PRESS in a form which will place a knowledge of technical, scientific and mechanical practice within the reach of all. The illustrations found weekly herein form a valuable part of the paper. The greater portion of them are specially engraved for this journal, and usually the photographs from which the engravings are made have been taken specially for this purpose. These engravings illustrate every phase of mining and metallurgy. By their means the readers of the MINING AND SCIENTIFIC PRESS gain an accurate knowledge of the situation and appearance of mining regions never visited by them. The great reduction works in various portions of the world; the mining practice everywhere—particularly that which is new or valuable—is also illustrated herein. In the advertising pages will be found, illustrated and described, every mining appliance which ingenuity and modern foundries and shops can produce. Nothing forms a better criterion of the onward march of progress in mining than the illustrated advertisements in technical journals. Attention is also called to the index accompanying this issue. By its use the reader may find any article on any subject published herein during the half-year just closing. The index should be preserved and bound with the papers forming the volume.

The Clairvoyant and the Miner.

Strange as it may appear, the clairvoyant is popular with the miner. One would naturally suppose that a man as thoroughly practical as a miner is supposed of necessity to be, would be the last man in the world to seek fortune through the medium of the clairvoyant, the fortune-teller or the astrologer; yet the miner is the constant prey of these "humbugs." The usual plan is for the miner, or mine owner, to go to the clairvoyant—one who has an established "reputation" preferred, one who has pointed out some of the richest mines in the country. The seeress—for they are usually women who ply this craft—takes the specimen of rock in hand and proceeds in a dreamy way to instruct the client in the geology of a rich ore deposit. The country rock is described. The size of the vein and its value are unmistakably outlined, and the sort of machinery necessary for its beneficiation is made equally plain, and the miner goes away dazed, not so much at the magnitude of the fortune that awaits him as by the fact that he fancies the fortune-teller has been able to correctly describe his property in all its detail, and that her diagnosis of the case agrees with his own. He proceeds to follow the ghostly advice as directed by the spirits, and about once in a thousand times he strikes it right. The percentage of success would no doubt be much higher if he would follow the dictates of his own common sense and experience, but to these he gives little credit when dealing with the mysteries of that unknown realm so familiar to the clairvoyant.

To recite the numerous disastrous failures resulting from blindly following the advice of clairvoyants would fill a good-sized book, for these instances far overreach the successes, and no one will deny that, in the case of the latter, success would have resulted without the aid or intervention of the fortune-teller. How any one can be misled by this class of fakir passes understanding. The clairvoyant is had, but no worse than the man with the "dowsing rod," the "gold finder," "divining rod" and other contrivances for fooling the credulous miner as well as others. There is no need to say the "ignorant miner," for he is usually not ignorant, and it is a matter of constant surprise to find well-educated people, who would place no confidence in the clairvoyant, blindly following the fellow with the "forked stick." The "professors" of this "graft" claim to be able to locate gold, silver, copper, lead, tin, zinc, diamonds, oil and many other desirable things. In order to do this they have "instruments" shaped like the letter Y, in the end of which the particular "batteries" for finding any stated mineral substance is secured. Then, with the forked ends in their hands, they walk soberly to and fro over the mineral ground. Suddenly they are observed to have a spasm—sometimes several—the nervous excitement is something pitiful to behold, but the work is done and the rich ore body has been located. The "professor" reluctantly permits a fee of \$20 per day and expenses to be thrust upon him, and the client—well, he proceeds to put up "assessments." One "professor" in the southern California oil fields had a "divining rod" constructed with particular reference to the location of oil lines. This remarkable instrument was fitted with a hollow hulk containing an ounce of the "professor's" blood. When ready to undertake the difficult task of locating the site for a new oil well—for that it is a difficult task must be admitted—he filled his mouth with water and began his strenuous work. Should he accidentally stub his toe and swallow the water or otherwise discharge the fluid from his mouth, the search could not be resumed until the following day, as the "professor" was completely prostrated by reason of his strenuous, nerve-tearing experience with the "divining rod," but his pay was \$20 per day and expenses, so the "professor" managed to stand it. How any one can be deceived by such chicanery and fraud is past understanding, but the victims of this sort of thing are not by any means rare. There are others, who have other instruments, who work in a different manner, but in one thing they are all alike—they all impose upon and swindle those who credulously employ and pay them for such services. There should be a law to protect the unwary from this class of sharks, and the law should provide a penalty which should be strictly applied.

A Blow at Fake Promotions.

The State of Connecticut has taken steps to protect investors in mining and oil stocks from being victimized by unscrupulous promoters. The new law is applicable to the stock of any mining or oil company, no matter under the laws of what State or Territory it may have been incorporated. It is the purpose of the Connecticut law to forbid the stocks of any mining or oil company being sold or offered for sale within that State before an affidavit shall have been filed with the Secretary of State giving a truthful statement of the financial condition of the corporation, the location of its property, the amount of development work done, and money expended in development and equipment, and the actual condition of the plant and the property. The Eastern cities have been flooded with stock of mining and oil companies that are purely fictitious, or, if possessing mining or oil lands, the same are of little or no proven worth. While this is a step in the right direction and will have a restraining influence on fraudulent promoters, still there are those to whom a sworn statement like that required in Connecticut would be a matter of small moment. Such a law without bonds would have little effect with some of those engaged in promoting fake mining schemes. While such a law as this would no doubt make it more difficult to place the stock of a legitimate as well as of an illegitimate enterprise, there would be fewer failures and mining would advance to a higher plane in the public esteem. Really there is no reason, other than the wholesale promotion of worthless schemes by irresponsible people, why mining should not stand as high in the estimation of investors as any other form of industrial investment. No other industry pays as large dividends on the capital actually invested as a successful mine. Profitable mines are made—are the result of careful development and the exercise of good business experience and sagacious, practical management, and not always the result of a lucky strike, though it is also true that the element of good fortune often makes it possible for the miner to realize far greater result from his investment than he has any reasonable right to anticipate. No other industrial pursuit affords as great opportunities. It is a knowledge of these facts and the recital of the stories of the sudden wealth coming to some men in mining, that makes it possible for the promoter to excite the cupidity of the would-be investor to the extent of making an exchange of mining stock for cash, and the investor too often awakens to the fact that he has not chosen wisely—that his mine is not one of the winners.

The Labor Situation.

It is about sixteen weeks since the coal mines at Ladysmith, B. C., were closed down by the owner, J. Dunsmuir, for the reason that the miners organized under the banners of the Western Federation of Miners. Mr. Dunsmuir is quoted as saying that he had no objection to the miners employed by him organizing a union, but objected strenuously to their affiliating with the Western Federation, that organization having its headquarters in the United States, and he would not permit a foreign organization to dictate the terms under which he could operate his mines, and would close them down forever if necessary. The mines were closed, and for sixteen weeks the struggle continued, with no sign of change or effort to effect a reconciliation on the part of the owner. The miners petitioned Mr. Dunsmuir to reopen the mines, and asked to be allowed to work on the same terms as before, agreeing to renounce the Western Federation. When Mr. Dunsmuir presented a contract to control for two years the miners objected to some of its terms and refused to sign, and the mines will probably still remain closed. The miners at Searchlight, Nev., are still out, and the owners and managers are in Los Angeles, Cal. This is the season when the heat is intense on the desert, and the managers evidently prefer life in Los Angeles to that on the desert, consequently no immediate settlement is looked for. There is no change in the situation at Randshurg, Cal. Nearly all the mines in the district are closed. The difficulty there is over an increase in pay. Conditions are much disturbed in Arizona, though in Yavapai county no trouble has occurred.

CONCENTRATES.

No anle acid affects either gold or platinum.

THE Legislature of Arizona has not adopted a code of bell signals. There is no uniform code in use in that Territory.

TETRAHEDRITE is another name for ordinary gray copper, a sulphide of copper, antimony and other metals, finely crystallized.

A CRITH WEIGHT is a technical electrical term. A crith weight is equal to the weight of a liter or cubic decimeter of hydrogen, .089873 grams.

THE name "tiff" is that by which fluor spar is known to Cornish miners, and the application of the term "tiff" to the small crystals of calcite occurring in Missouri lead and zinc mines is a misnomer. Calcite is also known as calcespar, limespar and Icelandspar.

THE average cost in the United States of refining copper and recovering from it the gold and silver is stated to be \$5 per ton. It is now thought this cost can be materially reduced by employing a higher current of electricity than usually used in the electrolytic method.

THE tendency to disintegrate on the part of concrete foundations for stamp batteries has been a problem at times difficult of solution. The best quality of concrete should be used. To overcome the absorbing of moisture the use of a cover or fold of oiled paper has been found of value.

PALLADIUM is separated from copper by saturating the solution containing the two metals with sulphurous acid, and adding a solution of potassium sulphocyanate. The reagent has no action on palladium, while it completely precipitates the copper in the form of a white sulphocyanate.

ORDINARILY alloys have a smaller volume than their uncombined constituents, but in the case of aluminum and antimony there is an expansion instead of the usual contraction. When 7.07 cubic centimeters of aluminum are alloyed with 12.07 cubic centimeters of antimony, the result is 23.71 cubic centimeters of alloy.

REPLYING to a question from John Day, Oregon: The commercial analysis of petroleum is effected by fractional distillation. The ultimate analysis requires a very comprehensive knowledge of organic chemistry. Would suggest sending to California State Mining Bureau, San Francisco, Cal., for Bulletins No. 3, 6 and 19; see, also, "Brant on Petroleum."

THE rock sample from Cerbat, Arizona, is not fluor spar, but feldspar (orthoclase, mostly). The rock has no commercial value where situated. When convenient to cheap transportation in some of the Eastern States a good, clean orthoclase is worth about \$4 a ton. It is used in the manufacture of tiles, pottery, etc., and also to some extent in the manufacture of glass.

TWO good books on petroleum are "Petroleum, Its History, Origin, Occurrence, Physical and Chemical Constitution, Technology and Uses," translated from the German by W. T. Brant (price \$7.50), and "A Practical Treatise on Petroleum," by Benj. J. Crew (price \$7.50). Either of these volumes gives a large amount of valuable information concerning petroleum oil.

A MINING CLAIM located October, 1902, in California, is not subject to relocation because of non-performance of annual assessment until midnight, December 31, 1903, when if the work still remains undone the claim reverts to the public domain and may be claimed by any one. The Federal statute requires that the first assessment work must be done within the year next succeeding the first of January following the date of location.

SILICIDES OF CALCIUM, BARIUM AND STRONTIUM are formed in the electric furnace at higher temperatures than those required to produce the carbides. The silicides decompose with water and yield free hydrogen in a pure state. These silicides give promise of importance in steel industries through their actions on sulphur and phosphorus. It is stated that, by use of these silicides, sulphides and phosphides are formed which are eliminated in the slag, and that an iron high in sulphur and phosphorus yielded by this treatment a steel from which the last traces of sulphur and phosphorus were removed.

BAUME was the name of a man who devised an apparatus for determining the specific gravity of liquids. This apparatus for liquids lighter than water consists of a hollow glass stem with a bulb blown in the middle so as to insure buoyancy, and another bulb in the bottom to hold mercury, like the bulb of a thermometer. A short distance above the upper bulb Baume made a mark and then poured sufficient mercury into the lower bulb so that the apparatus would sink in a 10% solution of salt and water to that mark. The apparatus (called a hydrometer) was then immersed in pure water, which is much lighter than salt and water, and of course the hydrometer sank deeper. The point to which the stem

sank in the water was carefully marked. The distance between these two marks was graduated into ten parts, called degrees, the bottom zero, the upper one 10. Water is therefore 10° Baume, written "°B. 10" or "10° B." There is also a Baume hydrometer for testing the density of liquids heavier than water.

WHERE A makes a discovery and claims 1500 feet along the lode in one direction from his monument, thereby placing his discovery at one end of the claim, and falls to erect his boundary monuments or stakes within sixty days, but has placed his claim on record, and begins the work of "annual assessment," and B comes along and locates a claim, and in so doing takes in a large portion of the ground claimed by A, the outlines of which are, as yet, unmarked, it is doubtful if the courts would recognize B's location. Some States fix the time by legislative act within which the boundaries of a claim shall be marked, but California has no such law.

THE crushing strength of structural materials can only be determined by actual test. The resistance which various kinds of material offers to pressure varies greatly. The best pressed brick will sustain from 555 pounds to over 4000 pounds per square inch. Granite from 4000 to 16,000 pounds per square inch. Limestone and marble 5000 to 20,000 pounds. Granite commonly ranges between 12,000 and 15,000 pounds per square inch, though some has been known to run as high as 35,000 pounds. This latter, from a quarry on the Connecticut river, was tested at the Watertown United States arsenal. Books on mechanical engineering usually contain more or less data on this subject.

BEACH MINING in California, although carried on in former years at many points from Lompoc in Santa Barbara county in the south to Del Norte county in the north, has never been a very profitable industry, and very little has been done in the way of beach mining in California for many years. At one time there were numerous "plants" of many kinds, ingenious and otherwise, for working the gold-bearing sands, but either the sands were too poor in gold or the machines too ill adapted for saving what gold was contained in the sands, for beach mining has been stopped. Northward in Oregon and in Alaska beach mining has been more profitable, particularly in the latter section.

THERE have been a multitude of oil burners patented on the general design of admitting liquid fuel into boiler furnaces. They may be divided into three types: (1) Mechanical spray in which the liquid fuel is forced under pressure through nozzles, made of such a form as to break it up into fine spray and thus render it inflammable; (2) spray burners, where the liquid fuel is held in suspension and driven into the furnace by means of a jet of steam and compressed air; (3) vapor burners in which the liquid fuel is volatilized and the vapor admitted to the furnace. All three have their advocates and possess a certain degree of merit. The second type is probably the widest known and in most extended general use.

METEORIC IRON found in the Canyon Diablo, Ariz., showed in the midst of the metallic mass two small transparent diamonds. The iron containing the carbon must have been at first in the liquid state, and by reason of a sudden cooling there occurred a violent contraction of the mass, the carbon passing from a density of 2.0 to that of 3.5, giving the diamonds. M. Moissan has successfully imitated the processes of nature and has produced microscopic diamonds by means of fusing iron saturated with carbon and an electric furnace. Two things detract from the value of these artificially produced diamonds—they are very small, and after a few months they tend to split and crumble into finest powder, "diamond dust."

IN masonry construction a good way in making concrete is to mix the cement and sand dry (this should always be done), and thoroughly drench the broken stone with water; then mix stones and mortar together without further addition of water until the mass has been well turned over. Then, while continuing the mixing, add water (by sprinkling, not dashing) until the proper fluidity has been secured. In a very wet foundation pit of small area good results may be obtained by pumping vigorously up to the last minute, then pulling out the pumps and quickly shoveling in the concrete without any further admixture of water, merely leveling it off and allowing the water to rise and percolate through it. It will soon get quite wet enough and can be settled in place by gentle ramming. The work is not finished when the concrete is made, mixed and rammed. All exposed surfaces should be kept constantly and thoroughly moist for an indefinite period, the longer the better. The top surface of a concrete foundation must be kept wet until it is covered by the superstructure.

MANY mines have replaced animal haulage with compressed air motors. There are, in general, two systems—the low-pressure system, in which air is compressed to 500 or 600 pounds, and the high-pressure system, with air pressure of 2000 pounds and over. The former system can be used in large galleries or tunnels or drifts where the width is ample and the track is reasonably straight. This permits a large receiver on the motor, 30 to 40 inches in diameter and from 8 to 16 feet long, to be handled with ease. The high-pressure system is used where the drifts are narrow or the curves on a small

radius, permitting only a small wheel base on the motor. Compressed air may be used cold on either of these motors, or the air may be passed to small tanks of hot water supplied to the motor at the charging stations. The air and hot water combination does almost double the work that cold air will do. These motors can carry sufficient air for any ordinary run desired and haul big loads. Two miles and return, with fifteen or twenty loaded cars, is not extraordinary, and from the general results obtained, the cost of haulage is from one-half to one-third of the cost of the animal power. The air escaping from the exhaust of the motor engines adds to the ventilating effect in the mine and the whole system harmonizes thoroughly with the power outfit of the average mine.

IF a metal be cooled very slowly past its freezing point, its structure will be comparatively large; if it be cooled rapidly past its freezing point, the result will be a much finer or more minute structure. In cooling slowly, crystals start to grow from a comparatively few points only, and the resulting structure is large; in rapid cooling, the points of initial crystallization are numerous, and the structure on complete solidification is small. When a crystal starts from a point it grows in all directions till interfered with by the growth of adjacent crystals. As the crystals seldom grow so that their crystallographic axes lie in the same directions, one finds on solidification that each has a different orientation. This difference in orientation is beautifully seen if one takes ingots of lead, tin, cadmium, zinc, etc., and lightly etches their surfaces. The effect of etching is to take off the surface of the metal, but not as a film of uniform thickness. The acid has not the same effect on each crystal, but removes more of one than of another, the amount depending on the position of the crystal with relation to the surface which is being etched. The acid follows the track of the secondary crystals, or rather grains, and so we have a step-like surface etched, which resembles, more or less, a broken surface of galena. Thus, light is more or less reflected from each crystal, depending on the angle at which the step-like surface is inclined.

ZINCBLLENDE is not materially affected by cyanide solutions, nor is the solution decomposed to any extent thereby, but oxidized zinc ores, like zinc carbonate, must be calcined before treatment. Alkali sulphides, when formed during cyaniding, will cause a loss of gold by precipitating the metal and covering it with a film of sulphur, preventing the gold from redissolving. The sulphur of antimony and copper sulphides appears to possess some peculiarity which causes them to form alkaline sulphides in cyanide solutions. These minerals are readily attacked by potassic cyanide, forming the salt known as potassic sulphide. Telluride ores apparently have no bad effect on cyanide solutions, as large amounts of ore containing these minerals are successfully treated in Colorado and South Dakota. Roasting of these ores is sometimes resorted to order to make them more porous, as when in this condition the rate of percolation is materially increased, and leaching is also expedited. Arsenical ores are a problem not wholly understood nor always the same. Those at Mercur, Utah, are readily amenable to this process, and at Del Oro mine, Ontario, Canada, the bromo-cyanide process is successfully applied to the treatment of arsenical ores. Manganese is not a harmful mineral in cyanide solutions so far as observed. Iron sulphide containing gold may usually be successfully treated by the cyanide process, but in some ores of this description extremely fine grinding is necessary in order to secure a reasonably high extraction. Vanner concentrates sometimes yield their gold readily to this process, but the percentage of extraction usually bears an important relation to the fineness of the material to be treated.

IN refining crude petroleum, the crude oil is run into a storage tank, sometimes of 25,000 barrels capacity, and thence is pumped into a still—a steel cylinder 12½ feet in diameter, 30 feet in length, holding about 600 barrels. With this still is a dome and gooseneck. By fire under the filled still, the volatile constituents of the crude oil are driven into the condensers where they are cooled and flow from the pipe as a liquid. These oil distillates that have come from the crude still are now put into a still worked entirely by steam, to drive off the inflammable gases that came with the product from the result in the crude still. The steam's heat vaporizes these gases and carries them into a condenser to be liquefied. The distillation is continued until the oil will stand the fire test. When the oil comes from the first or crude still, it is filled with gases, has a greenish color and a disagreeable odor. The gases have been largely removed by the steam still. The oil is now in a measure safe, but needs to be cleaned. It is run into a large vertical cylinder that holds over a thousand barrels. Generally this cylinder is lined with lead, as sulphuric acid is now mixed with the distillate. The mixture of oil and acid is agitated by air under pressure. When the agitation is done, the acid is charged with matter picked up from the oil. This acid with its charge gradually sinks by gravity to the bottom, free from the oil, which remains on top. As no acid must be left in the oil, it is neutralized by an alkali, generally soda, the soda being drawn away as the acid was. After these treatments with acid and soda, the oil is thoroughly washed with water, then run into broad, shallow, settling pans, where it is allowed to stand and become bright and clear.

Measurements Relating to Alluvial Deposits.

Written for the MINING AND SCIENTIFIC PRESS by
RALPH L. MONTAGU, Oroville, Cal.

The most reliable method of determining the value of an alluvial deposit (without going to considerable

will be noticed that the depths of a drill hole and the weights of gold taken are in duplicate.

When using one row of figures representing depth, the row representing weight of gold indicated by the arrows should be used.

The object of having these duplicate values for depth and weight is to insure accuracy when the results from shallow holes are determined. In using

yard. From this value a deduction has to be made that depends on the fineness of the gold taken from the drill hole.

If the weight of gold from drill hole should weigh more than 10 grains the result—i. e., the cents per cubic yard—should be increased in proportion. For example, if in previous case there was 14 grains of gold obtained from the drill hole the result would be

expense) is by means of a drill. The value per cubic yard of the gravel penetrated by the drill can be computed by treating the gold obtained as that contained in a column of gravel the length of which equals the depth of the bore hole, and the diameter of which equals a certain factor depending on the size of drill used.

This factor, when a standard Keystone drill is used, is 7.035 inches: i. e., for every foot of depth there is .27 of a cubic foot (or .01 cubic yard) of gravel in the column.

In Fig. 1 I illustrate a drill hole computer that was based on the above factor and gold 1000 fine. It

the computer, the horizontal line representing the depth of the hole in feet is followed towards the right until it is cut by the vertical line representing the weight of gold taken from the hole. The diagonal that intersects this point gives the value per cubic yard of gravel penetrated by the drill (gold 1000 fine).

Example—A hole 60 feet deep, weight of gold taken from hole 7 grains: Taking the left-hand row of figures representing depth we find 60, and following this line to the right the vertical line representing 7 grains (top row) is met; the diagonal line that intersects this point represents 50 cents per cubic

increased thus: 7 grains : 14 grains :: 50 cents : \$1.

On the other hand, when the depth of hole exceeds 100 feet the result has to be decreased in inverse proportion. Thus, presume a hole 150 feet deep, 35 grains of gold from drill hole. Divide 150 by 3 = 50. Follow the 50-foot line until the 3.5 grain line is met, the value per cubic yard shown by diagonal is 30 cents; this has to be divided by 3, giving value of hole 150 feet deep, producing 3.5 grains of gold (1000 fine), 10 cents per cubic yard.

In determining the average value per cubic yard of a body of gravel the results to be of any real value must be arrived at systematically. The ground

should be divided into rectangles of equal areas, drill holes put down at the intersection of the dividing lines; and every value and every depth must be used in order to find the true average value per cubic yard of the deposit.

When depths and values have been found, the following formula will give the average value per cubic yard:

$$A. V. = \frac{(x_1 \times y_1) + (x_2 \times y_2) + (x_3 \times y_3) +, \text{etc.}}{(x_1 + x_2 + x_3 +, \text{etc.})}$$

When A. V. = average value per cubic yard; $x_1, x_2, x_3, \text{etc.}$, = depths of drill holes Nos. 1, 2, 3, etc., in feet; $y_1, y_2, y_3, \text{etc.}$, = value in cents per cubic yard obtained at drill holes Nos. 1, 2, 3, etc.

The total number of cubic yards in the deposit can be found by multiplying the number of acres in the claims by the figure that appears in Table I opposite the average depth in feet of the gravel.

Table II will be of some value to determine approximately the cubic yards contained in a cut or excavation. The first vertical column gives the width across face of cut; the other columns give the cubic yards per foot length of cut for various depths to bedrock.

Example—Cubic yards required in a cut 210 feet wide, 34 feet average depth and 600 feet long. In the vertical column under 34 feet the number 264.44 is found opposite to 210 (width of cut): $264.44 \times 600 = 158,666$ cubic yards contained in cut. This table can be used to advantage for checking up (approximately) the ground handled by a dredge in the course of a week.

Chemical Analysis of Igneous Rocks.

The United States Geological Survey is about to publish a work of exceptional importance to students of igneous rocks and to geologists who have an interest in these objects. It is entitled "Chemical Analyses of Igneous Rocks Published from 1884 to 1900, with a Critical Discussion of the Character and Use of Analyses," by Henry Stephens Washington, and it will appear as No. 14 of the series of Professional Papers.

As its title indicates, it is a collection of all chemical analyses of igneous rocks published within a period of sixteen years, going back to the time of the last compilation of the kind by Justus Roth, a German geologist. All igneous rocks are products of the consolidation of liquid or molten magma. They are sometimes glassy, sometimes partly crystalline, and sometimes entirely so. It is evident from observation that any particular magma which has been erupted from the depths of the earth, through fissures, to the surface, where it issued in lava streams, has consolidated in different places with many different textures; and it is also known of many magmas that the resulting rocks may have different mineral composition, when fully crystalline, according to the influence of environment upon the cooling masses. The chemical composition is, therefore, the most fundamental or constant character of all these products from the eruption of any magma.

The tables of Dr. Washington give nearly 3000 analyses of rocks, from all countries in the world. It is interesting to note that by far the largest number, and also the best ones, are from the United States. The author lays so much weight on the character of the analysis that he separates the good from the bad on certain principles, and publishes them in two parts. The good analyses, some 1600 in number, are arranged by kinds of rock, classed according to the recently published quantitative classification of igneous rocks by Cross, Iddings, Pirsson and Washington. The reason for using this new system is that the old rock names mean so little in regard to this fundamental feature of chemical composition that the analyses can not be grouped in the most useful manner under those heads. The new classification, being based on chemical composition very largely, is suited to bringing analyses of similar rocks together. Certainly, the examination of the tables of good analyses shows that rocks which have practically the same chemical composition have been called by a great many different names under the old style of classification; and of course the converse is true, that the analyses of any rock family under the old classification are distributed among a good many divisions of the system adopted. The analyses which are too poor to enable

anyone to classify the rocks according to the new system are grouped in the second part, under the old names. By means of double and complete indexes, however, the author facilitates reference to all analyses of any of the older systematic rock groups, such as granite or syenite. The geographic index refers to all rocks of certain regions.

An interesting discussion of the value of accurate analyses of rocks to the science of petrography precedes the tables, and reviews the means of judging as to the quality of an analysis. The author enters an effective plea for careful investigation in this direction.

A New Mexico Copper Mine.

Written for the MINING AND SCIENTIFIC PRESS.

The plant of the Fraser Mountain Copper Co. at Twining, N. M., (see illustrations front page), consists of a 200-ton smelter and a 300-ton concentrator; also a converting plant and electric refinery. The entire works are operated automatically. Water is used for power as well as to carry the slag from the smelting furnaces. The Fraser Mountain mining dis-

Interior Fraser Mountain Copper Co.'s Concentrator, Twining, New Mexico.

trict comprises some of the best gold and copper-bearing territory in Taos county, N. M. It is believed by some that gold was washed from the creeks of this section long before the Spaniards entered the old pueblo of Santa Fe. Desultory and intermittent mining operations have been carried on for the past twenty-five years. About ten years ago considerable excitement followed the discovery of gold at Amizette, about 2 miles below the Fraser Mountain mine on the Rio Hondo. The Fraser Mountain mine is now one of the large producers of New Mexico. It is claimed this is the only plant in the United States making a copper carbonate concentrate. The formation is a mica schist, and the specific gravity of the copper being greater than that of the gangue, concentrates readily.

The company owns 800 acres of mineral land, beside a millsite and other lands in the district. The principal vein is from 50 to 60 feet wide, and may be traced by the outcrop for more than 1000 feet. R. McCalmont is president, W. Fraser is general manager, and F. J. Buck of Denver, Colo., consulting engineer.

The Bartlett & Snow Dryer.

The accompanying illustration is that of the Bartlett & Snow style F dryer, single cylinder rotary, which they have lately installed for Wood & Swart in their zinc works at Benton, Wis., and also at the Payne Consolidated Mining Co., Sandon, B. C. The dryer has a capacity stated to be up to four tons of concentrates per hour. The products of combustion pass first around the cylinder, then through it, that is, through the material that is being dried. When desired, a dust chamber is furnished. They report having a very large sale in this kind of a dryer, which is specially adapted for concentrates, being of medium weight and also medium price, simple in construction and can be fired with coal or wood as preferred. It can also be fired at the front or at the side, whichever is desired. It is manufactured by the C. O. Bartlett & Snow Co. of Cleveland, O.

The mine owners of the Witwatersrand are jubilant over the discovery of extensions of the known limits of the auriferous hanket.

Automatic Tailings Sampler.

Written by C. H. PEAD.

In 1887 I designed and erected an automatic sampler which I have used since with good results. It has been but little trouble to keep in running order, and about six months ago I made improvements in

It is necessary that the slot formed in the receiver A should extend above and below the stream being sampled and that it should be of even width throughout. The receiver A should pass at least 6 inches beyond the launder B, to prevent anything splashing into it when at rest.

The pipe aa is held rigidly by the brackets EE to the iron rods FF, which lie upon, but are not fastened

They are also perforated over a diameter of 6 inches at the bottom, this area being closed by the valve at L. The latter is automatically opened when the cylinder falls by striking the bottom of the box M, where a rubber cushion is fixed to deaden the stroke. The valve also closes itself automatically by its own weight as the cylinder rises.

On the bottom of the rods KK springs or rubber

Automatic Sampler for Tailings.

the mechanical construction which have overcome certain slight faults. The description is as follows, and is illustrated by the accompanying drawing:

A is the receiver or utensil that takes the sample of the pulp running from the launder B, and consists of a slotted iron vessel, the construction of which is difficult to describe, but is plainly shown in the sketch. At the lower end it is fitted with a 2 1/2-inch pipe aa, which carries the sample to the second receiver C, and from there through a₂ to the settling boxes DD.

to the cross rods ff, but run along them connecting the pipe aa with the receiver A when the sample is taken.

The rods FF are now run over ff on small wheels, which arrangement I find to be an improvement; the sketch not showing this alteration.

Connected with each side of the brackets EE are wire ropes which are led under the lower pulleys GG, are joined at H, and from there being led over the upper pulleys GG are attached to the cylinders JJ.

The cylinders JJ are fitted with guide pieces top and bottom ii, which run on the vertical rods KK.

cushions are placed to deaden the shock of the falling cylinders.

The cylinders are filled with water led through the pipe N, which is hung on a free bearing and is tilted towards each cylinder as it rises by means of the link gear shown at O.

The water discharged from the cylinders runs out through the valve at L into the box M, and from there may be led into the launder B beyond the receiver.

I have found that samplers operated by water have a tendency to hesitate when the weight of the stream being sampled strikes the receiver. To overcome

this I have introduced the releasing catch P, fitted with a thumb screw and with a movable weight. By means of these latter the catch may be so regulated that the receiver is made to travel at an even speed through the stream to be sampled, and more quickly or slowly as may be thought best.

Two settling boxes for receiving the sample, when taken, are shown. The pipe a_2 which feeds them is movable, and is turned by hand from one box to the other as required. This enables the sample to be thoroughly settled before the superfluous water is drawn off and the settled sample removed.

The advantage this sampler has over others that I have seen are that the receiver travels horizontally in a straight line across the stream, and is so constructed as to take a sample from every point of the stream in its passage; also that it travels at an even speed throughout its passage, and may be regulated to travel fast or slow.

I have also found that the falling cylinders and ropes are cleaner and more reliable than the tumbling box and levers.

Vibration in Batteries.*

Written by B. WAITES.

The theoretical position taken upon this question, and the base, or data, from which all following notes should be discussed and criticised, is that the maximum vibration of batteries which in practice should be considered and recognized as allowable and irreducible is what may be termed the "earth vibration," consequent upon the continuous dropping of heavy stamps at the highest practicable rate of speed. Vibrations resulting therefrom would be analogous to the vibrations experienced on the passing of a heavy railroad train, or the working of a steam hammer. The intensity and area of this vibration would be determined by: (a) The number of stamps running; (b) the weight of the stamps; (c) the number of drops per minute. In battery construction and erection the attainment of this minimum of vibration should be practically possible, and, therefore, no other working conditions of any battery should be recognized as being either satisfactory in its nature or first rate in quality.

The point from which this question is approached is that of considering the possibility of providing and erecting a structure upon foundations that would ensure a stability and steadiness of working conditions equal to the theoretical requirements previously stated, and also of providing some effective and economical method of reducing excessive vibration in batteries already erected and running.

A practical and economical way of immediately reducing excessive vibration of running batteries would be found in the following method, i. e., excavate between the mudsills immediately below the king posts, place upon a good stone bed a block of teak or other durable wood, clear away from the under side of the streaksill all soft or decayed wood until a good, sound surface is obtained, leaving a sufficient space between the prepared under side of the streaksill and the top side of the teak block for a good pair of "fox wedges;" these wedges could then be fitted and driven home until the foundations of the king posts were as firm as it could be desired to make them. If a space between the mudsills could be kept clear of silt and sands, these wedges could be tightened when required. A much better result could be secured by fixing a weighted lever behind the head of the top wedge, so that the automatic action of the lever would act upon the wedges and keep the foundations of the king posts constantly firm. The difficulty of operating in this manner upon the streaksill carrying the middle king post in any battery of ten stamps, as usually erected, will be sufficiently obvious, but the two mudsills on either side of the pile blocks could be so fixed in the manner indicated as to materially reduce any vibration if the state of the battery should imperatively demand some remedy. Stamp mills erected in batteries of five stamps each could be more easily dealt with in the manner described than mills erected in batteries of ten stamps each.

Having briefly indicated one method of reducing excessive vibration, which I have experimentally proved to be effectual, I will now endeavor to deal with the problem of providing the foundations for and erecting a structure which, so far as the question of vibration is concerned, should be a theoretically perfect mill. Assuming the thickness of the pile blocks at the top—i. e., the seat of the mortar boxes—to be 30 inches, the present practice of putting down parallel blocks gives the manifestly inadequate area of the mortar boxes—i. e., 5 feet by 2 feet 6 inches—as the foundation of an anvil bearing the impact of five stamps of say 1150 pounds each, and each stamp striking about 100 blows per minute. The parallel form of pile block, in view of the fact that more or less "canting" of these blocks occurs in running practice, may fairly be regarded as being obsolete. The true form of the foundations carrying the mortar boxes and receiving the force and impact of 500 blows per minute of 1150-pound stamps will be found to be of a tapering form which will allow of a

much increased area of bed. The material of such improved pile blocks may be of either iron or wood, which would be determined by the position of the millsite and the conditions of transport. Such a pile block, instead of being 5 feet by 2 feet 6 inches at the bottom, as now obtains, should be at least 5 feet by 6 feet 6 inches. Such form of pile block by reducing the liability of canting would also reduce the possible liability of vibration which would be caused by the jar of the canting block upon the mudsills, or the girts between the king posts holding the pile blocks in position.

The present style and form of foundations provided for the king posts of existing batteries on the Rand are, in my opinion, the chief causes of excessive vibration of the whole structure of a battery. Plainly stated, the foundations provided for the king posts ought not to be in any sense inferior to what is provided for the mortar boxes, and the present form of mudsills and streaksills can only be compared to the bird cage structures which the builders of railways use for the purpose of carrying their temporary bridges, etc.

Any foundation provided for the king posts of a battery ought to be of such a quality as to make it possible for the mill manager and the mechanical engineer to experiment with stamps up to and perhaps exceeding the weight of 2000 pounds each, in the full confidence that any weight of stamp up to that limit could be placed upon the foundations provided for the king posts, and work with the absolute minimum which has been termed the irreducible earth vibration. It may be accepted that the foundations of the king posts of batteries erected and running on the Rand do not fulfill the theoretical requirements with regard to this question of vibration with stamps ranging from 950 pounds to 1150 pounds in weight. The true form of foundations for king posts will in the future approximate to what has been before described as the true form of foundation for pile blocks, i. e., separate from and independent of the pile block foundations. They should go down to the same bed level, and be finished off at the same level as the top of the pile blocks. Any king post or its foundation would then be as easy of access as the mortar box, and by the simple removal of the tables the foundations of the pile blocks and the king posts could be examined and repairs done if required. The material forming this king post foundation could be either wood or iron, as transport conditions might decide. The streaksill would be utilized as a knee beam, and accuracy of position maintained by bolts, as is done higher up the king post. The mudsill in front of the line of pile blocks and king posts would be abolished, and the section of the timbers of a battery structure might be considerably reduced.

To summarize, the solution of the whole problem of this question of vibration of batteries lies in the nature and quality of the foundations provided for the king posts and for the mortar boxes. Such alterations and improvements in these foundations would not be more expensive during the life of the battery, as the more perfect conditions of running that would be attained would most materially increase the efficiency of a battery or the duty per stamp per day, and would also materially reduce the cost of maintenance during the whole period of the estimated life of a battery, and the highest attainable point of efficiency ought to be the only admissible standard of judgment.

Emerald Mines in Colombia.

Consul-General A. M. Beaupre of Bogota thus states the conditions prescribed by the Government for the presentation of bids and for the leasing of the Muzo and Cosquez emerald mines. These mines, the property of the Colombian Government, are to be leased to the highest bidder, the proposals to be received by the Government on Dec. 31, 1903. To be admitted as a bidder it is required:

"Not to be in debt overdue to the National Treasury, the fact to be established by a certificate issued by the Treasurer of the Republic.

"To produce the sealed proposals addressed to the Minister of Finance before 10:30 A. M., Dec. 31, 1903.

"To add a certificate of the Treasurer-General stating that the bidder has deposited in the National Treasury in American gold or in drafts on London, Paris or New York, payable, at most, after thirty days' sight to the order of the same treasurer and backed by a respectable bank in Bogota, or by receipts from the Credit Lyonnais, London Bank, or Union Bank, if the bidder is a foreigner, the amount of \$50,000 required as a guaranty against bankruptcy.

"To present a signed statement, accepting, without any restriction whatsoever, the stipulations. The minimum monthly rent shall be \$30,000 American gold for the ten years' lease. Proposals which do not cover this amount shall not be admitted. At all times the Government reserves to itself the right to inspect the mines, in order to prevent damages, and the liberty to declare the contract null and void by reason of said damages. The Government may occupy ipso facto said mines without applying to the judicial authorities, and even by having recourse to force."

It may be that there are those in the United States

who would be willing to gamble on emerald mines to the extent required in the above statement, but the average investor would require to know particularly what the stipulations were, and some objection might also be raised to the last sentence in the statement, to the effect that the Government may occupy the mines at any time without applying to the judiciary, even by recourse to force.

A New Crucible Furnace.

The Turner gasoline crucible furnace herewith illustrated is manufactured by the Turner Brass Works, 53 North Franklin St., Chicago, Ill., and presents many features of special interest to those connected with the mining industries.

This outfit consists of the Turner crucible furnace

New Crucible Furnace.

proper and the Turner gasoline blowpipe, together with crucible and tongs. It is very compact, portable, and can be used where gas and electricity can not be obtained.

It will be noticed that the gasoline blowpipe which supplies the heat is controlled by two valves, one of which regulates the air blast and the other the gas. In this way the operator has perfect control of the blowpipe, and the air and gas are mixed in the exact chemical proportions to produce perfect combustion; thereby is secured the maximum heat possible to obtain from gasoline.

This improved method of securing heat from gasoline produces a flame of absolute purity and is unexcelled for the most delicate chemical operations which can not be performed by the ordinary furnaces on the market, owing to the presence of sulphurous gases and other impurities.

Substances which resist the ordinary methods of reduction can be fused with ease, and the heat supplied by the blowpipe is far beyond what is required for most purposes. The black lead crucible holds about ten ounces of gold.

Every part of this outfit is made of the best material, and special care is used to make it produce the highest degree of efficiency.

When set up ready for use it occupies a space of only 5x12 inches, and packed ready for shipment weighs but 15½ pounds. It is nickel plated and presents a handsome appearance.

THE twentieth annual convention of the American Institute of Electrical Engineers is to be held at Niagara Falls, N. Y., June 29 to July 3. A large number of technical papers will be read at the meeting, among them one by Ralph L. Montagu, "The Electrical Equipment of the Gold Dredge"; "Some Notes on Certain Underground Hoisting Problems on the Witwatersrand," by A. W. K. Pierce, and "The Operation and Maintenance of High Tension Underground Systems," by Philip Torchio. These are the only papers thus far announced which relate particularly to mining.

ABOUT 247,000 tons of steel fly away in dust from the railroads of the world yearly, according to tables submitted to the mining and smelting section of the International Chemical Congress now in session, by Dr. A. Haarman, of Osnabruck, says the American Manufacturer. Of this amount 19,000 tons is lost through friction in the German railroads alone. The experience of Europe, it was also announced, had now demonstrated that iron ties are as cheap as wooden ties.

The Mining of Diamonds.

Written for the MINING AND SCIENTIFIC PRESS.

No branch of the mining industry is surrounded with more of romance, or with more of that element so dear to the heart of the miner—excitement—than that of diamond mining. Dame Fortune is as fickle in the diamond mines as she is elsewhere. The chance discovery of a diamond by a child, playing in the dooryard of a Boer farmhouse, eventually led to the opening of the wonderful mines of De Beers, Kimberley and other deposits. The entire history of the diamond mines in every phase of their development is one of evolution, from simple, crude methods to the perfected, scientific manipulation of to-day. The diamonds were first washed from the alluvial deposits along the Vaal river and adjacent low rolling hills. Eventually the source of the diamonds was discovered to be in vents, through which the dark, basic rock containing the precious stones was forced from below. These vents are rudely circular or oh-long in form. Each crater or vent was laid out in claims of about 31 feet square each. In the early history of the mines, no consolidation of a greater number of claims than five was permitted. As depth was gained in digging out these large deposits, several hundred feet in diameter, the claims became clearly indicated by the variable progress of work on the several holdings. Those which proved rich were usually worked with more energy than claims which proved less remunerative, and soon there was great discrepancy in the height of these blocks of ground. Roads were left crossing the tract, but as the holes grew deeper, the rock caved along the roadways and these thoroughfares, already as narrow as they could be and still serve their purpose, became useless. Finally the roadways were mined and then resulted in the ingenious system of wire tramways, reaching from the rim of the crater to the individual claims, of which there were several hundred. These hoisting rigs with their wire ways extended entirely around the rim of the craters at the several mines. In time the hoisting arrangements were built "three stories" high, the lower hoists operating those claims nearest the rims, the second tiers of hoists served the same purpose for intermediate claims situated farther from the rims, and the uppermost tier worked the center. Despite the heavy caves of rim rock into the constantly deepening craters, excavation was carried on until the bottoms of the great pits were from 400 to 500 feet deep. Eventually the caves of rim became so large and so disastrous that the method of open-pit mining was abandoned, becoming too expensive. The system of hoisting from the pits went through the various stages of improvement, the same as mining and treatment of the diamonds. At first the "yellow" dirt was shoveled into carts or hand harrows and hauled or carried away along the roads, later windlasses were put in to work the deepening diggings. Then horse whips were introduced, which were finally followed by steam hoists. The first shafts were sunk in the bottoms of the pits themselves; later, shafts were sunk out in the rim rock at considerable distance from the craters. Some of these were vertical, some were inclined. After many years of expensive work as individual claims or as small consolidations of a few claims, it became evident that only by consolidation could the mines be operated at all, and large companies were formed. Finally these were consolidated as the De Beers Diamond Mining Co., which controlled all the mines of South Africa, and those of Brazil as well.

Not less interesting was the recovery of the diamonds. Those at first found were loose in the gravel and sand found on the low, rolling hills of the veldt. Later, when the vents were discovered, the ground near the surface was soft, oxidized and yellow in color. The harder lumps were easily pulverized with a blow of a pick or a shovel, but gradually the rock became more firm and darker in color until the "blue ground" was entered below the oxidized zone. Here the rock was hard and had to be blasted out. It was found, however, that upon exposure to the air it disintegrated. It was also discovered that alternations of rain and sunshine caused the disintegration to proceed rapidly. Large "floors" were prepared on the semi-desert plain. Suitable locations were selected, the brush and grass removed, the ground leveled, sprinkled and rolled by heavy machines. The blue ground is now conveyed to the floors, which cover hundreds of acres, by means of steel cars with mechanical rope haulage, and branching tracks traverse the floors. The diamondiferous rock is dumped on the floors, where it often lies for months during the process of disintegration. This is sometimes facilitated by sprinkling, but of course this can only be accomplished in a limited manner, due to the scarcity of water and the vast extent of the floors. This disintegration is further aided by harrowing the ground. This process has also been greatly revolutionized and improved. Originally done by hand, it is now done by traction gang plows or by stationary engines hauling plows back and forth across the field.

Diamonds are of relatively high specific gravity,

and are separated from the gravel, the soft yellow ground or the disintegrated "blue" by washing. In the process of concentration, not only diamonds but other minerals of high specific gravity are separated from the gangue. These are pieces of iron ore, garnets, etc. The final separation has been done by hand by expert pickers. The method now in vogue is as curious as it is effective. There would doubtless be a disposition on the part of many to apply the test to the method here described were the material available, but there are few who have diamonds lying about in the gravel of their dooryards, for such experiment. The discovery was made by a young man named Kersten, who was employed in the sorting room at Kimberley.

One day, by the merest accident, he made the discovery. A rough diamond and a garnet happened to be lying on a small board on the bench where he was working. He happened to pick up one end of the board when the garnet slipped off, but the diamond remained.

This was a phenomenon worth investigating. Kersten found that there was a coating of grease on the board which had retained the diamond, while the garnet had slipped off.

He procured a wider board, coated one side of it with grease and dumped a few handfulls of concentrates on it. Then he found that by holding the board in a slightly inclined position and vibrating it, all the concentrates except the diamonds moved to the lower end and fell off, while the diamonds remained in place.

Then he invented a machine by which his discovery might be utilized. One part of his machine was a slightly inclined table coated with grease and vibrating when the machine was in motion. Another part was a sort of hopper through which the concentrates, with a small current of water, passed to the surface of the vibrating table. Considerable study was required to perfect the apparatus, but at last the machine was completed and the diamond men were invited to witness the new method of separating diamonds from the rest of the concentrates.

The invention was an entire success. All the garnets and other minerals that are not wanted pass over the surface of the table, while every diamond, large or small, is retained.

The Griffiths Automatic Hammer.

In mining blacksmith shops heavy jobs are more or less frequent. This work is more often done by an extra helper or so (as the case may be), being required. Power is usually at hand, but means for

The Griffiths Automatic Hammer.

applying such is lacking. The Griffiths automatic hammer, herewith illustrated, is a machine calculated to fill these requirements, simple in construction and easy to manipulate. The hammers are being built in weights of from 50 pounds

to 500 pounds. The rapidity of the stroke is regulated by the size of the pulley, and also by the pressure of the idler pulley (seen back of upper right-hand corner of frame) on the driving belt. This idler is operated by the foot pedal shown in front of the anvil base. Because of this pedal arrangement one man can readily handle the piece of work and attend to the machine at the same time. The semicircular steel springs and the leather cross-straps connecting through the top of the hammer permit of a variable length of stroke. The turnbuckle on the crank arm will accommodate the machine to pieces of work up to 6 to 12 inches in height; and for greater heights (as in the case of "upsetting"), the anvil face can be lowered, the anvil block being built in sections. It is well adapted for all kinds of welding and drawing work. The accompanying cut shows a wagon tire in position for welding. The machine is self-contained and built of flexible steel I beams. T. H. Griffiths, No. 85 Fremont street, San Francisco, Cal., is inventor and sole manufacturer.

Compressor Explosions.

A great deal has been written of late in regard to the causes which lead to explosions of air compressor cylinders. In fact, this subject formed the basis for a most interesting discussion which took place at a recent meeting of the American Institute of Mining Engineers. Few accidents of this kind have ever happened on the Pacific coast, and it is only natural that they should excite more or less interest when they do occur. Therefore, the recent accident at the Fremont mine, near Amador City, Cal., unfortunately causing the death of the esteemed superintendent, C. E. Purrrington, opened the door for considerable conjecture as to the cause, which has only now become known. The machine is a 20½x24-inch duplex Ingersoll-Sergeant air compressor, and, knowing that an accident of this kind might be used as an argument against this make of machine, the manager of the Fremont Con. Mining Co., Arthur Goodall, wrote the following letter, under date of June 14, to Messrs. Harron, Rickard & McCone, the agents on the Pacific coast for the Ingersoll-Sergeant Drill Co.:

MESSRS. HARRON, RICKARD & MCCONE,
San Francisco, Cal.,

GENTLEMEN:—

In justice to you, as agents for the Ingersoll-Sergeant Drill Co., it appears to us only proper that we give you a statement of the cause of the exploding of one of the cylinders of our 20½x24 inch duplex Ingersoll-Sergeant air compressor on the morning of Saturday, June 6. The accident was due to the closing of the discharge valve while the machine was in operation.

You are at liberty to use this letter as you see fit.

[Signed]

ARTHUR GOODALL,
Manager Fremont Con. M. Co.

Mexican Duty on Explosives.

Going into effect July 1, a number of new rates will be effective in the Mexican customs department, says the Chihuahua Enterprise, covering the duties on certain articles imported into Mexico. Among these is a change in the rates of powder. The new ruling provides that dynamite and industrial explosives entered through the custom houses of the republic, or manufactured in the territory of the republic, will pay \$210 per ton. Exemption from said tax may be allowed in the case of common gun powder, black blasting powder for mines, and gun powder for fireworks or for hunting purposes, in the composition of which the only ingredients used are sulphur, carbon and the nitrates of soda and potash, and not nitro-glycerine, chlorate of potash or other chemical explosive.

German Inquiry for Red Zinc Ore.

Consul E. A. Man, of Breslau, Germany, May 19, 1903, reports that he has an inquiry from a prominent local firm dealing in metals, ores, etc., for large quantities of red zinc ore, regardless of whether it is calamine, galmei or blende, or what percentage of zinc it may contain, the important requirements being that it shall possess a purely natural red coloring. Anyone who can furnish such ore is asked to communicate with the consulate.

ALTHOUGH the expenditure occasioned by the war in South Africa is so much dead loss, says the South African Miner, the period was not altogether lost for some ventures. The Orange Free State and Transvaal diamond mines, for instance, had done little more up to the beginning of the war than haul blue ground on to the floors. The result is that they have now 200,000 loads weathered and ready for washing. This working has now been begun on a scale limited by transport and native labor. A good average of stones has been recovered.

THERE are places where cyaniding is in progress and the extraction of values reaches or exceeds 80%, but owing to the original high value of the ore the tailings are still worth \$2 and over per ton, which in the future will be saved, but which in the haste of making large tonnage and quick profits are now allowed to escape.

Cyaniding in the Black Hills, S. D.

Written for the MINING AND SCIENTIFIC PRESS by
J. B. EMPSON.

The ore which is at present being treated at the Dakota Co.'s 30-stamp wet crushing mill is of a quartzite nature from the Cambrian or Potsdam formation, the values in which are presumably mostly carried along the cleavage planes, allowing of a fairly coarse crushing. The ore is very hard, carrying about 80% silica, a small amount of iron, mostly in the form of ferric-oxide, and about 3% to 4% of sulphur, probably in combination with some of the iron in the form of a very fine pyrite. Alumina, calcium carbonate and magnesium oxides are present in small quantities. The ore occurs in flat bodies of large extent, lying one above the other, with beds of shale or sandstone between. The ore at present being mined is taken from the surface and is mostly low grade, carrying approximately equal weights of gold and silver. Most of the mining is done by means of "open cuts," as the ore lies in large deposits within 18 feet of the surface of the ground. The actual cost of mining the ore and loading it into cars is 90 cents a ton. The ore is hauled by the railroad 10 miles to the mill in Deadwood at a cost of 75 cents a ton. On arriving at the mill the ore is dumped from the railroad cars into three storage bins of a capacity of 200 tons, from which it falls by gravity to a No. 4 Gates crusher, which breaks it to pass a 2½-inch to 3-inch ring. The ore is then raised by means of a bucket elevator 42 feet to the battery bin, holding 300 tons, whence it falls by gravity to six automatic suspended Challenge feeders, and is fed to the stamps, thirty in number, with a 9-inch drop and ninety drops per minute. Stamps are in units of ten. Blanton cams are used. The mortars are of two patterns, four being the double-discharge silver mill mortars and two being of the Homestake narrow fast-crushing type. It was found that in using the double-discharge mortars with a fairly coarse screen that, unless the volume of solution passing was much increased, the solution would get out of the mortars without carrying with it the proper amount of sand, consequently lessening considerably the capacity of the mortar. On this theory the back of the mortar was closed up with a sheet of steel plate ⅝-inch thick and the mortar used thereafter as a single-discharge. Screens in use are approximately 6-mesh (wire .054); size of opening, .113 of an inch. Depth of discharge is kept about 4 inches. Volume of solution passing is about in the proportion of 4 to 1. The ore as it falls into the mortars is met by a stream of cyanide solution in strength 0.10% KCy. As the pulp leaves the mortars it flows by gravity to two hydraulic classifiers, in which the slimes are eliminated from the sand, the first box being a spitzkasten and the second box a combination of spitzkasten and spitzluten. The sand issuing from the bottom of the classifiers is pumped by means of two Frenier spiral sand pumps (10x54-inch), placed one above the other, to a height of 34 feet, whence it falls by gravity to the sand vats, six in number, 10x20 feet, holding 150 tons each. The sand is evenly distributed in the sand vats by means of Butters & Mein distributors, made of wood, with sheet iron curves. Overflow from rim of sand vats goes to slime vats. The sand as it is deposited in the sand vats gives the following sizing results: On 10-mesh, 12.7%; on 20 mesh, 31.3%; on 40-mesh, 28.2%; on 100-mesh, 20.3%; on 150 mesh, 1.6%; on 200-mesh, 2.4%. Before the sand is charged into the vat the vat is filled with solution, so that overflow and separation of slime commence at once. The vat when filled is allowed to drain slowly for three hours, then barren solution of 0.10% KCy is applied from the top and allowed to soak through. Towards the end percolation is increased, until finally, when the wash waters are applied, the valve is wide open. Treatment lasts five days and then residues are sluiced out.

The overflow from the classifiers, consisting of approximately 20% of the total weight of the ore, is divided as follows: 91.2% amorphous slime, 1.20% remaining on 100-mesh, 2.20% on 150-mesh, 5.40% on 200-mesh. This overflow goes to a small centrifugal pump, by means of which it is pumped to the slime vats, where it meets the overflow from the sand vats. The slime and solution as they enter the slime vats flow down behind a baffle partition (A), about 6 feet long, and extending downwards within 3 feet of the bottom, cutting off a segment of the vat. By means of this the slime settles from the bottom upwards, in place of from the top downwards. As soon as vat is full of solution, an overflow (B) commences opposite the intake of clear solution, which goes to a sump and from thence is pumped back to supply the batteries. Slime is allowed to run into No. 1 vat for twenty-four hours, then the gate is closed and the same process is carried on in No. 2 vat, and No. 1 vat is left undisturbed for two hours. Then syphoning of the clear solution from the top commences. This solution is absolutely clear and goes direct to the gold sump and from thence to the extractors. As soon as No. 1 vat is syphoned down to the slime and the economic point of settling is reached, taking on an average about twelve hours, the syphon is raised and "barren" solution is added by means of a pump and a 2-inch hose; at the same time the plug on the bottom is lifted, allowing connection with a No. 4 centrifugal

pump, by means of which the barren solution and slime are agitated and pumped into vat 3. Proportion of solution to dry slime after decantation is approximately 40% solution and 60% slime. Equal volume of barren solution to the wet slime is added. No. 3 vat, when full, is allowed to settle and clear so-

Arrangement of Cyanide Tanks, Dakota Mill.

lution decanted to battery sump. The remaining slime is pumped into No. 4 vat, with an equal volume of solution "barren," and once more decanted to battery sump. The slime is mixed with water, pumped to No. 5 or No. 6 vat and allowed to settle as long as time will permit. Wash water is used in sufficient quantity, according as it is needed, to keep amount of solution constant. Slime from No. 5 or No. 6 vat, after being settled as long as possible, is run to waste. Assays show an extraction of 85% of the value of the ore on the washed slime, but the actual recovery is about 79%. This difference is accounted for by the impracticability of perfectly washing the final slime. The average extraction for twelve months was 82%, with an actual recovery of 79.8%. Zinc shavings are used as a recovering medium, and practice has shown that it is necessary to put through 33% of the total solution used. The extractors used are of the individual box type, making an arrangement which is easily cleaned up and supervised. The extractors are worked on the principle that 90% of the extraction or precipitation takes place in the top tubs; hence the idea is to run a slow stream into the top tubs and increase the flow in the lower tubs, thereby handling a larger bulk of solution

Arrangement of Precipitation Barrels, Dakota Mill.

to greater advantage. B. C. Cook of the Portland mill, South Dakota, was the first to install this principle. Precipitation, as a rule, is satisfactory throughout the district. The tubs as used are made of barrels—those formerly used for spirits are the best, owing to their being stronger than the usual barrel. Two cleats (iron) are bolted to the side of the tubs, and, when necessary to clean up, an iron yoke is fastened to them and they are lifted and carried by means of overhead gear straight to the clean-up tank. The usual clean-up appliances are generally in use—refining of precipitates with sulphuric acid and fluxing of residues in graphite pots in a wind furnace. Consumption of cyanide per ton of ore is two-thirds of a pound, and this seems about the usual consumption in the district. Consumption of zinc is .75 of a pound per ton and of lime 4 pounds per ton. Actual cost of milling, \$1.10 per ton, on a basis of 120 tons a day.

I have instanced the Dakota mill, not because it presents any new features of the cyanide process, but because it is a fair type of the wet-crushing (with

solution) mills of the surrounding Black Hills district—a process which is eminently successful on the oxidized ores of the Cambrian formation.

This wet-crushing process is somewhat new in the district, and there are yet a number of details to be worked out, e. g., a better extraction, a lessening of costs and a closer saving of values in proportion to the assay value. At the time of writing there are in course of construction some very large wet-crushing cyanide mills whose practice will doubtless eclipse that of the Dakota, and where costs per ton will probably be considerably lower, owing to their larger tonnage and better equipment.

Dry crushing with rolls is also practiced in the district—both fine and coarse crushing. The coarse crushing, about ¼-inch mesh, is only feasible in the siliceous lime of the Carboniferous formation, where, with small equipment of crushing power, a large tonnage can be handled remarkably cheap, and, as the mills are situated at the mines, a very low-grade ore can be handled to a profit.

As regards the fine dry-crushing practice, 12-mesh to 20 mesh, there is not much difference between the practice here and elsewhere. The noticeable points are the almost universal adoption of the 45° angle screen in preference to the revolving or shaking screens. The ores of the district screen very readily, owing to their high siliceous granular nature.

An ingenious device for overcoming dust, as well as helping the treatment, has been adopted by J. O. N. Dorr of Lundberg & Dorr, Deadwood, who mixes the finished product of the rolls as it leaves the bin with a spray of cyanide solution in a mixer, in the center of which is a revolving screw, by means of which the sand is mixed, worked forward to the belt conveyor and transferred to the leaching vats.

Wyoming Topography.

The United States Geological Survey has now ready for distribution engraved maps of the Aladdin quadrangle, Wyoming, the field work for which was completed during the season of 1901. It embraces about 800 square miles of the northeastern corner of Wyoming and includes also a 3-mile strip of the western side of South Dakota. It lies immediately west of the town of Belle Fourche, South Dakota. A 50-foot contour interval was used in drawing the map, and permanent bench marks (at least one in each township) consisting of iron posts with brass caps, upon which the elevation in feet is stamped, have been placed throughout the area.

The Belle Fourche river is the principal stream in this area. This river has its source very near that of the Cheyenne river, and the two streams, starting in opposite directions, eventually encircle the Black Hills region and meet to the east of the hills. Other principal streams in this quadrangle are Hay, Redwater, Oak, Pine and Crow creeks.

The Bear Lodge mountains traverse almost the entire length of the quadrangle and their streams afford water supply for considerable farming along their base.

A fair quality of bituminous coal is mined in the vicinity of Aladdin, although in comparative small quantities. The northern half of the area is devoted to cattle grazing, which is an important industry in that country.

The mapping of this area and of the Devils Tower quadrangle to the northwest (now in course of construction) will complete the mapping of the entire Black Hills uplift.

A topographic map known as the Encampment Special map, embracing about 450 square miles in southern Wyoming, has just been published by the United States Geological Survey. The area mapped is a high mountainous region, ranging from about 6700 to 11,000 feet above sea level, and is crossed near the middle in a north-south direction by the Continental Divide. The map is on a scale of about 1½ mile to the inch. The topography of the region is shown by brown contour lines drawn at vertical intervals of 100 feet, streams and lakes are shown in blue, and houses, villages and roads in black.

The town of Encampment, near the northeast corner, is the center of a rich copper mining district, and its large recently built smelter is supplied with ores from the mines along the Continental Divide, the ores being conveyed from mine to smelter in one instance by an aerial tramway 15 miles long.

The Encampment river is about to be utilized to develop extensive water power near the town.

Tin in the East Indies.

A correspondent of the London Mining Journal, writing from Singapore, says:

"It may interest you to know that on many of the islands extending from Sinkep, which is only a few hours from Singapore (in fact, I have found a little tin in Singapore itself outside the smelters), through Sumatra, Flores, towards Timor, tin exists, and, in some instances in great quantities. But you know the Dutch Government will not let it be worked. I think it is because of swamping the market, or some equally foolish reason. The companies working in Billiton and Banka have to pay 50% royalty; so you can judge of the quantities that exist when people can be induced to work on those terms."

Mining and Metallurgical Patents.

PATENTS ISSUED JUNE 16, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ART OF MAKING STEEL DIRECT FROM IRON ORE.—No. 730,746; M. R. Conley, Brooklyn, N. Y.

In the art of making steel from iron ore, mingling with ore sufficient carbon to essentially combine with oxygen of ore when heated and pass off as carbonic oxide, and melting mass in essentially closed furnace by feeding through heated belt or zone of higher temperature than obtainable in ordinary blast furnace to retaining hearth.

MINER'S LAMP.—No. 730,907; T. Gossack, Belt, Mont.

Hydrocarbon lamp comprising wick tube and burner head having stem projecting at angle thereto and rotatably engaged with wick tube, said burner head having gas openings one side thereof positioned to lie either at upper side or lower side of burner head, corresponding to position to which head may be rotated.

DEVICE FOR CHARGING BLAST FURNACES.—No. 730,922; M. W. Johnson, Jr., Birmingham, Ala.

Combination with scale car to carry load from source of supply and skips to elevate load to furnace, of intermediate vessels adapted to divide and receive load from car and independently deliver same to skips.

PROCESS OF OBTAINING ZINC.—No. 731,184; E. H. Hopkins, London, England.

Process of reducing and collecting zinc by subjecting material containing zinc to heat in presence of reducing agent, excluding air and heating flame therefrom, and conveying zinc vapors into and condensing all of them in mass of heated carbon, from which air is excluded.

CUPOLA.—No. 731,300; T. Holland, New York, N. Y.

Combination with cupola, of air receiver arranged in upper portion thereof, air supply pipe leading into receiver, cold-air supply pipe having portion coiled around receiver, pipe communicating with lower portion of cupola, and pipes leading from receiver to lower portion of cupola.

METHOD OF TUNNELING.—No. 731,198; J. C. Meem, Brooklyn, N. Y.

Method of tunneling, which consists in providing temporary roof support, excavating beneath it and moving it forward rapidly as excavation is completed, positioning permanent roof lagging as temporary support is advanced, positioning wall plates, setting arch segments, blocking up roof from them, digging trench full depth of tunnel and placing section of cradle and masonry therein, and setting arch ribs and spring timbers upon invert thus formed.

DIAMAGNETIC SEPARATION.—No. 731,042; E. Gates, Chevy Chase, Md.

Method of separating diamagnetic substances from mixture containing them, in feeding mixture into relatively intense part of magnetic field, rapidly moving field in direction opposed to feeding of material to increase number of lines of force traversed and continuing material in magnetic field until diamagnetic particles shall have moved outwardly to be separately collected as heads.

SEPARATING DIAMAGNETIC METAL FROM SANDS.—No. 731,043; E. Gates, Chevy Chase, Md.

In separating free particles of diamagnetic metal (such as gold, copper and the like) from other diamagnetic material (such as sand) with which they are

associated, preliminary method of roughly segregating diamagnetic metal from mass, and separating remaining sand from segregated material by admixing particles of magnetic material with mass, enmeshing or entangling diamagnetic metallic particles thereby, concentrating combined metallic particles and diamagnetic particles, and removing remaining sand therefrom by passing concentrate through magnetic field, and diverting mixture of magnetic particles and diamagnetic metallic particles into different paths of collection from that of particles of sand.

DRILL SHARPENING MACHINE.—No. 731,222; J. Retallack, Victor, Colo.

Pair die blocks, one stationary and other movable, blocks being provided in opposing faces with recesses having V-shaped right-angled ribs therein, adjacent walls formed at right angles to walls of ribs, vertical walls at outer edges of recesses having contacting meeting faces forming stops to limit movement of movable die in direction of stationary die.

ORE CAR.—No. 731,242; A. Stucki, Allegheny, Pa.

Ore car having underframe without side sills, and comprising essentially center sills, bolsters, and end platforms having converging sides, body mounted above underframe, provided with outwardly and downwardly opening doors arranged between bolsters.

APPARATUS FOR EXTRACTING METALS FROM ORES.—No. 731,169; C. A. Ellis, El Dorado Canyon, Nev.

Apparatus having hopper provided with inclined bottom, inclined precipitating box connected with hopper outlet, and filtering tank arranged below precipitating box, whereby mixture of pulverized ore and chemical solution may be passed from hopper, through precipitating box into filtering tank, by action of gravity.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence).—There is a report that an extensive paystreak was located on Problem gulch, a tributary to Mystery creek, which is a tributary to Shovel creek. Heavy snow fell last week, and it is presumed that heavy floods will take place in the spring. The thermometer, however, was high during all of last week and it is the opinion of old timers the district will have an early spring. Nome, March 16.

A new placer gold field is reported on Lowe river, 23 miles from Valdez, by E. A. & E. H. Craig and G. C. Wilson. The reports show that there are several hundred acres of gravel from 3 to 30 feet deep, all of which carries values. It is a hydraulic proposition, though in some instances good pay has been made by cradlers. There is plenty of water. The ground located is 3 miles above Wortman's roadhouse, on Lowe river.

The Nome Nugget says the season's developments have shown that at least 6 miles of the Imachuk river, near Candle, carries pay.

On Gold Run creek, near Nome, Sleffert & Gibson have been operating a steam thawer on No. 1 Alder the past winter, and thawers have been used on Gold Run benches by C. F. Rice, A. Dawson, O'Leary & Durand, F. Aldrich and D. Spurgeon and other parties. The benches of Oregon and Hungry creeks have been attracting considerable attention.

Gold is being taken out on Shumak creek, a tributary of Koluk river, near Candle City.

At Mason's discovery claim, in four days' rocking, two hours a day, \$115 was taken out from the river bed in 2 feet of water. This claim is below the canyon. On the gravel bank, 60 feet high, Mason and Van Leer got from one cent to five cents to the pan, says the Nome Nugget. The Lindblom party report having some quartz claims as well as reporting placers. Council reports say work last winter showed gravel beds on the hills of Melsing and Mystery, ranging in depth from 65 feet on the former to 35 feet on the latter, and carrying gold all through. The Neublunk also prospects well.

Manager C. C. Schubert, of the Jualpa M. Co., operating near Juneau, says a 10-ton capacity derrick to be operated by compressed air is being put up at their hydraulic placer mine. The compressor has been set up. The company will have the flume rebuilt.

ARIZONA.

COCHISE COUNTY.

The Bisbee Queen C. Co. will use a diamond drill to prospect their ground near Bisbee, says President B. F. Graham. Meanwhile work continues on the triple compartment shaft.

MARICOPA COUNTY.

The Oro Grande Exploration & D. Co. has bought the Iowa, Texas, Big Six and Brooklyn mines, near Wickenburg, and has let a contract to sink a shaft to water level, says the News-Herald.

MOHAVE COUNTY.

It is reported a body of good ore has been struck in one of the drifts from the 400-foot level of the San Francisco mine, at Cedar Valley. Superintendent Pickering is putting in machinery for the mill and mine, including compressor plant. The mill will be kept running on ore from development work. No stopping will be done for some time.

PIMA COUNTY.

The Arizona G. & C. Co. of New York is building a fifty-ton concentrating plant near the Old Salero camp in Tyndall district, near Tucson, says Superintendent Crow. F. B. Williams is president.

The Banner M. Co. propose building a 100-ton concentrating plant on its ground in the Sierrita mountains, near Tucson. The veins carry copper, lead and silver.

SANTA CRUZ COUNTY.

The Montana mine, near Oro Blanco, will resume under a year's lease by H. W. Squires of Los Angeles, Cal., who is also interested in the McDonald group. The 30-stamp mill at the Old Glory mine is running steadily.

Manager T. F. Kelley of the Arizona Hydraulic M. Co., says they have operations for the summer season under way at their placers near Old Glory.

YAVAPAI COUNTY.

(Special Correspondence).—The Rigby M. & D. Co. are installing a plant of 100 tons daily capacity at Mayer for the treatment of gold, silver and copper ore by the Pöhle-Croasdale volatilization process. In

this process the ground or crushed ore, mixed with the proper proportion of sulphur and sodium chloride, is subjected to an oxidizing roast in an oil-burning reverberatory furnace. The resulting chlorides of the metals are condensed from the fumes in flue chambers and afterwards reduced. It is claimed that the process saves from 95% to 100% of values in gold, silver, copper and lead ores. The company expects to blow in on October 1, 1903. T. J. Rigby is president and manager and H. A. Clark is superintendent.

The Merchants' M. Co. of Yavapai county is shipping one carload of ore per day to the Standard smelter for concentration.

The Azurite group, in Los Prietas mountains, 14 miles southeast of Prescott, is being developed. Hickey & O'Reilly of Prescott are owners.

The 20-stamp mill and cyanide plant of the Golden Link M. Co. at Hillside will commence operations about July 1. Water has been struck and an electric pump installed to raise the water from the Santa Maria river to the mill. An oil pump and tank at Hillside will furnish fuel oil, to be freighted 18 miles to the plant. A large quantity of high-grade ore is clocked out in the mine and on the dumps. Prescott, June 23.

A hoisting plant is to be placed on the Electra mine, the main shaft of which will be sunk to depth of 1000 feet. It is said ore from the claim carries \$15 per ton gold and 10% copper.

The Conger mill, near Jerome, is reported to be in operation again. The ore is obtained from the Etta mine, which has been reopened.

The Oro Fino D. Co., that has taken over the Gold Rock Con. group at Oro Blanco, is refitting the mill building and will put in a cyanide plant, 2 miles south of the McDonald group. The McDonald group of gold mines, in Oro Blanco district, is reported sold to San Francisco men for \$80,000, and first payment of \$25,000 made.

A 50 H. P. boiler is being set up by the Ideal M. Co., operating the Blake group, on Groom creek, near Groomcreek. W. Thessing has put up a whim on his Comet group of eight copper claims in Black canyon, near Prescott, and will sink to water level.

Foreman J. S. Riley of the Gold Link M. Co. group in Santa Maria section, near Prescott, says he expects the 20-stamp mill will be put in operation by July 1st. There is a cyanide plant for treatment of tailings. The ore is wholly free milling and values are said to run \$20 per ton gold. An electric pump has been put in and a pipeline is being laid from the mill to the Santa Maria river, 4000 feet distant. Oil will be used for fuel. The company keeps a large tank full of oil at Hillside station, 18 miles distant, and the wagon tank takes 600 gallons to the mine each trip, says the Courier.

W. H. Bates has bonded the Bullard mines, near Martinez.

The White Horse mine, near Walker, owned by the Monroe Con. M. Co., is reported closed down for an indefinite period.

ARKANSAS.

MARION COUNTY.

The Silver Hollow lead-zinc mine on Buffalo river, near Yellville, has been sold to a Pittsburg, Pa., company for \$75,000. They will erect a concentrating plant and put Silver Hollow on a shipping basis.

A one-half interest in the Ike Emory mine in Warren Creek district for \$5000 has been bought by S. W. Woods, of Yellville. The mill at the White Eagle mine on Buffalo river is in operation. The ore averages 15% mine run and the concentrates assay 60% metallic zinc.

Work on the group of the Philadelphia Zinc Co., near Yellville, is progressing, says J. Douglass, of Cape May, N. J., manager. The company will put in steam drills and, later, a concentrating plant will be built.

The Susquehanna mine near Dodd City district has been leased by R. Sandstrom of Dodd City, who will further develop. He has bought the hoisting plant, and as soon as development work warrants, will put up a concentrator.

SHARP COUNTY.

Work on the concentrating plant being built by the Lisk M. Co. at their Red Fox and King Jack mines, near Smithville, (Lawrence county), is progressing. The plant will be of 100 tons daily capacity.

CALIFORNIA.

AMADOR COUNTY.

At the Kennedy mine, near Jackson, the machinery of the hoist is all in place and the gallows-frame is expected to be finished by July 15th. The mine has 250 men at work.

At the Argonaut mine, near Jackson, a few men are at work fixing the roadway so that material may be hauled to the

mine. The shaft will be repaired preparatory to resuming.

BUTTE COUNTY.

The Gold Bank quartz mine of Forbes-town was shut down last week. It is said to be the intention of the owners to dismantle the plant with which it is equipped. For the past year work has been principally confined to taking out the pillars of ore left behind in former working and to doing prospecting work.

CALAVERAS COUNTY.

It is reported work will be resumed on the Pioneer Chief (the Thorn mine), near San Andreas, next week.

EL DORADO COUNTY.

The Crusader Co. on Mathenas creek, near Placerville, has men at work developing their group, a mile and a half north of the Union mine.

KERN COUNTY.

All the employees of the Yellow Aster M. & M. Co., near Randsburg, numbering over 200, are out on a strike because of a demand by the union for a 50 cents a day increase in wages. The mills have been cleaned up and the mules sent to pasture. The St. Elmo group of the Johannesburg G. M. Co. has shut down and Manager Ericson has gone to New York. The Butte Con. M. Co. men are out, as also those on the Baltic mine. The Santa Ana mine is paying the 50 cents increase asked. C. A. Burcham, part owner of the Yellow Aster mine, says the company will not give in to the demands of the men for higher wages, and that the statement that the Yellow Aster property was or is for sale is in error. The merchants of Randsburg are hesitating before rebuilding the property destroyed by fire.

The Potomac Oil Co., near Bakersfield, is abandoning the use of air compressors in working its wells, and will return to the former method of pumping, says the Oil Reporter.

The Sterling Oil Co. will drill four additional wells on its property at Kern river, near Bakersfield, and is building the rigs. A boiler plant is to be put up. The company is operating a number of wells and is shipping oil.

MADERA COUNTY.

(Special Correspondence).—Preparations are being made to screen and work the dumps of the Gambetta mine at Grub gulch. The workings are down 850 feet. The vein is small, but carries high values in gold, and it is thought a great deal of gold can be recovered from the discarded waste.

An easterly extension of the Josephine vein has been opened up by C. M. Ward & Co., of Grub Gulch, and some good ore is being found. The Josephine was worked to a depth of 600 feet.

A new shaft is being sunk on the Crystal Spring mine at Grub Gulch, and \$150 ore is being found. The vein is small, as yet, however. Some ore has been crushed at the Gambetta mill.

The Savannah mine, south of Fresno river, 2½ miles south of Grub Gulch, is in operation. Development work is in progress.

The mines of this district are chiefly in mica schist and mica slate. The ores are free milling and there is little water in the mines.

Grub Gulch, June 23.

NEVADA COUNTY.

Buck Bros. resumed operations at their German Bar mine at Moore's Flat last week. The ore is free milling. There are three tunnels on the mine.

Near Maybert, the Eastman and Sienop gravel mines are reported bought by G. F. Fowler of Holyoke, Mass.

The 10-stamp mill at the Oustomah mine, near Grass Valley, is in operation, says Superintendent F. S. Morgan.

PLACER COUNTY.

The Hidden Treasure Gravel M. Co., near Centerville, has put in a 15-kilowatt direct connected electric generator for lighting purposes.

PLUMAS COUNTY.

T. Dunn, of Greenville, has bought the Round Valley Con. group of mines, in North canyon, near Greenville. The consolidation consists of five claims. The sale also includes a 10-stamp quartz mill. The tunnel to cut at depth the vein which crops on the surface of the Antelope claim will have to be driven 500 feet farther. In driving this tunnel, the vein, 48 feet wide, in the Phoenix claim of the Johnny Bull group adjoining, was cut. Dunn proposes to build a 40-ton cyanide plant.

F. A. Meidinger, of the Five Bear M. Co., has bought the Centennial mine, mill and water right in Genesee valley, near Genesee, says the Quincy Bulletin. The Five Bear Co. own 4500 feet on the Genesee belt and the Centennial tunnel and mill facilities. The mill will be equipped with a crusher and cyanide plant to treat the tailings after amalgamation. The lower tunnel of the Centennial mine will be driven on the vein for 1000 feet, and an

air compressor and drills for this work will be put in. The Five Bear Co. has located and appropriated the waters of the middle fork of Ford creek at an elevation of 900 feet above the Centennial mill.

SANTA BARBARA COUNTY.

The Mount Solomon Oil Co. was incorporated at San Francisco last week by P. and A. Tognazzini, H. Brunner, S. A. Dana, D. D. Barnard and F. Kronenberg, Jr. They will operate in the L. M. Kaiser land, east of the Pinal Oil Co.'s land, near Santa Barbara. The Kaiser asphaltum mines are on this land.

SIERRA COUNTY.

At Fir Cap, near Nevada City, J. W. Finney, superintendent of the Telegraph mine, has fifteen men at work grading for a mill and repairing the road leading from Downieville so as to bring in a 5-stamp mill, boiler and engine. The mine adjoins the White Bear on the north. J. Collins and M. Flynn, owning adjoining ground in the same locality, are making preparations to do development work and intend running a 1000-foot tunnel to tap the main channel.

TUOLUMNE COUNTY.

Operations in the Denmore mine, on the Stanislaus river, near Columbia, are confined to development work, and only a few men are employed. The mill closed last week, says the Sonora Democrat.

G. B. Lynn has bonded the Sunset quartz mine on Knights creek, near the Dorsey and Newcomer mill, near Columbia.

J. N. and E. W. S. Woods, of Stockton, have bought a half-interest in the Mountain Belle quartz claim, also the Parallel quartz claim, near Soulsbyville. At the Phillips mine, operated by J. Phillips, near the Telegraph Line mine, grading is in progress for a 10-stamp mill.

At the Mohican mine near Groveland, Superintendent F. Chappellat has teams hauling lumber for the improvements at the mine, which consist of an addition to the mill and a new hoist.

There are thirty men at work at the Doyle Ranch gravel mine, near Columbia, where a 125-foot shaft is down and drifting going on. The shaft will be deepened to the bottom of the channel.

The Black Oak G. M. Co. are reported putting in additional machinery at their mine near Soulsbyville.

COLORADO.

BOULDER COUNTY.

A gasoline hoist has been put on in the tunnel of the New National Tunnel M. Co., east of Black Hawk, and increased operations begun. Chicago parties are interested.

The Boulder Illuminating Oil Co. of Colorado Springs propose sinking another hole alongside the former well at Boulder, which was practically ruined several months ago in an attempt to shoot it, says the Telegraph. The well was sunk to depth of 3000 feet and yielded 250 feet of oil.

At Magnolia the Cumberland tunnel is in 1120 feet and shipping five tons of ore per day, says Superintendent Davis, part owner. Work on the India shaft has been suspended until the Cumberland is driven in under the India, when an upraise will be made to connect both workings. This company will take over the Kekionga mine, when air drills will be used.

CHAFFEE COUNTY.

H. S. Smith of Cripple Creek, who has been working the Futurity copper mine, east of Calumet and 40 miles west of Cripple Creek, says ore is being opened up in a drift being run at depth of 300 feet. Assays show 20% copper and \$4 gold.

The Pacific G. M. & M. Co., owning and operating the Gopher and other mines near Granite, has let a contract for sinking the main shaft 200 feet deeper, a total of 310 feet, and from this depth levels will be run off at 200 and 300 feet, opening the ore shoot at these depths, says the Telegraph. In the first level at depth of 110 feet 14 inches of ore running \$88 a ton have been opened. The company has a plant on the ground which, however, will be replaced by one of double the capacity. The hoist will have a lifting capacity from 1000 feet. The Gopher, on which these improvements are to be made, adjoins the Yankee Blade mine on Yankee Blade hill, and the Gillespie claim adjoins the Washington. W. A. Swain of Pittsburg, Pa., is president.

The Salida G. & C. M. Co., E. B. Green president and mill manager, are putting in pulverizing machinery for the copper leaching plant building north of the Salida smelter and near the Sedalia copper mine, which the company controls and will operate.

The Standard M. & M. Co. has been organized by H. R. Chapman and J. C. Schneider of Colorado Springs and H. R. Penfield of Manitou, with W. L. Howe and G. H. Schneider of Chicago, Ill., to operate the Sunrise and Jasper groups at

Granite. They report opening in the main workings a body of gold ore, with hematite, assaying \$10. A new shaft is being sunk which will be continued to 100 feet. On the Sunrise claim the 65-foot shaft has opened a 5-foot vein.

CLEAR CREEK COUNTY.

Manager Reed of the Bonieta mill, near Idaho Springs, has begun work on the addition to the mill for cyaniding the slimes.

A gasoline engine has been put in place on the Wide Mountain group of mines on Leavenworth mountain, near Georgetown, furnishing air and hoisting.

CUSTER COUNTY.

The property of the Melrose M. Co. at Querida has closed down, only the engineers and pumpmen being retained. No cause for the closure is given, says the Post.

A matte smelter is proposed by the Little Bernice G. M. Co., near Custer. A body of ore has been struck, and the intention is to have the ore treated at or near the mine.—At the Golden Cycle mine, J. W. Preston, owner, reports ore being opened up.

The Custer M. & R. Co. has been reorganized and is developing its mines in and about Custer. Work is being done on the first Colorado lode, where at depth of 25 feet gold ore is showing.

Development work at the Keystone M. Co.'s group at Spring Hill has begun. The gasoline engine and hoist have been set up and the gallows-frame completed. The company will also build an assay office.

DOLORES COUNTY.

It is reported N. L. Baumgardner, manager of the Rico Con. M. Co., will begin work on the company's mines near Rico by July 1.

FREMONT COUNTY.

Manager D. C. Jackling of the United States R. & R. Co., operating at Florence and at Canyon City, says the \$150,000 improvements to the United States Zinc smelter at Canyon City will be put in full operation July 1st. Since March 1st the smelter has been hampered by reason of the fire, which burned two bag houses, machine shops, refinery, storehouse and several other buildings. Meanwhile, they have rebuilt the smelter and doubled the capacity. After July 1st, 5000 tons of ore a month can be handled. The product of the smelter in paint pigment will be 750 tons a month. They will have 125 men at work. In making white lead, the gold, silver and copper values are also saved from the ore. At this smelter the ores are burned, the zinc and lead passing off in fumes, which are carried into the bag houses. Here there are hurlap bags 1 foot in diameter and 40 feet high suspended from the roof, into which the fumes pass, driven by compressed air. The smoke is passed through the hurlap, escaping into the chimneys, while the zinc and lead are collected in the meshes of the bags in the form of a fine white powder, which is afterwards shaken down and received into hoppers directly underneath the bags. The product is then taken to the refinery, where it is again subjected to heat and purified. The gold, silver and lead values are recovered by the usual methods of fluxing.

The coal mine at Williamshurg, flooded by rains, was unwatered and operations resumed last week.

GILPIN COUNTY.

R. Hughes of Russell Gulch, with Denver parties, have taken a lease and bond on the Becky Sharp mine in Russell district. They intend putting in hoisting machinery and also suitable top buildings. The main shaft is down 150 feet and will be retimbered and put in shape for sinking.

W. L. Shull of Russell Gulch, with Denver men, has a lease and bond on the Paola mine (to be known as the Phillips mine) in Leavenworth gulch. A frame is being built and it is the intention of the lessees to put in machinery this summer. The main shaft is 200 feet deep and will be cleaned out and retimbered, as also the levels, and development resumed. Ores running 15% copper have been taken out.

The Stanley & Irish mill in Lump gulch, near Rollinsville, has been started up by the Cadillac M. & M. Co., and is running steadily on ores from the Myres and Friend mines owned by the company.

Sinking operations are being carried on with three shifts at the North Star shaft of the Ann Rutledge G. M. Co., in Vermilion district, near Central City. The shaft is down 230 feet, reports Superintendent McMillen.

GUNNISON COUNTY.

The Augusta compressor, near Crested Butte, is running steadily and the tunnel is going ahead. It is in 2400 feet, and nearing the shoot of ore opened in the upper workings. Work on the ore shoot opened last season in the old tunnel has been resumed and ore shipments started. More jacks have been added to the pack

train and packing ore to Anthracite switch is under way. The vein is 4 feet wide and carries 2 feet of high-grade ore with gold and lead values.

The Hercules and Ajax properties in Elko district, near Crested Butte, are resuming. Considerable development work has been done and a 4-foot vein is showing which runs \$160 in gold, twenty-five ounces in silver and 4% in copper.

In Gothic district, near Crested Butte, the Rustler, Copper Creek, Bellview, Gothic and other companies composed of Illinois men principally will operate their holdings. F. L. Clemons, of Canton, Ill., says his company proposes to build a concentrating plant and matte smelter.

LAKE COUNTY.

At the Janson, Neptune and Whale claims in Poverty Flats, near Leadville, owned by Carleton Bros., operations will be begun next week.

E. E. Miner, manager of the Manhattan M. & M. Co., operating at Twin Lakes, is preparing plans for a concentrating mill.

B. C. Reed of Denver, president of the Last Chance M. & M. Co., operating at Twin Lakes, is arranging to build a 100-ton mill, says the Leadville News-Dispatch.

The top works at the Fortune mine, near Leadville, which were destroyed by fire last week, will be rebuilt.

The New Monarch M. Co., says Manager Goodwin, will sink the New Monarch shaft at Leadville 2000 feet. Diamond drill explorations have shown the existence of sulphide below the present 700-foot level of the mine. The shaft will be retimbered from top to bottom and a plant, including five 200 H. P. boilers, will be put up. In the meantime there will be no cessation of productive activity. In the next ten days the Winnie and New Monarch will be outputting 300 tons daily—principally from the first named—some of which will be sent to the Republic plant.

Two compound pumps have been set up at the 660-foot level of the Coronado mine at Leadville. Both pumps have a capacity of 800 gallons, and will be used as a base of operations when the sinking of the shaft begins. It is intended to complete the Midas drift, which has 130 feet yet to go, which will strike a point below the bottom of the Midas shaft, and an upraise will be driven to connect with it.

Manager A. Boyd of the Fanchon mine, near Leadville, expects to resume operations on the company's shaft next week, which will be sunk 200 feet. The company has two of its shafts under lease and steady shipments of ore are maintained.

The Arkansas Valley smelter, near Leadville, is receiving 1300 tons of ore daily. Twenty-three roasters are in operation.

J. C. Ryan has started work on the Madison-Ryan group of claims in Dutch gulch, near Leadville.

MINERAL COUNTY.

Manager J. Nause of the Nelson Mountain M. Co. says operations are resumed at their mines near Creede.

The Chance and Del Monte mines, near Creede, are making shipments of ore and more men have been put at work.

OURAY COUNTY.

C. F. Fishback of Wyoming, with Chicago men, has bought the Torpedo-Eclipse group of mines on Mt. Sneffels, near Sneffels, near the Revenue, the Virginus and the Camp Bird mines and mill. The ore is free milling. Operations will be started July 1st.

Superintendent W. H. Roernaes is preparing to resume on the American mine, 2 miles east of Ironton, up Corkscrew gulch, and expects to begin ore shipments by August 15.

At the San Pedro mine, near Ouray, Superintendent Pierson has men at work and will build 2 miles of wagon road to bring in a compressor, power drills and other machinery. The crosscut tunnel is in 850 feet and driving at the rate of 4½ feet per day.

Superintendent J. S. Reid says operations have resumed at the Bonanza mine, near Ouray, and he will drive with power drills a 1000-foot crosscut tunnel to tap the known ore bodies at depth.

PITKIN COUNTY.

J. F. Willard of Colorado City, manager of the Red Mountain M. & D. Co., reports selling the four Ruby claims of their group to Eastern men for \$30,000. Their mines are in Lincoln gulch, Red Mountain district. There are six claims left, on which the company will increase development work. The State has appropriated \$5000 to build a road from Aspen to Red mountain, which will open the camp. The distance is 20 miles, of which 10 miles have been built by private capital.

SAGUACHE COUNTY.

Manager R. Willis of Colorado Springs says the Mountain Lion M., M. & P. Co. has been organized at Philadelphia, Pa., to develop a group near Villa Grove.

There are three shafts which show streaks of galena ore. The main shaft is down 150 feet. There is a water right which will afford power the year around.

SAN JUAN COUNTY.

C. W. Barry, superintendent of the Big Five M. Co., at Howardsville, reports the Union tunnel is in 900 feet and a contract for an additional 100 feet has been let. The tunnel started into Galena Mt. is in 120 feet.

SAN MIGUEL COUNTY.

L. White reports the Blue Lake vein as being 10 feet wide in the breast and of milling ore. The drift, which is being driven on the ore, is in 270 feet, having out, in its course, the vein of the Fly lode, one of the group crossing the Blue Lake lode. The vein where cut shows 2 feet of ore, with values in silver and gold.

TELLER COUNTY.

The Sioux Falls G. M. Co., which is operating the Fluorine mine, near Cripple Creek, under a five years' lease, is building a 100-ton cyanide plant. It is claimed by Manager Blanchard there is a 75-foot dike of ore that runs \$6 a ton and that this ore can be mined, crushed and treated for a cost not to exceed \$3 a ton.

T. Heslop of Victor is building an experimental cyanide plant on the south side of Straub mountain, 2 miles south of Victor, for Chicago men. If the tests prove satisfactory the mill will be enlarged to capacity of 150 tons daily. It is claimed the company has sixty acres of ground which contain deposits of gravel that averages in value \$2.50 per ton in gold.

Manager S. S. Bernard of the El Paso Con. G. M. Co. at Cripple Creek, says they will sink their three-compartment shaft to 1000 feet, adding 400 feet to the present depth, and will cut stations at 700, 800, 900 and 1000 feet, running out crosscuts from the seventh and eighth levels and opening the vein as soon as the drainage tunnel begins to make appreciable decrease on the water of the Cripple Creek basin. They plan to open the ore shoot found in the main vein in the 600-foot level south of the shaft. The vein is dipping to the west and the ore shoot pitching north, so that at 800 feet it is expected to be directly in the shaft.

Gilbert et al., who own a lease on a block of the Sheriff ground at Windy Point, Cripple Creek, resumed last week. Returns for the last shipment sent out gave them values of \$20 per ton. S. N. Simmonds, lessee, who has been operating on the Zenobia, has also begun working on a lease on the south end of the Sheriff. His lease covers a block which adjoins the Twin Sisters.

Plans have been drawn for a 100-ton addition to the roasters of the Portland mill, at Victor, and work begun, says President J. F. Burns, at Colorado Springs. The addition will give the Portland mill a roasting capacity of 350 tons a day. The new furnace will be a circular one in which the ore is carried about by means of a revolving hearth and is roasted by gas generated in the center. The rabbies are stationary and work the ore in a spiral movement. Oil is used for fuel.

The Merrimac Con. M. Co., at Cripple Creek, have leased their ground to Eastern parties for two years and given rights to use the company's workings. There is a shaft 75 feet deep which will be sunk to 250 feet, from which levels will be run out to cut the C. K. & N. vein, which is thought to extend into that property. Machinery will be put in at the Merrimac and development work increased. A second lease will be granted on another block of ground, adding a plant of machinery to that end of the property. The company owns Woodman and Columbia claims on Beacon hill. E. E. Armour of Denver is president.

Development on the Thompson mine of the Elkton Co. at Cripple Creek, says Lessee Wright, who is operating on the ground, has opened up ore, which is being broken from three distinct shoots, and the entire product averages \$20 per ton. The ore in the Apple Ellen shoot has been opened in the 500-foot level and a drive is being made to this body in the third and fourth levels. This shoot averages 3½ feet in width. The Thompson shoot in the Elkton vein is being broken 20 feet in width, which returns values of \$13 per ton. The Thompson shoot in the Walter vein is averaging 3½ feet in width of \$20 rock.

The Chicago Leasing Co., which has a three years' lease on the Hoosier mine, on Tenderfoot hill, near Cripple Creek, has decided to deepen the main shaft, down 487 feet, by 200 feet. Levels will be run at 587 and 687 feet on the vein. J. K. Walsh is manager.

GEORGIA.

DUFFY COUNTY.

The Georgia-Montana G. M. Co., composed of J. F. Cowan, G. H. Casey, C.

Hand and others, has taken a 10-year lease and bond upon a gold property, 37 miles northwest of Augusta. The claim is near the Columbia mine which has produced considerable gold. The mine has not been worked since 1860. It was nearly full of water and partly caved in when the Montana men took hold of it. It is a fissure vein in mica schist. The shaft is down 150 feet. On the 100-foot level the ore shoot is 300 feet long and the vein at the face of the level is 17 feet wide. The ore averages \$10, and is free milling. At the 150-foot level ore running \$30 per ton in gold has been taken out. Wages are 75 cents to \$1 per day for common laborers, mostly negroes. It is the intention to put up a stamp mill. The mine makes fifty gallons of water per minute.

IDAHO.

BLAINE COUNTY.

A. Ford, superintendent of the Ohio Co., operating placer claims on the South Boise river, near Hailey, has begun operations. He has a hydraulic giant and 1000 feet of 11-inch pipe.

At the Tyrannis mine, in Little Smoky district, near Hailey, what ore has been extracted to date will be put through the concentrator and shipped, after which operations will be suspended until fall.

CUSTER COUNTY.

Mackay reports tell of a gold strike on Beaver creek, 40 miles above Mackay. The vein is 3 feet thick and runs \$60 per ton.

ELMORE COUNTY.

Near Mountain Home, the Elmore group of mines has been sold to G. McCargo of Pittsburgh, Pa., and I. E. Rockwell of Chicago, Ill., for 20,000. The group consists of seven patented claims at Rocky Bar. It is equipped with hoisting works and a 50-stamp mill. M. F. Leech is superintendent and has started development work.

C. D. Morgan of Boise says mining operations around Atlanta and Rocky Bar are increasing. At the Pettit mine eighteen men are at work, and at the Big Lode Superintendent S. Oglesby is opening up the mine. W. S. Brown is working men on the Minerva group and expects to use twenty miners all summer.

IDAHO COUNTY.

C. H. Fish has bonded a group of sixteen claims in the Marshall Lake district, near Grangeville. Veins have been opened which assay from \$18 upward. Mr. Fish also holds contracts on some other property in the district. If values are maintained at depth, he will put in a plant for reducing the ore.

E. B. Stewart has a bond on claims near the Jewel, near Grangeville. Considerable development work has been done. The ore is high grade.

In El Dorado mining district, near Collins Hot Springs, near Stites, the F. Stickmer group of claims has been bonded to L. D. Lively & Co. of Lewiston for \$6000. Work is under way.

S. McKibben of Elk City, superintendent of the mines owned by the Thunder Mountain G. Co., says they will put in a 5-stamp mill at the mine, which is 60 miles east of Stites and 10 miles east of the American Eagle mine.

OWYHEE COUNTY.

Work is under way on the Imperial and Lucky Gus claims, owned by the Imperial M. & M. Co., of which A. Munzing of Akron, Colo., is president. Superintendent T. Fry has men at work sinking the shaft.

SHOSHONE COUNTY.

The Sunflower M. Co. has incorporated at Huron, S. D.; G. M. Adams, Jr., J. D. Meldinger, P. Lawrence, W. Dohl, S. S. Johnson, W. J. Harris and M. Hoke. The company is engaged in placer mining and has a number of claims near Pierce City.

The Simmons property in Bear gulch, 8 miles from Murray, has been bonded to Toledo, Ohio, people for \$250,000. At the depth of 265 feet there is said to be 23 feet of concentrating ore which carries silver and lead. The property is 5 miles from the Hercules. There are nine claims in the group. The new company will build a wagon road to the mine 2 miles long.

MICHIGAN.

HOUGHTON COUNTY.

The management of the Osceola mine, near Calumet, is said to be preparing to sell its Tamarack, Jr., shafts to the Calumet & Hecla. The territory is thoroughly worked out, but the shafts would be valuable to the Calumet & Hecla at a part of its mine where drifts 3000 feet long have no ventilation other than air coming from drills.

The management of the Copper Range railroad is building its tracks up the Atlantic sands, near Houghton, to the mouth of Cole's creek, the site of the new Copper Range smelter. Superintendent F. I. Cairns has begun preliminary work on the

smelter. There will be five reverberatory furnaces, three melting furnaces, 18x50 feet, and two casting furnaces, 15x32 feet. Everything will be automatic. The mineral will be dried by waste gases. Going into the top of the furnaces the metal will be drawn off at the bottom without dipping. There will be one cupola for reducing slags from the furnaces. The smelter will be worked on a combination of Western and lake methods. There will be a special refining process to get rid of arsenic or other deleterious substances in the metal, says the News.

The Michigan Smelter Co. has been incorporated at Houghton by L. L. Hubbard, F. W. Denton, J. H. Rice, A. F. Rees, R. T. McKeever. The principal office of the company will be in Boston, Mass., and the Michigan office at Houghton.

Improvements being made at the Quincy mine, at Hancock, will be finished in the fall, after which it is expected that Nos. 2, 6 and 7 shafts will each furnish a daily rock output of 1100 tons. This would insure monthly rock shipments of 95,000 tons. Rock shipments for May aggregated 74,000 tons and the product of refined copper was \$30 tons. The skips of five and one-half tons capacity each are being replaced by ones of improved design of seven and one-half tons capacity. The large skips have been in use at Nos. 6 and 7 shafts for several months. The underground system of electric haulage north of No. 6 shaft is giving satisfaction.

ONTONAGON COUNTY.

C. H. Taylor, consulting engineer of the Victoria mine at Victoria, says the mine will be worked by compressed air, the air compression being made by means of falling water. It is calculated that the plant will maintain a pressure of 140 pounds of air to the square inch. The Victoria's water power canal is being cut hydraulically by opening the dam and sweeping the material out through the water gates. The tram road from the mine to the mill site is being cut a distance of 4200 feet. The grade runs from 6% to 12% and the cars will be operated by cable. The shaft has reached the nineteenth level. All even levels are being driven to the south to the site of the new shaft 1100 feet from the present one. When these levels are through that shaft will be cut by an up-raise.

MISSOURI.

MONITEAU COUNTY.

In the lead and zinc district around Fortuna there are twenty shafts going down and additional hoisting and pumping machinery has been put in, says the Lead and Zinc News. Several mills are being built. The Youngstown L. & Z. Co., after sinking four holes, are preparing to sink their shaft. The Woodyard shaft is down 135 feet and will sink to 150 feet, at which point their drill records showed ore. Shaft No. 2 on the Wolf tract is down 90 feet and a drift will be run out from their No. 1 shaft. A steam hoist has been set up on the Rochester and sinking resumed. The Horseshoe shaft is now down as far as it can be driven without heavier pumps.—At the Bluff Springs mine underground work is again under way. The mill is also in operation. This company's second shaft is down 50 feet. A peculiarity of this is said to be the fact that a deposit of coal is being worked, furnishing more coal than is required to operate the power plant, and with the coal zinc ore is being mined. Occasional pockets of lead are found.

Work on the King Jack mine, near California, is progressing, the mine being opened up preparatory to building a mill.

MONTANA.

BEAVERHEAD COUNTY.

T. Stevens, of the Indian Queen mine, in Birch Creek district near Dillon, says the smelter was blown in last week. The Indian Queen mine is 12 miles from Apex, the nearest railroad point, and all the coke and supplies used at the smelter will have to be hauled in. High-grade glance is obtained in the mine.

D. Wadams, owner of the Saginaw group of mines in Big Hole basin, near Dillon, on which a shaft to 300 feet has been sunk, says development work will be increased this summer. The Saginaw has 15% copper in sight and a considerable tonnage of low grade ore on the dump, but the long haul to the railroad is expensive. A matting furnace may be built at the mine in the fall.—The reports of a railroad line in the Horse Prairie section have increased prospecting and other work in the mines of the Bloody Dick district.—Only one dredger plant is working in the county this season, that of the Horse Prairie Co., near the Brenner ranch on the head of Horse Prairie, near Dillon.

CHOTEAU COUNTY.

W. Meadowcroft reports drilling operations for oil under way on Swift Current

river, north of Havre. Within 13 miles of the company's ground and across the Canadian line are several producing wells.

DEERLODGE COUNTY.

During the month of May at the Amalgamated C. Co.'s Washoe smelter at Anaconda the output was far in excess of any previous month, says Superintendent Mathewson. The big plant turned out 13,570,000 pounds of copper bullion. The company has its own refinery for this product. There are 2000 men employed at the works in all branches of both mill and smelter, while 200 more men are at work on the flue and chimney being built. The ores from the company's mines contain values in gold and silver and twice each month a quantity of gold and silver bullion is shipped.

LEWIS AND CLARKE COUNTY.

E. C. Braden of Helena, Western representative of the American S. & R. Co., and manager of the East Helena and Great Falls smelters of that company, says they have blown in a new stack at the East Helena smelter and now have three running. The Great Falls smelter is idle. There is not enough ore for both to operate, and they run the least expensive plant.

MADISON COUNTY.

Last week operations were begun on the Elkhorn-Iola mine by A. C. Sandes of Minneapolis, Minn., who has a lease and bond on the group. A 12 H. P. gasoline hoisting engine has been placed on the Elkhorn shaft. This shaft is down 60 feet, with a short drift from the bottom and one at the 40-foot level.

The Little Kid mine, 17 miles from Norris, has been bonded to J. P. Ormond, J. Hore, H. Bush of Jardine and E. A. Dawes of Livingston for three years. A 10-stamp mill, a 20-ton Bryan mill, saw-mill and quarters for the employees go with the bond. The bonders propose building a 100-ton concentrator.

PARK COUNTY.

The Kimberley-Montana Co., at Jardine, expect to have the cyanide plant and new mill complete by July 1, when work will start in the mines.

The St. Julian G. M. Co., near Livingston, has elected W. A. Bercy, president; J. F. Nolan, first vice; A. F. Peck, second vice; P. J. Nolan, secretary and treasurer. The company will erect a 10-stamp mill on their property at Emigrant this summer.

SILVER BOW COUNTY.

Preparations are being made by W. A. Clark to install at his Original mine in Butte an air compressor plant built on the two unit plan. This plant will be large enough to supply all his other mines around Butte, which will be connected by pipelines.

The foundations for the Garretson smelter of the Pittsburg-Montana C. M. Co. at Butte are being put in place. Some machinery for the plant is on the ground. It is expected the works will employ 700 men.

The Emma mine, near Butte, which has been closed for several weeks, is being reopened and a smelting plant will be built.—The Travonia mine, owned by W. A. Clark, has been abandoned, the ore having given out.

The Roins Copper Co. of Butte and Pittsburg, Pa., men, formed to work the Combination mining claim in Meaderville, have begun sinking the shaft an additional 500 feet. This will give a total depth of 1000 feet. Heavy hoisting machinery has been put in. G. W. Stapleton of Butte is vice-president.

NEVADA.

ELKO COUNTY.

The Dexter mine at Tuscarora last week shipped its first bar of gold bullion under the new management, being the output of forty stamps dropping on an average of 100 tons of ore daily, says Manager E. O. Lee at Salt Lake City, Utah. The water struck in the mine is receding rapidly, says Superintendent Taylor. It is proposed to add a slimes plant to their equipment similar to the one at the Con. Mercur Co. at Mercur, Utah. The plant will have a capacity to treat 100 tons of slimes tailings daily to start with and later be increased to 200 tons daily.

ESMERALDA COUNTY.

The Oro Blanco M. Co. has been organized to work four claims adjoining the Montgomery Bros. group in Lida district, 22 miles southeast of Silver Peak. C. H. Elliott, A. F. White, H. H. Brown and T. J. Fitzsimmons are incorporators.

M. H. Seely has bought five claims 10 miles south of Silver Peak and 6 miles from Oasis.

LINCOLN COUNTY.

L. H. Outzen of Richfield, Utah, president of the Annie Laurie Extension M. Co., with L. Neilsen, has a bond on a group of five copper claims 40 miles down Meadow Valley gulch, from Calientes for

\$25,000, running eighteen months. There has been a smelter on the ground and the ledge opened up for 6000 feet. Between the lime and porphyry walls the vein is 50 feet wide and in the center is a 2 foot pay streak. Assays show values in silver and copper. On August 3 Outzen will start work, sinking on the vein. The Clark road will pass 7 miles from the mine.

The E. & F. M. Co. at Jack Rabbit, near Calientes, on the San Pedro route, report two ore strikes in Badger ground, one at depth of 60 feet, where 4 feet of lead ore has been opened; the other 1000 feet distant, where 7 feet of ore is shown. An average of the ore shows twenty-two ounces silver, 20% lead and 80 cents gold per ton. High-grade copper ore from the main workings is being shipped.

At Newberry mountain, 18 miles south of Searchlight and near the California line, the Badger group of mines and the Wisconsin group are being operated under bond by S. F. Dexter of Pawtucket, R. I. The Juniper group is also being worked by Rhode Island parties.

The New Era M. Co., near Searchlight, have begun work on their mill, which will consist of two 5-stamp batteries. A supply of water can be obtained from the Boland well, 1500 feet away, which the company owns.

The Manhattan M. Co., near Pioche, E. F. Freudenthal of Salt Lake City, Utah, manager, report high-grade copper ore opened up in the tunnel on their Stampede group, 8 miles southwest of Pioche. The ore also carries values in gold and silver. A gasoline hoist will be placed in the tunnel and sinking begun on the vein.

NYE COUNTY.

The General Thomas claim at Lone Mountain, and six adjoining claims, have been bought by J. C. Gladden and associates of Salt Lake. The General Thomas claim has 280 feet of work upon it. The ore is lead carbonate, running about 60% lead and from \$30 to \$40 in silver. The dumps contain about 500 tons.

STOREY COUNTY.

The Best & Belcher Co. has leased its mill, near Virginia City, to the Butters Cyanide Co. for crushing rock from the Hale & Norcross dump, the pulp from which will be flumed to the Butters plant in the canyon. The Best & Belcher Co. reserves the right to crush ore in the mill from the mine whenever it may be required for that purpose, says the Enterprise.

WASHOE COUNTY.

The Springfield-Nevada M. Co., in Olinghouse canyon, near Wadsworth, I. Miller, manager, are putting in two 54-foot Huntington and a 30 H. P. gas engine. This is expected to increase their milling capacity by fifty tons per day. The equipment will be moved to mill No. 2, thus doubling its capacity for the treatment of ore from their Slip and Renegade mines.

WHITE PINE COUNTY.

C. B. Frost, manager of the Wild West group of mines at Cherry Creek, says lumber and machinery for their stamp mill is on the ground, and he expects to have it in operation by August 15. In the meantime ore is piling up on the dump.

NEW MEXICO.

LINCOLN COUNTY.

A carload of machinery for the Eagle M. & Imperial Co. of Parsons has arrived at Capitan. The plant consists of crusher and concentrator. Additions to the plant are anticipated.

The Old Abe at White Oaks is installing new machinery. The Montezuma Co. was recently incorporated to develop mines in the White Oaks region.

TAOS COUNTY.

It is stated the Keystone M. Co. will build a smelter to treat the ores for its nineteen claims in Bromide district, 12 miles from Tres Piedras. The ore carries values in gold, copper and silver. J. P. Rinker is superintendent.

At Twining, the Frazer Mountain C. Co.'s smelter is in operation, says Superintendent O. W. Alexander, and making an output of 10,000 pounds of copper daily. The concentrating mill is running steadily. The company has thirty men at work. The mines, smelter and mill are connected by inclined plane and by a wagon road up the canyon. The plant includes concentrator, mill, smelter, charcoal furnaces and lime kiln. Work is progressing in the mine in three places. There is a tunnel in 600 feet and the vein is 20 feet wide. The ore carries some gold and silver, also.

VALENCIA COUNTY.

At the United States land office in Santa Fe, W. N. Houser of Denver, Colo., for the Phelps, Dodge Co., filed eleven coal declaratory statements for 320 acres each in southwestern part of Valencia county, 15 miles east of the Arizona line, says the Albuquerque Journal. This district is 50

miles north of the Dittl range in Socorro county, also north of the Mogollon range and northeast of the headwaters of the Gila river.

OREGON.

BAKER COUNTY.

W. H. Potter has been employed by the Virtue Con. M. Co. to remove the hoisting and milling plant of the Cumberland mine, Silver City, Idaho, to the Virtue mine, 8 miles east of Baker City. The Virtue Co. owns both properties. The Virtue is equipped with an old hoist and 20-stamp mill.

Work on the Oro Fino of the Cove district is to be commenced by J. C. Clark, owner.

The incorporators of the Victor M. Co. are A. Geiser, H. T. Hendryx and E. Parker. It will be known as the Cracker Creek G. M. Co. The president of the company will be C. A. Blesser of Philadelphia, the main office of the company being in that city, and a branch office at Spokane, Wash., wherein A. G. Hanauer will hold the office of secretary and treasurer. A compressor plant and large gasoline engine is to be installed.

The management of the Golden Wizard mine, near Sumpter, propose building a 100-ton concentrator and cyanide plant. Superintendent McPhee says the Wizard vein is being drifted on at the rate of 5 feet a day.

W. C. Bass, superintendent of the Maxwell mine, near Sumpter, states that the mill has resumed after undergoing repairs. A winze is being sunk from No. 15 to No. 18 level, a distance of 300 feet, while work is being continued on No. 15. The Maxwell carries sulphide ore.

H. H. Ames of the Morning mine, Greenhorn, states that his company has commenced operation of their mill, a 5 foot Bryan, and two tables. With this equipment ore will be treated from the upper levels.

GRANT COUNTY.

The Helenora Con. M. & M. Co. of Alamo is a newly incorporated mining company. The property of the new company is near Alamo. The incorporators are L. W. Waugh, J. E. Stewart and H. E. Hendryx.

SOUTH DAKOTA.

PENNINGTON COUNTY.

The Lakota G. M. & R. Co. is reopening the Grizzly Bear mine, near Hill City. The mill has been entirely removed, and will be replaced with a combination stamp and cyanide plant.

LAWRENCE COUNTY.

The Hidden Fortune 60-stamp mill, on Whitewood creek, below Deadwood, is running full capacity on the low-grade ore from the siliceous belt, mined on North Lead hill. The company is mining ore on the Durango for delivery at the mill. Arrangements have been made at the Durango whereby the St. Patrick, Sula and other adjacent claims may be worked from one point. A tramway has been built by the company, so equipped that sixteen ore cars may be loaded on the Burlington track without shifting them. Sinking has resumed in the Bingham shaft of the company where the hoisting plant was burned last winter. The hoisting machinery has been replaced. The shaft is 280 feet deep of three compartments. The timbers were destroyed to a depth of 150 feet by the fire and these have been replaced. At the 300-foot level a crosscut will be started on the Bingham vein.

The Gold Eagle M. Co. has been organized at Lincoln, Neb., by R. O'Neill, C. Y. Smith, G. M. Smith, J. P. Hymer, with J. Hawgood, Terry, S. D., manager, and J. C. Noland, Maitland, superintendent. The company has taken over 130 acres of mineral land near Maitland, adjoining the Penobscot M. Co., and is north of and 3 miles distant from the north line of the Homestake. The ore is free milling.

UTAH.

BEAVER COUNTY.

The Gold Run M. Co. has been incorporated at Salt Lake City by J. C. Dick, C. DeMelsey, A. R. Tierman. The company owns a group of fifteen claims in Bradshaw district.

Work has been resumed in the Old Hickory tunnel of the Majestic C. Co., near Milford, with twelve men, and the electric drill is cutting out 3 feet per day. The tunnel will reach a connection with the new shaft this week, says Superintendent Osborne. Both at the Old Hickory and the O. K. the electric drills are said to be working satisfactorily.

At the Majestic C. Co.'s smelter near Milford, the period of construction work is nearing completion, says Manager W. A. Farish of Salt Lake City. The dust chamber, 250 feet in length, is being built, while the trestlework will be finished next week. In the meantime the directors

propose to build a line of railway between the O. K. and Hickory and the smelter, and another between the Harrington-Hickory-Vicksburg group and the plant, a distance of 16 miles.

IRON COUNTY.

The Colorado Fuel & Iron Co. is reported to have thrown up its principal options on iron mines near Cedar City, owned by the estate of T. Taylor; J. C. Cutler Jr. manager.

All right, title and interest of the Ophir M. & M. Co. to the Ophir group of claims at Stateline, including all improvements, was sold at sheriff's auction to the Detroit Trust Co. for \$105,577. The milling plant at the Ophir mine is said to have cost \$100,000 and is equipped to treat ore by cyanide process after a slight roasting. The ores carry values in gold and silver.

JUAB COUNTY.

J. Dern, a director of the Lower Mammoth mine, near Eureka, says the work of sinking the shaft is finished to the 1200-foot level and a station is being cut at that point.

The Illinois M. Co., north of Eureka and adjoining the Raymond M. Co.'s ground, have given an option on their mines to F. J. Westcott of Salt Lake City.

PIUTE COUNTY.

(Special Correspondence.)—The Mount Baldy M. & Water Power Co. was organized in Marysville this week. The company is composed of J. Patton, New York City, president; R. De Witt, vice-president; C. P. Barnson, Junction, Utah, secretary and treasurer; D. L. Page and S. J. Robbins, with the officers, as directors. The company has a group of claims 3 miles south of Ten-Mile creek, and about 12 miles from Marysville, where a large porphyry belt extends through the country. The veins are fissures and samples taken indicate satisfactory results. In silver the values run from a trace to 167 ounces. In gold, \$2 40 to \$228.40. The company has bought a quarter section of land on the Sevier river on which they will erect an electric power plant to furnish power for milling purposes. A boarding-house, bunkhouse and assay office will be erected and a large force of men employed. R. De Witt will have charge of the development work and J. Bowers the assay department.

It is reported that G. F. Dalton of Salt Lake has a bond and lease on the Wedge property and will begin operations.

The Iron mine east of town continues to ship two cars of iron ore daily. Superintendent King reports the ore body developing and the values improving. Added facilities are being made to increase the output.

L. Nelson of Richfield has taken a 1000-foot contract on the Snow Bird, situated on Brigham peak.

H. L. Glenn and C. V. Gilmer of Salt Lake, Utah, have a bond and lease on the Dalton mine on Bullion creek.

The mountains east of Beaver are the scene of another gold excitement. The discoveries are near Blue lake at the foot of Mt. Baldy. S. Reinhardt brought down the samples and reports this week. There is abundance of water for milling purposes and plenty of timber. The discoveries are 5 miles from Gold mountain.

The four mining districts surrounding Marysville, the Ohio, Mt. Baldy, Gold Mountain and the Sevier River, are active this year, which promises to be a productive one. These districts can be reached by the Denver & Rio Grande Western Railway from Salt Lake City, which has its terminus at Marysville.

S. F. Mount, who has a bond and lease on the L. & M. group, near Marysville, expects to begin shipments next week.

Marysville, June 21.

SALT LAKE COUNTY.

The capacity of the Utah Con. M. Co. smelter at Murray, says Manager R. H. Channing, will be increased by 300 tons per day. At present the plant is handling an average of 515 tons daily. The work of enlargement will not interfere with the operation of the present furnaces and the usual output of copper, gold and silver bullion will be maintained.

Negotiations for a sale having fallen through, the owners of the Dewey mill in Bingham canyon, near Bingham, will reopen it for operations, says Manager R. Bemis of Salt Lake City.

Twenty acres of ground of the West Mountain Placer M. Co. have been leased to the Utah Co., operating the Wall group at Bingham. This will be used as the site for the proposed concentrator of 500 tons daily capacity, says Manager D. C. Jackling. In addition to leasing the land, the copper company has bought the pumps put in by the placer company, having a capacity of 1500 gallons a minute. They also have an option on the entire placer holdings of the West Mountain Co.

SUMMIT COUNTY.

N. Treweek, manager of the Wahash mine at Park City, reports the main shaft

down 600 feet, and from this point 5000 feet of underground workings have been run, which consists of crosscuts, drifts, upraises, etc. At present they have thirty men at work prospecting and developing this portion of the mine. Two veins of ore are showing.

At Scott hill, near Park City, ore shipments have been resumed by the Scottish Chief mine.

W. H. Crockett and W. A. Dennis are driving a tunnel on the Harwood group, in McHenry canyon, near Park City.

Manager M. Somer of the Portland-Park M. Co. says arrangements have been made to start development work on their group at Park City.

TOOELE COUNTY.

Shipments of quicksilver are being made from the Sacramento M. Co.'s retorts at Mercur.

Superintendent C. Rich says the continuity of its ore-bearing veins in the Indianapolis group, near Stockton, having been determined, the company will tap them through a tunnel, and have begun driving from a point down in the gulch, and it is estimated that they will have to go 700 feet to cut the ore at 700 feet on the dip.

UTAH COUNTY.

By "quit claim deeds" to the Sunday Lode M. Co. have been conveyed the Sunday lode mining claims on Miller hill, in American Fork canyon, near Provo.

State Coal Mine Inspector G. Thomas estimates that the number of men employed in the Utah mines of that class aggregate 3500 men, and that the daily output is 6500 tons, says the Deseret News.

WASHINGTON COUNTY.

Manager Beveridge of the Dixie mines and smelter, near St. George, says the company has decided to enlarge their smelter, which they expect to do this season. Additional ore bodies have been opened up underground.

WASHINGTON.

FERRY COUNTY.

W. F. Newton, manager of the mines of the Mineral Hill Con. M. Co., at Danville, says additional machinery will be put in. The company owns thirteen lode claims. The company also owns the Morrison placers, of 182 acres, on the west side of Mineral hill. A double-compartment shaft will be sunk 300 feet, and for that purpose a 60 H. P. hoist, and a 5-drill air compressor and power drills will be used.

Manager M. R. Staught reports work resumed on the Peacemaker and Eureka Fraction claims, near Republic, and he will begin sinking a shaft. These claims adjoin the Quilp on the southeast.

LINCOLN COUNTY.

The management at Spoken of the Crystal mine, near the mouth of the Spokane river, near Davenport, report they will have a 60-ton smelter ready for blowing in by Aug. 15th. J. Gray, superintendent of the mine, will have charge of the smelter. It is intended to smelt ore not only from the Crystal, but for other mines in that section, including the Deer Trail.

STEVENS COUNTY.

Near Kettle Falls, the Columbia River M. Co. are shipping ore to the smelter.

WISCONSIN.

GRANT COUNTY.

W. S. Grant, of the State Geological Survey, with a party of six men, is making a survey of the lead and zinc section of southern Wisconsin, beginning at Platteville.

WYOMING.

CARBON COUNTY.

(Special Correspondence.)—The shaft on Mohawk claim of the Chicago-Venture M. Co., near Battle lake, is down 150 feet and a station will be started before July 1. Native copper shows in foot wall. The Mohawk has a contact vein showing 11 feet of leached gossan and is said to be similar to the Ferris-Haggarty ore. Grand Encampment, June 22.

FOREIGN.

AUSTRALIA.

NEW SOUTH WALES.

Sydney reports give the gold yield of New South Wales during May at 10,832 ounces, valued at £39,921. The yield for the first five months of 1903 was 85,096 ounces, valued at £311,577.

QUEENSLAND.

Brilliant Block Gold Co., at Charters Towers, give the estimated value of bullion from the company's cyanide works for month of May at £640.—Brilliant Central Gold, at Charters Towers, crushed during May 2925 tons of quartz for yield of 2443 ounces of gold; value of cyanide

bullion, £2074.—Mungana (Chillagoe) May output was 2001 tons of ore, containing 96½ tons copper, 15,072 ounces silver and 325 tons lead.

WEST AUSTRALIA.

The Associated Northern Co., at Kalgoorlie, has ordered a reduction plant for the Iron Duke lease. The new mill comprises Gates crushers, ball mills, and a desulphurizing furnace.

Diamond drilling is still carried on in the Iron Monarch, another of the company's blocks, east of the Brownhill. The first borehole put down from the surface to a depth of 1040 feet passed through 30 feet of payable oxidized ground, and a second hole is being drilled to confirm this.

BRITISH COLUMBIA.

The Ivanhoe mine's flume, near Sandon, has been repaired and the concentrator started up again, shipments also resuming.

The Iron Dollar claim, south of the Oro Denoro, in Summit camp, Boundary district, has been bought by the Oro Denoro, Ltd. Considerable work has been done on the Iron Dollar and there is a showing of copper. R. H. Anderson, superintendent of the Oro Denoro, has men doing railway work. The company is also quarrying ore. Two spurs from the C. P. R. will be run into the quarries on the Denoro, from which shipping ore can be taken.

Manager Rogers of the Nickel Plate group in the Similkameen, near Keremeos, says they will put in a complete electric plant to light the mines, mill, etc., and furnish power.

Kaslo reports say F. Marquis and G. Gilbert claim to have made a gold quartz find on the Gold Park group of two claims on Poplar creek, a tributary of the Lardo river, the claims being 20 miles from Lardo and 1 mile from the railroad.

After being out sixteen weeks the coal miners at Ladysmith have given up the strike and agreed to resume work immediately under the contract existing before the start of the trouble. The men have abandoned the Western Federation, which has furnished little or no support, many now being on the verge of starvation. It is expected the miners of Cumberland will take the same course.

The Snowshow mine, near Phoenix, has 100 men on the payroll. When coke can be had at the Boundary Creek smelter in sufficient quantity more men will be used and an increased tonnage started. The output amounts to 500 tons daily. Ore is being shipped from several parts of the mine, including the new Glory hole, near the end of No. 2 railway spur. On the main incline shaft the work of timbering to the third level and below is finished and rails laid for the 2-ton skips. The 150 H. P. electric hoist is ready for use and is expected to be in operation by July 1. This week shipments were started from the Jumbo mine, near Rossland, says M. R. Galusha, managing director.

J. D. Bone, of the Case Investment Co., of Tacoma, has taken a boring plant into the Nikola district, near Ashcroft, to prospect for oil.

W. Thompson, consulting engineer for the Victory-Triumph Co., is preparing for further operations at the Victory-Triumph group on Sophie mountain, near Rossland. A shaft will be sunk on the Triumph fraction. Previous development consisted of a drift on the vein within the Victory lines.

The output of coal from the Morrissey mines of the Crow's Nest Pass Coal Co. is being increased, and it is expected will by July 1 reach 1000 tons daily. Coal bins, to contain slack coal for manufacturing into coke, will be built at the upper end of the coke ovens. They will be so arranged that lowries can be run in under them to be filled with coal and drawn to the ovens. These bins are being built large enough to contain the supplies of coal for not only the 250 coke ovens, but also for the 500 additional ovens proposed.

CANADA.

ALBERTA.

At Blairmore two coal mines are operating, says the Rossland Miner. The International Coal & Coke Co. has twenty men at work and has arranged to build several coke ovens for testing the coal. Proctor & Fishburn are mining two cars of coal per day.—In Frank the Canadian-American Coal & Coke Co., under Superintendent Geho, is taking out a car of coke daily. Thirty-four men are at work opening up the old tunnels and sinking near the townsite. Arrangements are being made to open up a ledge a mile northwest of the town. Previous to the recent slide the company was producing 20,000 tons per month for the Canadian Pacific Railway.—Near Frank a French company under Manager J. Fleutot is operating with 100 men and firebrick is being shipped in to build coke ovens.—Eight miles east of Frank are the Byron Collieries, Ltd., owned by London and Paris parties. A spur has been built to

the Canadian Pacific Railroad and the company is working thirty men. No machinery is yet in position, but it is expected the mines will be equipped and coke ovens built.

PHILIPPINE ISLANDS.

The Phillipsburg (Mont.) Mail says from Bagio, Benguet, J. D. Hartwell writes that a strike of gold ore was recently made 2 miles from there. The ore is pyritic and the lead 40 feet wide. Average samples assayed \$18 in gold. J. Turrell is working the mine. There are several copper prospects near there that carry gold values and 10% copper.

KLONDIKE.

Dawson advises say the hydraulic plants put in last summer in the Klondike district are proving satisfactory. On Fox gulch the Anglo-Klondike M. Co., owning a large area, in three weeks during May handled more dirt than 200 men could wash out in a year under ordinary conditions. A block of ground 205 feet long, 150 feet wide and 30 feet deep was worked out, yielding good returns. The entire plant is operated by four men, using water under 125-foot pressure. Sluicing is maintained day and night, says Manager G. Coffey. The cleanup will not be made until the end of the summer. Other plants have been shipped north this spring for installation near Dawson.

MEXICO.

CHIHUAHUA.

Parral camp is now producing 50,000 tons of ore monthly, which would be increased if cars to transport it could be furnished.

At Santa Eulalia the Chihuahua M. Co. has laid a pipe line to its mines and put in a large pumping plant.

A lease and bond on the Fourth of July mine, near Parral, has been given to the Saginaw M. & M. Co., who will sink 200 feet. This mine adjoins the Two Republics.

It is claimed that oil has been found on the Batopita river, in the western part of Chihuahua.

The Stillwell Mining Companies, I. Ragaz manager, have commenced work on the Germania mine in Parral district. An option was taken on this property recently by the Stillwell Companies. The property consists of 45 pertenencias adjoining the Refugio mine.

MEXICO.

Another strike is reported by the Belen M. Co., near Ocampo, and operations have resumed at the mill.

SAN LUIS POTOSI.

Los Charcos M. Co., composed of Monterey men, has bought the Oriental mine near Los Charcos. The mine is 10 miles from the nearest railway, and the ore carries silver and copper. The property is an "antigua," and the present owners have a 40-foot shaft sunk on the vein. It is intended to make three levels before the shipment of ore is begun. E. W. Pitt, at Los Charcos, is superintendent.

SINALOA.

(Special Correspondence.)—The Minas del Tajo at Rosario has 600 men at work, 85 of whom are in the 60-stamp mill. The mill handles 160 tons of ore per day. The ore carries gold and silver. The pulp from the batteries is run into settling tanks which take out the coarser portion, the slimes being run off into larger settling tanks. From the tanks the settled pulp is shoveled into pan amalgamators by Mexicans, after which it is run onto concentrators. The mine has been worked to depth of 650 feet, the ore body being 300 feet wide, and containing occasional lenses of high-grade ore. The company is sinking the shaft in the hanging wall country to tap the ore zone at 1000 feet in depth, and they are down 700 feet. J. Bradbury is manager.

Rosario, June 20.

SONORA.

The Alsacia M. Co. are to erect a smelter near their mines in the Ajo mountains. J. Herman, of Herman & Newitt, is at the mine. He is making a thorough analysis of the ore to determine the kind of furnace necessary. The mines are on the northwest slope of the range and about 25 miles from Cananea.

The following summary of the output of the Green Con. Co. Cananea smelter and concentrators for the month of May is given by the Cananea Herald: Tons ore smelted, 26,322; pounds of copper produced, 4,167,127; cost per pound, 6 cents; total construction cost, \$69,700; tons of ore milled at concentrator, 10,507; mining cost per ton, \$1.12; tons concentrates produced, 3797; total paid for labor, \$195,000.

The Alonso Morgado mine, near Carho, has been sold to J. R. Arohibald for \$25,000.

TAMAULIPAS.

The Waters-Pierce Oil Co. has a con-

cession, with an exemption from State and Federal taxation for seven years, for the erection of a plant at their refinery in the port of Tampico, for the extraction of paraffine from crude petroleum. The company will invest \$100,000.

PERSONAL.

J. D. COPLIN has returned to Denver, Colo., from Kansas City, Mo.

L. W. VIDLER has returned to Georgetown, Colo., from Denver, Colo.

A. BENTON of Parra, Chihuahua, Mexico, was in Denver, Colo., last week.

J. N. GREGG of Redding, Cal., is in San Francisco, Cal., on mining business.

C. P. COLLINS of Bradford, Pa., has returned from a trip to Denver, Colo.

THOMAS DERBY of the New Almaden quicksilver mines is in San Francisco, Cal.

R. CHAUVENET of Denver, Colo., is examining mining property near Phoenix, Ariz.

T. RILEY, of Peal, Larimer county, Colo., has returned there from Denver, Colo.

F. L. EWING, a mining man of Yuma, Ariz., is in San Francisco, Cal., on business.

J. C. CAMPBELL, interested in mines near Nevada City, Cal., is in San Francisco, Cal.

W. C. HOWARD has returned to San Francisco, Cal., from placer mines in Columbia, S. A.

M. P. STRONG of Pueblo, Colo., is examining mines on Bullion creek, Plute county, Utah.

C. W. BARRY is superintendent of the Big Five M. Co., at Howardsville, San Juan county, Colo.

M. HICKEY, owner of the Azurite group of mines near Prescott, Ariz., is in San Francisco, Cal.

SYDNEY REEVES has returned to San Francisco, Cal., from the Gambetta mine, at Grub Gulch, Cal.

S. FISHER, superintendent of the Golden Gate mine, near Sonora, Cal., is visiting in Los Angeles, Cal.

W. B. MILLIKEN is manager of the F. M. Davis Iron Works Co.'s metallurgical plant at Denver, Colo.

F. H. CLARK of the Trade Dollar Extension Co. is in Salt Lake City, Utah, from Silver City, Idaho.

J. BRADBURY is manager of the Minas del Tajo, at Rosario, Sinaloa, Mexico, vice A. F. Grigsby, resigned.

F. M. MURRAY of the Franklin M. Co. is at Marysville, Utah, looking after the interests of his company.

S. WILLEY, interested in mines near Rochford, S. D., returned last week from an extended visit in Illinois.

E. L. WHITE of Boston, Mass., president of the Bingham Con. C. Co., is at the mines at Bingham, Utah.

C. E. KNOX, manager of the Montana-Tonopah M. Co. has returned to Philadelphia, Pa., from Tonopah, Nev.

J. J. BROOKS has resigned as superintendent of the Bannie mine, near Prescott, Ariz., and will go to California.

W. H. ANDERSON of Aspen, Colo., is superintendent of the Bassick mine, near Silver Cliff, Custer county, Colo.

W. H. HOLDERMAN has accepted a position as assayer with the Henry Bradburn M. Co., at Marysville, Utah.

H. H. NICHOLSON, M. E., of Denver, Colo., has returned from examining mines in the Black Hills, South Dakota.

C. H. TAYLOR is consulting engineer for the Victoria C. M. Co., with mines at Victoria, Ontonagon county, Mich.

G. K. FISCHER, constructing engineer of the Utah Con. C. Co. of Bingham, Utah, is in Colorado Springs, Colo.

G. H. ROBINSON, manager of the Tintic M. & Dev. Co., has returned to Salt Lake City, Utah, from Chicago, Ill.

G. RICHARDS is superintendent of the Puntner mine, near Sonora, Tuolumne county, Cal., vice H. J. Dykes, resigned.

A. E. DRUCKER, assayer and mill superintendent at the Minas del Tajo, at Rosario, Sinaloa, Mexico, is in San Francisco, Cal.

G. L. KAEDING, E. M., of San Francisco, Cal., is in Jackson county, Or., examining mining properties. On his return

he will spend several weeks in Shasta and Siskiyou counties, Cal., visiting properties there in which he is interested.

A. F. GRIGSBY has resigned as manager of the Minas del Tajo, at Rosario, Sinaloa, Mexico, and has gone to San Francisco, Cal.

C. A. BURCHAM, part owner of the Yellow Aster M. & M. Co., at Randsburg, Kern county, Cal., is in San Francisco, Cal.

PRESIDENT A. B. LEWIS of the Royal G. & C. Co., operating near Milford, Utah, returned this week from a short trip East.

J. P. EVANS of the Colorado Iron Works, Denver, Colo., has returned to Denver from San Francisco, Cal., via Los Angeles.

H. M. CROWTHER of Salt Lake City, Utah, managing director of the Blue Acre C. Co. of Beaver, Utah, is traveling in California.

MANAGER T. F. KELLY of the Arizona Hydraulic M. Co. is at the mines near Old Glory, Santa Cruz county, Ariz., from Chicago, Ill.

F. I. CAIRNS is in Houghton, Mich., from Bridgeport, Conn., to assume charge of building the smelter for the Copper Range Con. Co.

B. F. GRAHAM of Bisbee, Ariz., president of the Bisbee Queen C. Co., has gone to Kansas City, Mo., and Chicago, Ill., on company business.

SUPERINTENDENT BABCOCK of the Equitable mine, in Flower district, near Virginia City, Nev., has resigned and gone to San Francisco, Cal.

J. BROOKS of Park City, Utah, is superintendent of the Sheba mine, south of Mill City, Humboldt county, Nev., vice J. C. Hessel, resigned.

W. J. LAWRENCE returned last week to Salt Lake City, Utah, after inspecting developments on the Lawrence Con. in Elmore county, Idaho.

W. H. ALDRIDGE, manager of the Canadian Smelting Works at Trail, B. C., returned last week from a visit to Ottawa and Montreal, Canada.

M. R. STAIGHT, manager of the Peacemaker-Eureka group of mines near Republic, Wash., returned last week from a business trip to New York.

W. F. SNYDER, president and manager of the Glasgow & Western Exploration Co., returned to Salt Lake City, Utah, last week, from a trip East.

J. H. JACOBSON, president of the Latham M. Co. of Spruce Mountain district, Nev., returned from camp to Salt Lake City, Utah, last week.

H. K. WHEELER of Los Angeles, Cal., has returned from a two weeks' trip in Arizona, where he has been examining gold and copper properties.

A. H. DANFORTH, formerly with the Colorado Fuel & Iron Co. of Denver, Colo., is manager of the Hidden Fortune M. Co., near Deadwood, S. D.

J. T. MORROW has resigned as superintendent of the smelter at Great Falls, Mont., and has gone to Cananea, Sonora, Mexico, for the Cananea Con. C. Co.

D. C. JACKLING of Salt Lake City, Utah, manager of the Utah Co.'s Bingham mines, made a short business trip to Anaconda and Butte, Mont., this week.

H. G. NICHOLS has resigned as assistant superintendent at the Standard Con. M. Co., at Bodie, Cal., to take charge of the Republican mine, near Jacksonville, Tuolumne county, Cal.

W. H. THOMAS, consulting engineer for the B. C. Copper Co., owning the Mother Lode mine and smelter at B. C., after spending two months in the district, has returned to New York.

H. T. POWER, superintendent of the Hidden Treasure drift mine, Placer county, Cal., has been appointed by Governor Pardee of California a trustee of the State Mining Bureau, vice F. G. Drum, resigned.

R. P. JARRIS, E. M., for the past three years superintendent of the Compania Metalurgica de Torreon in Mexico, and formerly assayer of the Bi-Metallic Smelting Co. of Leadville, Colo., has been appointed professor of mining in the New Mexico School of Mines at Socorro, N. M.

Books Received.

"Solar Heat" is the title of a pamphlet of 160 pages by Charles H. Pope, A. M. It deals with the history of the utilization of solar heat, from the days of Archimedes

to the present. The volume contains numerous illustrations and is an interesting treatise on the practical and economical application of the heat of the sun to industrial usages.

Catalogues Received.

"The Diamond Drill and Its Work" is the title of a handsomely illustrated and valuable pamphlet on the above subject issued by the American Diamond Rock Drill Co. of 95 Liberty St., New York City. It contains a record of work accomplished with their drills, the adaptability of the diamond drill and a price list of the various types and sizes of machines.

The Crocker-Wheeler Co., manufacturers and electrical engineers, Ampere, N. J., in an interesting little pamphlet of 16 pages, entitled "The Source of the Electric Light," show a complete line of electric light and power generating plant equipments. The descriptive matter enumerates the requirements of a commercial electric current and the important features in the design and construction of such machinery.

The Stillwell-Blerce & Smith-Valle Co. of Dayton, Ohio, in their "General Pump Catalogue, No. 53, 1903," issue of 114 pages, show an extensive line of air and circulating pumps, boiler feed pumps, compound and condensing pumps, power pumps (duplex and triplex), electric, geared, heavy pressure and hydraulic pumps, heaters, filters and purifiers, and Victor turbines. It is finely illustrated and contains, also, various tables of capacities and other specific information necessary to hydraulic calculations.

Commercial Paragraphs.

THE American Engineer & Foundry Co. of 433 Mateo St., Los Angeles, Cal., report that they are manufacturing the Lane slow-speed improved roller mill.

THE F. M. Davis Iron Works Co. has opened an ore testing plant and metallurgical department at 1737-39 Champa St., Denver, Colo. W. B. Milliken is manager.

THE Economist Gas Engine Co., of San Francisco, Cal., report shipping last week two gas engines for pumping plants—a 10 H. P. to San Jose, Cal., and a 23 H. P. to Winters, Cal.

THE Union Gas Engine Co. of San Francisco, Cal., report shipping last week a 5 H. P. geared hoist to Hilsdale, Ariz. They also report a 5 H. P. ship's hoist for shipment to Alaska.

THE Elaterite Roofing Co. of San Francisco, Cal., report shipping a carload of roofing to Tonopah, Nev.; also a carload of the same material to Pocatello, Idaho, to be used on mine buildings.

THE Mine & Smelter Supply Co., Denver, Colo., write that they have orders for a large hoisting and pumping plant for Pearl, Colo., also four Huntington mills and a set of 14x27 Davis rolls for Leadville, Colo.

THE Sullivan Machinery Co. of Chicago, Ill., has issued a handsome wall hanger in tints, illustrating the various types of machinery manufactured by them, including air compressors, rock drills, hoisting engines, diamond drills, etc., each of which is handsomely illustrated in its several types. The descriptions are printed in both English and Spanish.

THE Ingersoll-Sergeant Drill Co. of New York state the Cleveland Stone Co. has recently placed with them an order for a compressed air plant, which will be located at the stone company's No. 6 quarry, North Amherst, Ohio. The building will be 80x130 and the plant complete will cost \$130,000. The plant will comprise two large Ingersoll-Sergeant Corliss condensing air compressors, 48 inch stroke, semitangye frames, having a combined capacity of 9215 cubic feet free air per minute. Steam and air ends are compounded and of the highest refinement in economy throughout. Also, three Stirling water tube boilers, 258 rated H. P. each, to carry 180 pounds working steam pressure; two independent jet condensers, two duplex boiler feed pumps, two duplex auxiliary low-service pumps, three Roney mechanical stokers, one fan draft, water purifier system, etc., including some 10,000 feet of large air pipe and fittings as the main feeder around the quarry. This plant will give a cubic foot of air at less cost, they say, than any other plant in the world, and it is to be a notable one in many ways. It is expected to be in operation by September next. Among the machinery to

be handled are nine powerful hoisting stations, handling twenty-two derricks, fifteen channelling machines, fifteen rock drills, pumps, blacksmith fires, steam hammer, grindstone and shop engine. So many radical changes over the whole system of quarrying are in contemplation that it may be expected to increase the output 25% to 50% with the same labor force, cut down the coal consumption two-thirds and cheapen the cost of production to a very material extent.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPHERICAL PIPE JOINT AND STUFFING-BOX—No. 731,159. June 16, 1903. W. F. Boardman and F. H. Jackson of San Francisco, Cal., said Jackson having assigned to Byron Jackson of the same place. This invention relates to an improvement in what are known as "ball" or "spheroidal" joints for pipe couplings; and it consists in the application of a stuffing-box whereby a tight joint may be maintained in this class of joints whatever turn or change of angle may be made and means by which two spherical segments of the joint may be held together while the gland may be removed and the packing adjusted.

EDUCATIONAL DEVICE—No. 731,175. June 16, 1903. J. T. Coodman of Alameda, Cal. This invention relates to improvements in mechanical devices for facilitating study in numbers, letters, word construction and the like on the part of little children. Its object is to provide a simple, entertaining, indestructible and inexpensive means for presenting subjects of study to the beginner in lieu of the ordinary text books.

THEATRICAL STAGE—No. 731,094. June 16, 1903. H. W. Bishop, San Francisco, Cal. This invention comprises the combination with the stationary portion of the stage, of a revolvable central portion upon the same plane, with means for setting scenery so that a plurality of settings for different scenes may be arranged upon the table. In conjunction therewith are means for revolving the table so as to bring any desired scene to the front, means by which the accessory portions of the stage both above and below the main level may be revolved in unison with the revolvable floor of the stage, and means for connecting electrical wires between the stationary and movable portions.

LIFE BOAT LAUNCHING APPARATUS—No. 731,143. June 16, 1903. S. H. Ury, San Leandro, Cal. The object of this invention is to provide a simple means by which a boat may be lowered gently, safely and rapidly. It comprises the combination in a life boat launching apparatus, of upright supports secured rigidly to a ship's rail, with having curved portions pivoted to said uprights, means for holding the ways vertical, boat-supporting shoes embracing the ways and slidable thereon, pivoted boat-supporting bracket arms on said uprights, means whereby the boat may be transferred from the bracket arms to the ways, spring-actuated brake bars hinged to the outer ends of said ways and means for supporting the ways when in inclined position from the sides of the vessel.

OIL BURNER—No. 731,133. June 16, 1903. F. Saffell, Fresno, Cal., one-half assigned to R. J. Powers of San Leandro, Cal. This invention is especially designed for the burning of heavy unrefined petroleum oil in conjunction with steam, and a means for supplying and mixing the steam and oil before it reaches the point of ignition. It consists in an apparatus adapted to be employed in conjunction with stoves or like-heating apparatus, and comprises a device for furnishing the steam, a device into which the steam thus furnished and oil are delivered, and a means for intimately mixing the steam and oil before they arrive at the point of ignition.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JUNE 16, 1903.

- 731,011.—GRAINING MACHINE—B. W. Augustine, Alameda, Cal.
- 731,094.—THEATRICAL STAGE—H. W. Bishop, S. F.
- 731,157.—CAN BODY MACHINE—H. L. Black, Oakland, Cal.
- 731,325.—BAIT BOX—N. B. Anchet, Pendleton, Or.
- 731,159.—PIPE JOINT—Boardman & Jackson, S. F.
- 731,285.—HYDRAULIC RAM—H. Culpan, Alms, Or.
- 731,169.—EXTRACTING METALS—O. A. Ellis, El Dorado, Nev.
- 731,175.—EDUCATIONAL DEVICE—J. T. Coodman, Alameda, Cal.
- 730,910.—CAR COUPLING—G. C. Harlin, Seattle, Wash.
- 731,364.—TRACTION APPARATUS—A. A. Honey, Tacoma, Wash.
- 731,365.—TRACTION APPARATUS—A. A. Honey, Tacoma, Wash.
- 731,189.—HORSE CHECK—S. W. M. & G. L. Kollock, Tacoma, Wash.
- 730,934.—FURNACE FEEDER—J. C. Leary, S. F.
- 731,311.—RULE OR SCALE—W. F. Leavell, Castile, Wash.
- 731,380.—BOILER—L. I. S. Mayhew, Whatcom, Wash.
- 730,954.—GATE LATCH—O. E. McEwen, Lowell, Wash.
- 730,949.—FISH TRAP—Miller & Wallace, Fairhaven, Wash.
- 730,957.—WRENCH—A. Newell, Pasadena, Cal.
- 731,320.—SAND GUARD FOR RAILROADS—J. P. Newell, Portland, Or.
- 731,589.—ALCOHOL HEATER—E. R. Plummer, Los Angeles, Cal.
- 731,130.—WELL—M. D. Rochford, Los Angeles, Cal.
- 731,133.—OIL BURNER—F. Saffell, Fresno, Cal.
- 731,084.—REFLECTOR—H. H. Taylor, San Jose, Cal.
- 731,329.—CAN OPENER—H. Till, Tucson, Ariz.
- 731,143.—BOAT LAUNCHING APPARATUS—S. H. Ury, San Leandro, Cal.
- 731,355.—GAS REGULATOR—C. C. Wilson, Alameda, Cal.

Latest Market Reports.

SAN FRANCISCO, June 26, 1903.

METALS.

SILVER.—Per oz., Troy: London 24½d (standard ounce, 925 fine); New York, bar silver, 52½c, refined (1000 fine); San Francisco, 52½c; Mexican dollars, 41½c San Francisco, 41c New York.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50@14.75; Electrolytic, 1 to 3 casks, \$14.50@14.75; Casting, 1 to 3 casks, \$14.00; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £56 7s 6d spot per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £11 15s 0d per long ton=2.75c per lb.

SPELTHER.—New York, \$6.25; St. Louis, \$4.85; London, £19 5s 0d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$28.12½@28.27½; San Francisco, ton lots, 29½c; 500 lbs., 30c; 200 lbs., 30½c; less, 31c; bar tin, 32½c @35c. London, £127 spot.

PLATINUM.—San Francisco, crude \$18.00 ½ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$44.50@46.00; large lots, London, £8 15s; San Francisco, local, \$45.00 ½ flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 3½c.

SOLDER.—Half-and-half, 100-lb. lots, 19½c; San Francisco, Plumbers', 100-lb. lots, 16c.

NICKEL.—New York, 50@60c ½ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$19.85 @20.25; gray forge, \$18.60; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$29 50@30.50; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

OILS.—Linseed, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw, bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 23½c; Elaine, 26½c; Water White, in bulk, 14½c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzene, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 65c; Bleached do., 70c; Whale Oil, cs., 50@55c.

CANDLES.—Granite 6s, 16 oz., 40s. 10½c ½ set; 14 oz., 40s., 9½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 24@25c ½ lb.; carloads, 23@24½c; in tins, 35c; soda ash, \$2.00 ½ lb. 100 lbs.; hyposulphite of soda, 24@25c ½ lb.; caustic soda, in drums, 3@3½c ½ lb.; Cal. s. soda, bbls., \$1.25@1.50 ½ lb. 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb tins; borax concentrated, 7@8c ½ lb.; roll sulphur, 4@6c; powdered sulphur, 2@3c; flour sulphur, French, 2@3c; alum, \$2.00@2.25; California refined, 2@2½c; sulphide of iron, 9c ½ lb.; copper sulphate, 5@7c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 2½c ½ lb.; nitric acid, in carboys, 8c ½ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ¾c lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @9c per lb.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

BORAX.—Concentrated, 7@9c per lb powdered, 9@12c; fused, 25@30c.

BORAX.—Crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ½ lb., 60c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

BISMUTH.—Subnitrate, per lb., \$1.60.

SODIUM.—Metal, ½ lb., \$1.00.

MERCURY.—Bichloride, ½ lb., 90c.

PHOSPHORUS.—(American) ½ lb., 75c.

SILVER.—Chloride, ½ oz., 90c@1.00; nitrate, 55c.

ALUMINUM.—No. 1, 99%, small lots, 37c ½ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$3; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Obituary.

J. P. MUNSON, a pioneer mining man and surveyor, died June 16 at Placerville, El Dorado county, Cal. Deceased was born in New York, October, 1824. Though an orphan at nine years of age, by working his way he made the most of high school and academic opportunities there, and later went to the lead mines at Dubuque, Iowa, afterwards to the Lake Superior copper mines. Coming in 1852 to El Dorado county, Cal., he engaged in surveying, mining and teaching, and served three terms as Superintendent of Schools. He is survived by a widow and two sons.

SITUATIONS WANTED.

A MINE SURVEYOR, AN ASSAYER AND Analytical Chemist, with a thorough acquaintance with the cyanide process and a graduate of a leading mining college, is open to engagement. The best of references furnished. Address Box 558, Los Angeles, Cal.

A YOUNG MAN WITH 12 YEARS' PRACTICAL mining experience wants position where the ability to do things and doing them will lead to advancement. Can assay, survey, run engine or pumps, sharpen tools, or do anything about a mine. Bave some mill experience. References given. Address R. J. S., care of this office.

ASSAYER OR SURVEYOR. TECHNICAL graduate with considerable experience at present located in Coeur d'Alenes, desires permanent position after June 20th. References. Address Geo. A. Snow, Mullan, Idaho.

ASSAYER AND CYANIDE MILLMAN desires position. References Address "Assayer," care of Mining and Scientific Press.

CAPABLE ENGINEER OF GOOD STANDING and experience would like to purchase an interest in an established engineering business—mining or civil. Only a business capable of expansion and doing high grade work is desired. Address "Experience," care of Mining and Scientific Press.

EXPERIENCED ASSAYER, ANALYST AND Draughtsman desires position with mine, mill or smelter. Excellent references. Speaks Spanish. Address "Metallurgist," this office.

FIRST-CLASS METALLURGICAL CHEMIST and Assayer desires position. Can furnish best of reference, etc. Address C. W. L., this office.

MECHANICAL ENGINEER—HAVE A UNIVERSITY education and am an all ar. and practical mechanic. Four years experience in steam and hydraulic engineering; have designed an up-to-date blast furnace; have been connected with large copper mine for two years; good references. Prefer large gold or copper mine; foreign country preferred. Address A. B. C., care Min & Sci Press.

MINE SUPERINTENDENT WANTS POSITION with a substantial company that has a mill on property. A qualified mining engineer who can run a mine or mill, cyanide plant, assaying and surveying. Address "Mining," this office.

MINING MAN OF 14 YEARS' EXPERIENCE. Thoroughly familiar with modern mining methods. Expert mill, cyanide and chlorination man. References. Address B., this office.

MINING ENGINEER, 26, GRADUATE MINING Department University of California; for past thirteen months employed by one of largest mines in Mexico as head assayer and chemist, also mill assistant; after took charge of 60-stamp mill and hacienda. Has had some experience in mining, cyaniding, surveying, drafting, and good experience in pan amalgamation. Best of references from both general manager and superintendent where last employed. Address 1666 Page St., San Francisco.

FOR SALE.

One 14½x26x20-in. Cross Compound Engine.
One No. 12 Morris Centrifugal Water Pump Direct connected with 10x10 Vertical Engine.
One No. 10 Morris Centrifugal and Pump Direct connected with 10x10 Vertical Engine.
One 4½x2½x6-in. Single Acting Blake Pump (outside packed).

Write for prices and complete information.
THE BUCYRUS CO., SOUTH MILWAUKEE, WIS.

ASSESSMENT NOTICES.

MARINA MARSGANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1903, an assessment (No. 36) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 1st day of August, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of August, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office—415 Front street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of May, 1903, an assessment (No. 37) of one-half (½) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 214 Pine street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 20th day of June, 1903, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 11th day of July, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. DIXON, Secretary.
Office—Room 31, 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 37) has been postponed to SATURDAY, the 11th day of July, 1903, and the day of sale from the 11th day of July, 1903, to TUESDAY, the 28th day of July, 1903. By order of the Board of Directors.

The FRUE VANNER with Brownell "PATENT LIP" Flange Belt

stands for everything that is good, desirable and reliable in concentration. The FRUE VANNER is the STANDARD by which ALL OTHER concentrators are judged. If you buy some other concentrator you MAY get satisfactory results. If you buy a FRUE VANNER you are SURE to be satisfied. You get a durable machine of the highest capacity that gives a clean concentrate with the least possible loss in the tailings. The FRUE is furnished with the Brownell "PATENT LIP" FLANGE BELT. This is the best and highest priced

belt on the market. There are over 1700 of them now in use, and we have plenty of testimonials to show that after seven years' constant wear they are still without a break in the flange. All the largest Mining and Milling plants on the Pacific Coast, and in all parts of the world, have adopted them. Machines are made in four and six-foot widths, and furnished with either plain or corrugated belts. We supply either wood or iron carriage frame, as may be desired.

FOR DESCRIPTIVE PAMPHLETS, ADDRESS

JAS. S. BROWNELL, Western Manager **FRUE VANNING MACHINE CO.**,

Westinghouse Induction Motors

Being sparkless, dust and water-proof, occupying little room and requiring no skilled attendance, are particularly adaptable to driving all kinds of mining machinery. Their efficiency and economy are too well established to need comment.

Circular 1050 gives particulars.

Westinghouse Electric & Mfg. Co.
Pittsburg, Pa.

San Francisco, 425 Market St.; Seattle, 314 Occidental Ave.; Los Angeles, 323 S. Main St.; Salt Lake City, 151 S. Main St.; Denver, Mountain Electric Co.; and other large cities.
